When we consider those breeds which are popular to day, we find that each has some particularly good quality to recommend it. Amongst the non-sitting breeds, Leghorns, Minorcas, Anconas, Andalusians, Houdans, and Campines are the most popular, and all are excellent layers; then amongst the heavier breeds the Wyandottes are splendid layers, and the Rocks extremely hardy and good layers and fair table birds, and the Langshans lay beautifully coloured eggs and a good number of them; and Dorkings are largely kept for crossing to produce table birds of good quality.

And then we have the popular Orpington in all its varieties, which has become the most popular of all breeds, and is more largely kept than any other for utility purposes, as well as for show, which owes its popularity entirely to its combination of excellent laying and table qualities with a pleasing appearance.

At one time Brahmas and Cochins were largely kept, not only for show, but for home use. These have been superseded by breeds which have good table qualities, flesh of fine texture, and good flavour, and by much better layers; and at the present time these breeds are only kept by a few who adhere to their original fancy for the heavily-feathered birds or for showing.

Then the Black Spanish are almost extinct, as they were bred with such large white faces that in time many of the birds became blind, and their appearance being studied in preference to their useful qualities, they deteriorated from good layers into very indifferent birds, and to-day are dying out.

Then the Spangled and Pencilled Hamburgs were kept by very many people years ago, and we considered the most profitable lays to be obtained then. Now they have been entirely superseded by breeds which lay larger eggs, and are only kept for exhibition, save in a few cases where people have become attached to them, and keep them merely because they are fond of them, and put up with their small eggs. There are several other breeds which are going down in popular favour on account of their deterioration in useful qualities.

Huddersfield October Cattle Fair was held on Thursday, when the number of animals penned was 299 horses, 479 beasts, and 43 pigs, against 272, 345, and 38 at the October Fair of 1905. The prices realised were as follows:—Best draught horses, £50 to £100; ditto secondary, £25 to £30; best Hackneys, £35 to £45; secondary kinds, £25 to £30; best milch cows, £14 to £18; seconds, £10 to £13; stirk, £5 to £8; fat cattle, 5d. to 6d per lb.; store pigs, 12s. to 16s.

Round the Borough.

Is it possible to discern a ray of brightness struggling to pierce the clouds that have hung over us during the last month? I rejoice to hear that more inquiries are being made this week, and that offers of business have been more numerous.

Although there is present very little definite light, there is certainly a ray of hope which encourages me to look forward to further development, and the possibility of the establishment of steadiness in the position, which has recently been sorely wanted. As "the drowning man clutches at a straw," so I welcome the slightest indication of reaction, and of a check to the ruinous downward slide from which we have suffered. It is at such a critical moment as this that the faith and strength of holders will be tested.

Some of them are getting tired of waiting, as I hear of pressure to sell, that is not a good sign. If buyers have arrived at the conclusion that perhaps the bedrock is reached, we shall soon see some revival of demand. It is this we require, and if such movement can once be started it will not be long before stability will be attained, and improvement in values will certainly follow. But (and there is much hanging on to this little word) the business is entirely in the hands of the brewers. Some hops have been bought by merchants at moderate prices, and if they can sell them with profit they will buy again, and the trade will be generally stimulated.

On the other hand, should the persuasive powers of their travellers be insufficient to secure orders, their hands will be crippled, and the market will feel the distressing effect. It seems therefore that growers would be well advised to wait the issue of events, they can hardly lose by a further exercise of patience, and it is just on the cards that they may gain.

In the meantime it must be admitted that the immediate situation is as unsatisfactory as it can be. It is hardly safe to quote prices, as the tendency towards depressing is too evident. We cannot now hear a whisper of the quotations with which the new market opened. Day after day rumours of lower, and still lower figures are circulated.

Sales of excellent hops are reported at 45. I am credibly informed that offers of 90s. are being made, with the prospect in some cases of this cruel price being accepted. The larger and more substantial planters are, however, not yet opening their samples, and as the bulk of the crop is in their hands, their decision must have some influence when they make up their minds to move.

We are waiting with some anxiety the publication of **The Official Returns**, which are due within the next few days. Many opinions are expressed, and some betting is passing as to the figures.

As far as I can gather, it is thought by traders that the published returns will probably be somewhat below the actual crop. These annual estimates are never accepted with much respect, as it is known that the system of estimating is not reliable. Planters are under no obligation to make returns, and the whole matter is settled by the estimators, who are not sufficiently remunerated to make it worth their while to devote much time to their enquiries.

Nevertheless, as this is the only official declaration, we expect it with a certain show of interest, and shall doubtless be in possession of such information as it affords before another week has passed.

Foreign News.

America.

The volume of business in hops continues to be very small, both in the town markets, and the country districts. Buyers and sellers are wide apart in their views of value, but the general tendency is downward, and it is expected that no activity will be aroused until the demands of growers are considerably reduced.

The harvest in New York State being concluded, estimates of the crop are fairly reliable. From the Waterville district it is reported that the yield is from 15 to 20 per cent. higher than last year, while the Cobleskill returns show that there is a reduction from last year of about 20 per cent. From all sections we are informed that the quality is exceptionally good, the cones are rich in lupulin, and, with the assistance of favourable

weather, the harvest has been gathered in prime condition.

Nuremberg.

Although a large amount of business has been done, the supplies are more than sufficient to meet the demand, and during the past week values have receded to the extent of from 5s. to 10s. The reduction is more marked in the lower qualities, choice samples retaining their quotations more easily. A fair amount of business is passing for England, the qualities shipped being of medium character, buyers paying about 70s. to 75s. The latest report speaks of a general absence of activity.

France.

The first hop fair of this season was held at Dijon, Sept. 20. Comparatively few planters attended, and they were not anxious to sell at the prices offered. With some difficulty a few lots were bought at 100 to 105 francs. The quality of the crop is generally satisfactory, the yield being a little more than half that of last year.

Belgium.

This market seems to have been seriously shaken, judging by the prices recently quoted. The Alst railway authorities cannot understand the small quantities they are called upon to handle. Growers are uneasy, dealers cannot obtain orders from their customers, and a correspondent says that if the brewers continue their present policy of abstention, the small Belgian crop will weigh so heavily on the market that it is impossible to foresee to what low point values will fall.

In Poperinghe business is also very dull, with a marked tendency to lower quotations. Some shipments of Belgian hops have been made to England at very moderate rates, sellers being much disappointed in the results of their negotiations, having expected that the small English crop would have created an active demand with remunerative prices.

The first free hop market of this year, organised by the Comité Agricole d'Assche, was held on September 25, and was well attended by brewers, dealers and growers. These meetings are supported by Government, and are encouraged by prizes offered for the best exhibits. The verdict of the jury who awarded the prizes was to the effect that there is much improvement this year in the picking and curing, but that the cones are light, having failed to recover from the effects of the cold spring and the severe attacks of vermin. Washing has been more generally practised with good results, but the Belgian planters are feeling the competition of Germany.

Transactions in Store Stock.

(Reported to the Department of Agriculture and Technical Instruction for Ireland.)

Bandon Fair (co. Cork) was held on October 3. Average supply of cattle; demand fair at low prices. Calves, 1st class, £3 17s. 6d. to £4 10s.; 2nd class, £3 to £3 5s.; yearlings, 1st class, £4 10s. to £5 10s.; 2nd class, £3 15s. to £4 2s. 6d.; 3rd class, £4 17s. 6d. to £5 5s.; two years' old, 1st class, £10 to £12 5s.; 2nd class, £8 5s. to £9 7s. 6d.; 3rd class, £9 15s. to £7 10s.; three years' old, 2nd class, £12 17s. 6d. to £13. Small sheep fair; demand not so good for lambs as in recent fairs. Lambs, 1st class, £1 11s. to £1 12s. 6d.; 2nd class, £1 1s. to £1 8s. 6d.; over twelve and under twenty-four months' old, 2nd class, £1 15s. to £2 2s.

Ballinasloe Fair, co. Galway, was held on October 3. Average-sized fair composed chiefly of lambs; demand moderate for those in good condition, but slow for all others. Brisk demand for ewe hoggets suitable for breeding, and almost a complete clearance of this class effected. Lambs, 1st class, £1 13s. 6d. to £1 18s.; 2nd class, £1 5s. 6d. to £1 11s.; 3rd class, £1 to £1 3s.; over twelve and under twenty-four months' old, 1st class, £2 9s. 6d. to £2 13s. 6d.; 2nd class, £2 to £2 4s.; two years' old and over, 3rd class, £1 5s. to £1 9s.

Loudonderry Fair was held on October 3. Large supply of cattle; demand slow, and very few changed hands. Yearlings, 1st class, £8 7s. 6d. to £9 15s.; 2nd class, £6 10s. to £7; 3rd class, £3 to £3 10s.; two year-olds, 2nd class, £8 5s. to £9 10s.; 3rd class, £5 15s. to £6 5s.; springers, 1st class, £17 12s. 6d.; 2nd class, £11 to £14 5s. Very few sheep. Lambs, 1st class, £1 16s. to £1 17s.; 2nd class, £1 8s. to £1 11s.; over twelve and under twenty-four months' old, 1st class, £2 15s. to £2 17s. 6d.; 2nd class, £1 17s. 6d. Young pigs, eight to ten weeks' old, averaged about 24s. 6d. each.

Ballinasloe Fair, Galway, was held on October 4. Small supply of cattle, chiefly Kerry's, for which there was a slow demand, and the great proportion of the inferior class failed to find purchasers. Shorthorn cattle of good quality were all sold. Yearlings, 1st class, £7 15s.; two year-olds, 1st class, £10 15s.; 2nd class, £9 15s.; 3rd class, £5 10s. to £6; three year-olds, 3rd class, £6 10s. to £8 5s.

Lincolnshire Farmers' Union.

At the last meeting of the Lincolnshire Farmers' Union the chairman, Mr. Colin Campbell, referred to the recent interview their deputation had had with the Minister of Agriculture on the subject of the meat supply for the Army, and said that his lordship intimated that if the union would send a resolution he was prepared to forward it to the proper quarter. Mr. Campbell now moved a resolution expressing the great disavowal with which the union viewed the proposal to substitute "home-killed" for "home-fed" meat for the Army, and pointing out that as all other requisites for the Army had to be of British manufacture the union asked, as a matter of common justice, that the meat supply should be put on the same footing. The resolution further pointed out that if the system which obtained at Aldershot and other places were extended, namely, the buying of live cattle locally, to be killed by army butchers, it would wholly prevent the fraud which in many instances had been successfully practised to the great detriment of the British farmer, and would confer a great benefit on agriculture in general. The chairman mentioned that at the interview Lord Carrington read a memorandum from the Secretary of State for War, which stated that it was absolutely impossible to tell in many cases which was home-killed and which home fed meat, and that if they wanted to be sure the authorities would have to employ a whole army of detectives.

Mr. Wood said he thought Earl Carrington begged this meat question entirely. He as good as told them that for the past five years they had been paying for home-fed meat which they had not been getting, and that the guarantees which the contractors gave were not worth the paper they were written on. If such were the case why should not the Army kill their own meat? He seconded the resolution. This was unanimously agreed to.

The secretary read a letter from Colonel B. Scott, R.E., on the subject of Army meat, in which the writer suggested that the difficulty of distinguishing the carcasses could be overcome by allowing the feet to be retained on foreign animals, and branding them. Something similar to this was done in India to distinguish the carcasses of sheep from goats.

It was resolved to thank Colonel Scott for his letter, and to send him a copy of the resolution passed at that meeting.

The chairman suggested that as a Bill was to be brought before Parliament for the taxing of motor vehicles they should consider the matter at their next meeting, and see if they could not send up a resolution on the subject. They all knew what an increasing curse motor cars were on the roads, so that it was hardly safe, especially at night, to go on them.

Mr. C. Featherstone said he should not move in the matter unless the money raised by the tax were given them to spend on the roads.

It was agreed to place the matter on the next agenda.

Mr. Bellwood drew attention to the recent order on sheep-dipping which had been made in another county, and said it was probable they would have a similar order made here. He suggested they should consider it a disgrace that they should have sheep scab in this country when Australia could keep clear of it, but the orders ought to be drawn up so as to cause agriculture the minimum of inconvenience.

It was agreed to consider this question at the next meeting, and that in the meantime a copy of the Board of Agriculture Order recently issued should be sent to each member of the union.

Shorthorn Prices in the Argentine.

It is questionable if the Shorthorn boom in the Argentine is not to some extent subsiding. This, at all events, is what is said on the subject by the *River Plate Review*.

"Prices realised for imported pedigree stock this season are causing any amount of uneasiness amongst importers and dealers. We have had some of the best stock offered at various auctions, and rates in every instance fell far below what was anticipated. The fact of the matter is that the business is now overdone, and the supply is far in excess of the demand. Our estancia friends have ridiculed their enthusiasm for high figures, knowing very well that if they do not get supplied at their own price at one sale, there are plenty of others yet to come. The people that will suffer most are the new firms who have come in on the tide, bringing large lots of animals on the supposition that numbers will tell. It must be remembered that Argentine buyers in England have been busy outbidding each other on every possible occasion, so that there is less margin than usual for a drop in prices on this side. Further, a good many of our biggest establishments now buy in England through agents, and hence do not need to be represented at the Buenos Aires auctions."

Work for Wet Days.

AT last the rain has come, and for more than a week past we have nothing but gloomy skies and a downpour of wet more or less continual. Of course, we welcome the change, though with a pang of regret we bade adieu to the Indian summer, and rejoice to see all the springs filling up and a plentiful supply of water. For a long time past a kind of saving up has been going on of jobs that could be done on wet days when outdoor work would be impossible. The moment has arrived for these indoor tasks, and we find farm men busy amongst them. In the West of England it is not an uncommon thing to devote wet days at this time of the year to the grinding of the apples, which are picked up in the orchards daily, for the purpose of cider-making, and mills of both ancient and modern type are now busy at work. But in districts where cider-making is no part of the farm curriculum there are plenty of wet day tasks to be performed. Perhaps all the machines used in harvesting have not been cleaned, oiled, and put away, and if not, here is a job that will repay for the time spent over it. It is a good rule to have at least one overhauling of cowsheds and stables during the year, and they are all the sweeter and cleaner for a coat of good linewash on the walls. Then there are odds and ends in the way of repairs of carts and tools, the making and repairing of hurdles, and so on and so on. In very truth there is no need to stand idle when rain is pelting down and outside work is impossible.

Autumn Ploughing.

A FEW weeks past, when the ground was dust dry and as hard as bricks, farmers were asking in pessimistic tones whether they would be able to get started with the ploughing, but the opportunity has come, as it invariably does, and when weather permits it is a common sight now to see one, two, or more teams in a field breaking up the stubble and exposing the soil to the influence of the weather. A good deal of rain has fallen of late, and though it may not have penetrated the subsoil it has thoroughly moistened the upper crust which the ploughshare turns over in a crumbling, friable condition. What a master hand in agricultural work a good ploughman is! He knows nothing of science and arts or things outside his own little circle, but in his way he is indispensable, and it is a pleasure to see him manipulate his plough and his team, and draw a furrow as straight as if he had used a pencil and ruler. We hear that in the ploughing competitions which take place at this season of the year, that it is mostly men of long experience who carry off the honours, and that there is often difficulty in getting competitors in the classes for youths and young men. This is a pity, for it is

the lads who drive the teams to-day, whom we hope will be the ploughmen in the future.

The Pride of Labour.

THERE are two ways of looking at work. One man does it in order that he may earn money at it to supply him with the necessities of life, and because the conditions of society demand that men shall work to live. (It is surprising all the same how many there are who seem to live without doing much work.) There is something wanting, however, about a man whose only object in working is to earn wages. It is the lack of pride and interest in the work, which, like onion in the stew, gives it flavour, and makes it more palatable. The backbone of Britain to-day are the men who labour not only because they are obliged to do so, but because they have a liking for the tasks they perform and take a pride in doing them well. It will be a bad day for farmers if the day ever comes—let us hope it never will—when there are no shepherds who take as much interest in the flock as if the sheep were their own, stockmen who possess an inborn love for animals, carters whose prime object in life is to turn out a creditable team, labourers who take a pride in laying a hedge or thatching a rick in a way that cannot be improved upon, and ploughmen who can draw a furrow straight and true as a hair. Happily there are plenty of men of the above stamp now, though people say they are not so plentiful as they used to be, and we wonder whether in all cases farmers realise what treasures they possess in such men. The question is an open one.

Training Young Farmers.

NO one is more ready to admit than we are that there is a scientific and theoretical side to agriculture in which the farmers of the future should be educated, and, perhaps, the present generation has lost and is losing something, because this part of their education was neglected at the beginning. What we want to avoid, however, is the sacrifice of the purely practical at the altar of science or theory. The other day we saw a young squire who is wealthy and owns a large estate, guiding a plough and receiving a lesson from a man who can hardly write his own name. We rejoiced in the sight, and were pleased to see a Varsity student guiding a plough. He will not have to earn his living as a ploughman, but if he knows how to do it himself he will know when the work is done properly. Teach the young farmers everything in laboratory and class room that may be useful to them, but do not let them get the impression that it is *difficile* to work. There is not a single operation on a farm that a farmer should not be able to perform

himself, even though there may be no necessity for actually doing it; and do not let us forget that a very essential part of a young agriculturist's education is that which the ordinary farm lad acquires in the daily round of labour.

An Interesting Suggestion.

IT is a common thing when a person is troubled with some injurious insect pest, and seeks advice as to its eradication, to turn away disappointed when an expert suggests such a simple remedy as catching and killing. Yet in many cases this is about the most useful and practical advice that could be given. In a recent issue of the MARK LANE EXPRESS a correspondent drew attention to the losses suffered in certain districts through the caterpillars of the cabbage butterfly, and he suggested as a remedy the destruction of the latter. We can imagine some people smiling at the bare idea of keeping a butterfly but for the purpose of knocking down cabbage moths, but when one realises that the destruction of one female insect means also the death of a number of hungry caterpillars, there is nothing absurd about the idea at all. We ventured to suggest a few weeks ago that some of the NATURE study in village schools might be turned to practical account, and mentioned the collecting of queen wasps as a case in point. Here we have another illustration. In the old days children used to glean and do other little things which brought some grist to the family mill, but now the popular idea seems to be set against any form of wage earning so long as the children are under the care of the schoolmaster. We do not give the force of it; and our view is that the giving of prizes or payment for queen wasps, cabbage butterflies, and other injurious pests would be a practical and useful form of NATURE study.

Mushrooms.

WHILE fields were dried up and brown, mushrooms were not abundant, but rain has pushed the edible fungi into growth and mushrooms are much more plentiful in the markets. The man in the street who buys his mushrooms from the greengrocer is apt to think that the farmer must do fairly well out of them, or is silly if he does not; but, as a matter of fact, except in a few cases, farmers do not make merchandise of the mushrooms that grow on their holdings, though there is no real reason why the fungi should not be treated as a crop. Some years ago we knew a man who dressed his ground so as to encourage the growth of mushrooms and these he picked and sent to market, but the difficulty he had in protecting his crop from the public was extraordinary.

Notice boards were no good, and the trespassers who figured in the local police-court and were fined, were treated as martyrs defending public rights. The unfortunate mushroom grower won for himself an unenviable character and was nicknamed "Fungi," which stuck to him as long as he lived. In many cases it is not mushrooms that cause the trouble, because the pickers like black-berry gatherers are not always so particular as they might be, and have no regard for the farmer's fences or other parts of his property. In these circumstances it is not surprising if the farmer treats mushrooms as an intolerable nuisance.

Pond Mud as Manure. THIS season a number of thoughtful people have taken advantage of dry weather and waterless ponds to get the mud cleaned out of the latter. The advantages are twofold. In the first place the water-hold-

ing capacity of the pond is improved and the water is cleaner and more pure; and secondly, the mud taken from the pond is useful on the land. Some people make a point of carting this alluvial deposit straight on to the ground, but a better course is to treat it properly in the form of a compost heap before doing so. Time should be allowed for some of the moisture to drain away, and to make a good mixture the heap should be turned and lime added. A small proportion of the latter will sweeten and pulverise the compost and destroy any insects that may be lurking therein. Besides having a valuable mechanical effect on the mud the lime will be beneficial on the land when the compost is carted out and spread. Of course, it all means labour with both men and horses, and perhaps this is why many mud heaps are never used, but are left and in time become grassed over, but if properly treated a good compost is worth much more than the time and labour spent in preparing it.

of a man of the sincerity and calibre of Lord Carrington—means the saving of the estimated loss of £150,000 a year. Well, let it be represented as a "bounty" (if the word be not too heretodox and smack too much of the corn law days). Let it be regarded as the annual grant to the great liners is regarded—as a method of safe-guarding an assured home-supply in time of stress? Certainly, we are justified in assuming from the phraseology which he employed that the Minister of Agriculture has already actively interested himself in the hope of persuading the Minister for War to adopt—providing his economical instinct be not offended—what Lord Carrington has himself described as "the status quo ante." If this be so, Lord Carrington himself must be congratulated upon his courage and upon his fidelity to the interest of which he is the executive chief. It is a happy portent of future generosity.

Agricultural Politics.

BY A LOBBYIST.

A Surber of the Radical Strength.

It is perhaps well that we should for a moment review the strength of the Radical anti-peers—should see whether there is any real vitality behind what Balzac calls "the weird discords of their antiphony"—who now promise fire and fury against the Upper House unless it does their behest in pleasure or in pain. Let us not forget the fact that there is likely to be a great change in the character of the electorate. The Plural Voters' Bill, which mathematically restricts every elector to one vote, may not become law at once; but what will become effective almost immediately is the decision of the various revising barristers which has called into existence the persons euphoniously described as "latch-key voters." In London and the suburbs this is alone said to mean the addition of a hundred thousand persons to the electorate. It is no use indulging in illusions. The vast majority of these voters will belong to the class from which Radicalism and Labour draw their recruits. And do not indulge too optimistically in the conviction that the Liberal and Labour quarrel will vitiate this colossal strength. If we are to believe Mr. Winston Churchill, the second ballot hovers on the horizon; and the second ballot would be the death of any adventitious value from Progressive splits. My anxiety is not to invoke spectral fear, not to call hobgoblins from the electoral depths. My anxiety is rather to let you know how it is that men like that stormy petrel of Radicalism, Mr. Lloyd-George, jauntily hails a tussle with the Lords as likely to lead to what he pertly describes as "the tackling of the landlords"—to the prevention (I quote his picturesque language) "of a state of things on the land which means that the sustenance of the labouring man is often sacrificed to the sport of the idle few, that almost as large a share of the produce of the soil goes to pay for the permission to cultivate it as is allotted to maintaining the labourers who till it through the sweat of their brow."

Will Mr. Asquith Penalise the Land?

"Fear came upon me and trembling," quoths the Prophet Job, "which made all my bones to shak. Then a spirit passed before my face; the hair of my flesh stood up: It stood still, but I could not discern the form thereof. An image was before mine eyes; there was silence, and I heard a voice." Heaven forfend, I be deemed to wish to reduce my readers to this condition of dire, appalled, palsied trepidation. It is, however, the wisest providence which seeks to comprehend the resources of your opponent's armory and his intentions. The Land Tenure Bill was originally scoffed at because of what was described as "its innovacity"; it was declared to be a forcible-feeble product likely to be as fertile of good as the Dead Sea fruit is of sweetness. Now, it is distorted into the significance and moment of being the cupola of the ark of the tenure-covenant. All this is to justify a more vindictive and remorseless purpose against the Lords if the Bill be lacerated. I am neither uttering warning nor admonishing; I am only stating what I know. Already, in anticipation of the mutilation of the Bill in the Lords, a movement is on foot to induce Mr. Asquith to

heighten land taxes, say, to the taxation of all kinds of land values, in his next Budget. The chief hope of the situation from the Conservative point of view is, of course, that the assertive Socialist and Labour Parliamentarians will arrogantly and pertinaciously insist on their fads having the first place in the Radical scheme. In that event there will be wigs on the green. This preoccupation would be a blessing in disguise. The phantasists, romanticists, nationalists, and revolutionaries would not then be able to spire a second from their exchange of gory vituperations.

I have purposely in these first two paragraphs outlined the actual and possible Parliamentary and electoral situation, so that we may comprehend with some sense of forethought the rival prospects of the future.

Are the Canals to be Nationalised?

And so gradually the secrets of Pandora's box are being revealed, and so gradually the scheme of Penelope's web is being woven. If Mr. Winston Churchill—and this ebullient young gentleman is too conscious of his own importance to be without some knowledge of the intentions of the Cabinet-hierarchy—is to be believed, we are on the eve of the promulgation of a scheme of canal nationalisation. Whether it will proceed on the lines of the plan of Sir John Brunner and his colleagues I do not, of course, know, for Mr. Churchill is uncharacteristically reticent. Perhaps his friend, Mr. Lloyd-George, the President of the Board of Trade—who plays the part of Damon to Mr. Churchill's Pythias—has not confided more to him. At all events, the agricultural interest will not have cause to complain if the resources of the State are to be utilised—either in conjunction with private capital or independently—in reviving the natural and artificial water-ways of this country, and thus in reviving another competitive means of internal traffic which either the jealousy and cupidity of great railway concerns or the foolish indifference of the community has so long allowed to remain derelict. How many of my readers will hail this as a wiser utilisation of the State's resources than attempting to reproduce the principles of the Irish agrarian economy in England? Most, I opine. The revival of the canal system under the aegis of the nation should be a direct boon to the agrarian population in all its complexions. But we haven't got it yet. Vaunting ambition sometimes o'erleaps itself.

Will Army Meat be Home-Fed?

Have we reason, after all, to indulge in hope? I am, in this interrogation, referring to the attitude of the Government in regard to the supply of home-fed meat to the Army. "If," said Lord Carrington to the Scottish Chambers of Agriculture, "the change can be effected"—that is, the condition that the meat is home-fed be restored to the contracts—"it would be done, but if, in the interest of the public, it could not be done, he would not be a party to any 'hanky-panky' arrangement." "The interest of the public," a somewhat Jesuitical phrase, which one is a little astounded at finding in the mouth

Is the Gomben-Man a Bogie?

Of course, there is much in Lord Lansdowne's contention that the landlord night, in the future, be confessed to be a much more lenient creditor than the gomben man, an undesirable personality who might find in a national system of small holders an unrivalled opportunity for exploitation. The gomben-man has been admittedly one of the most sinister excrescences upon the Irish land system. His avowed help has helped to wreck the purpose alike of Mr. John Bright, Mr. Gladstone, and Mr. George Wyndham, and has sufficed to secure for his own never repleted purse much of the profuse philanthropy of the English exchequer. Cautious, however, the gomben-man has been checkmated? Is he an excrescence inevitable to any British system of small holdings? We have already a illustration in English law that the avicious and vindictive money-lender—the man who wants not merely the pound of flesh for which he contracted in the bond, but half a dozen pounds of flesh with a sufficient quantity of life-blood as juice—can be countered. In this case until the whole of the instalments were paid—yes, even if they were secured by an annuity—the eventual and final property in the land would remain with the State. Mortgage could not, of course, be forbidden—this would mean, indeed, that a bad season might inevitably spell ruin to the most desirable and thrifty of holders; but permission to enter into a mortgage could be so surrounded by conditions as to make an English edition of the pernicious Celtic gomben-man simply impossible. If it be impossible for a democratic Legislature to exact protective conditions in the interest of the holders then the Legislature is a fallow futility. I present these views to Lord Lansdowne, one of the men whose very sagacity England would enlist for the purpose of constructing these safeguards.

More Claim for the Motorist.

Are we to see an active development of the pretensions of the motorist? I ask this question because of the remarkable contention of that enthusiastic motorist, the Hon. A. Stanley, M.P. "The roads," quothed he, "must adapt themselves to the traffic, and not the traffic to the roads." Is this so, forsooth? Is vehicular traffic to be the only consideration, and of a vehicular traffic which, under the existing circumstances, contributes little towards the upkeep of the roads through which it scurries, leaving only an evil smell and a demoralising trail of dust to indicate its recent presence? If this be so, what should prevent the introduction of the ordinary locomotive to the roads? Why should we have a speed limit at all? The Hon. A. Stanley's contention presumes two things: The first is—that an agreeable doctrine for the *non eorum riche*—that the roads are the supreme property of the wealthy, of the people who can readily secure for themselves fiery, snorting cars. The second is that, rich or poor, the pedestrian has no rights. The Hon. A. Stanley and his associates—who, by reason of their extravagance of pretension, are themselves the parent of much of the prevailing embittered sentiment antagonistic to motors—forget that the Legislature has never failed to recognise the right of pedestrians by demanding that no vehicles should run to the danger of the public, and, further, by insisting that where they did run to the danger of the public (as in the case of railways) it should be along a highway constructed and maintained at their own expense.

The Lincolnshire Farmers Union

VICE CHAIRMAN.

MR G.A. BELLWOOD,
VICE-CHAIRMAN.

MR H.W. PALMER,
SECRETARY.

LINCOLNSHIRE FARMERS' UNION.

A Step in the Right Direction.—Its Formation and Progress.—The Future.

BEFORE setting out the object and aim of the Lincolnshire Farmers' Union it will perhaps be well to explain the circumstances that led to its inception. Probably ever since there was such an industry as farming it has been usual when two farmers met together to make the same stale old remark that, though times had been bad with them they were getting rapidly worse, and that of a surety "something" would have to be done. It never seemed to occur to them *what* that "something" should be, or by whom that "something" should be accomplished. In the autumn of 1904 some half-a-dozen farmers were talking together, and precisely the same remark was made again. It, however, occurred to them to consider *what* that "something" must be, and by whom it should be brought about. They thought that the proper and only persons to do it were the farmers themselves; what they thought should be done is set out below.

A meeting was held shortly afterwards at Lincoln, at which the "union" was formed; proposed rules were drafted. The unanimous opinion was that the "union," if taken up by the farmers in their own interest, would supply a very much felt and long-needed want. Almost the whole of the meeting showed their practical sympathy with the movement by subscribing substantially to start the "union" on its way. The first annual general meeting was held in the Corn Exchange, on January 27, 1905. It was largely attended, and it was felt that as the "union" was only in its infancy it was a distinct success through being attended by such an enthusiastic and representative body of farmers from all parts of the county.

It is the express wish of the "union" that it should be most clearly understood that it is not working against any class of persons or any existing institutions; the Chamber of Agriculture for instance; they feel that they are working towards the same end (the benefit of agriculture), and that, therefore, if only on that ground, there should be a common sympathy between them.

Many schemes have at various times been started with the object of bettering the state of agriculture as an industry, but through some incomprehensible lack of common sense, and inability or disinclination to combine, farmers have allowed them all to end in failure. It is thought that now, owing to the very bad times through which the very great majority of them have passed, and are still passing, there is a different feeling amongst them, and that they are at last beginning to see the utter futility of carrying on their calling with any prospect of success without that consideration which all other trades and professions have adopted with such very great advantages to themselves.

Much the most notable of the schemes started in comparatively recent years was the one in which the late Lord Winchelsea was the prime mover. This (the "union") movement differs from it in one most important particular, in that it only accepts the *farmer* as a member. Lord Winchelsea took in the *landlord*, the *tenant*, and the *labourer*. In the opinion of the "union," no scheme could possibly succeed which took in all these three classes, whose aims and objects, to a certain extent, must of necessity differ.

While the members of this "union" recognise to the fullest extent the genuine and cordial relations which exist, and have existed, on many estates between the landlord and his tenants for many generations, and which they most earnestly hope for ever will exist, they recognise that that excellent state of affairs does not obtain on all estates, and in all cases the tenant and the labourer has to eye with them. Although the interest of the master and his man are in the main identical—their getting a living out of the soil—it is not for many reasons thought feasible to take the labourer as a member into the "union."

Happily, in this country at any rate, a good feeling exists between the man and his master, and there is every reason to hope that on both sides the same happy relations may continue, for on the other hand whilst the master cannot do without labour—and the better and more willing it is, the better—for the other hand the labourer good labour he cannot get a living, and so is unable to give employment and make his men comfortable. The men recognise that in this they have identical interests. It may not here be out of place to state that in some statistics got out by Mr. Fox for the Board of Trade (February 17, 1905), that while the average wage of the agricultural labourer over the whole of England is 16s. 9d., the average for Lincolnshire is 18s. 8d. This shows an increase of 4 per cent. since the year 1895.

It may be stated without any possible fear of contradiction that the first and by far the most

important object of the "union" is to bring about combination among farmers. Given combination, there is nothing which the agricultural industry will not be able to accomplish, and it should be borne in mind that it is by far the most important industry in this country, and that it has more capital embarked in it than any other trade, and that more persons of all classes are dependent on it than any other. Without combination its condition must of necessity drift from bad to worse, and it must finally become bankrupt. This would not only spell ruin to those engaged in it, but it would also be a great national disaster.

Almost every profession, trade, or industry has its own peculiar trade organisation. In consequence when any particular trade is in need of help from Parliament for the betterment of its condition it is able, through being organised, to speak to its Parliamentary representative with no uncertain voice, and tell him what to do, not to do as farmers have done from time immemorial, do nothing, or at most tell the member, if ever they happen to see him, that in their own private opinion "something" *might* be done. This condition of things does not give the member a chance to do anything, even supposing he was able and willing to do it if he could, for he does not even know what the majority of his agricultural constituents really require.

Legal Aid.

Cases frequently occur which affect farmers as such; many of these are of great interest and importance to them as a body. In the opinion of the "union," cases of this class, after due and proper investigation by the committee, should be undertaken either wholly or in part, by one of the members behalf and the whole or part of the costs defrayed by it as should be agreed.

At present many actions are brought against individuals, which should it have been known beforehand, that in all probability the "union" would fight it, never would have been brought, or over heard of. This is a matter of great importance, for with the "union" at his back it would inspire the member with a confidence which at present he lacks.

Taxation.

That the burden of taxation falls at present levied, more heavily and more unjustly on agriculture than any other industry, is, unhappily, only too well known to all of us. The land we farm to us represents, what to any other trade is its raw material, out of which we manufacture our finished product in the shape of corn, meat, &c. In no other instance is raw material taxed. In our case it is, and heavily.

The "union" is thoroughly of opinion that the bulk of the present taxes should come from the Imperial exchequer. In many county parishes the Education Act and its attendant rates has proved itself anything but the benefit it was asserted to be. It is also of opinion that the least the Government could do would be to make the Agricultural Rates *Act permanent*, and not of a temporary character as it is at present. The sum assessed for local taxation is £160,000,000. The sum assessed for income tax is £500,000,000. This shows that for the purpose of local taxation only one-third of the wealth of the country has to bear the burden of these taxes.

Railway Rates.

One of the greatest curses from which agriculture suffers is the form of extortion extracted from it in the shape of "railway rates." These rates are not laid on the basis of what the carrying capacity is, but on the basis of what the railway company think "the traffic will carry." They pile the rate on as much as they possibly dare. They only stop when they see an immediate likelihood of killing that particular industry altogether.

Take the potato trade in the Spalding district as an example. Goods are carried from India or America to inland towns for the same price as in England they are carried for 100 or 200 miles. The companies say that if we co-operate and sent truck loads, instead of small consignments, they would treat us better; but we should continue to be extorted as at present, so that our own herds, which are at present healthy, may not be exposed to the risk of that awful scourge, pleuro-pneumonia. Should

Exclusion of Canadian Store Cattle.

A renewal of the agitation is now being attempted to induce the Government to allow the importation of Canadian store cattle for feeding purposes. It is to the interest of the agricultural community, or at any rate of what the greater portion of it, that they should continue to be excluded as at present, so that our own herds, which are at present healthy, may not be exposed to the risk of that awful scourge, pleuro-pneumonia. Should

their entrance be permitted, small farmers who annually rear a few stores for sale would be by far the greatest sufferers.

Foreign Meat.

For many years much has been written about the marketing of foreign meat. It is a well-recognised fact that foreign meat is a vital necessity to the well-being of the nation. Producers of English meat have, as a measure of the barest justice, a right to demand either the marking of it, or the licensing of the vendors. The public could still please itself which sort it bought, but it would then know, that if it paid the English price, it would get the English meat. It is a most curious fact that though tons of foreign meat are daily supplied into the various towns, it is never possible to buy any, except at one or two insignificant shops in that town, which could not be by any stretch of imagination sell the quantity which comes. The mystery is, what becomes of it?

Pure Beer Bill.

A wide-spread opinion prevails that at a future date the now defunct "Pure Beer Bill" should be reintroduced. All that is wanted is that "beer" should be made of barley-malt, hops, and sugar. Other decoctions can still be made of any ingredients preferred, provided that they are not called beer, and other ingredients declared. It is worthy of remembrance that when this Bill was before Parliament many county members, for some unexplained reasons, were the friends of "the trade" first and their constituents afterwards. This seems to point out the very patent moral that what "the trade" accomplished in Parliament on that occasion in its own interests, could have been quite as easily accomplished had there been at that time an agricultural party to look after its interests.

Boundary Fences.

The law as it at present stands is defective as to boundary fences. It should be made compulsory for the occupier to keep his boundary fences and water courses in a proper state of repair and scoured out.

Agricultural Research.

Both in America and on the Continent a much larger sum of money is allocated by the Government for agricultural education and research and experimental farms than is done here. In the budget for the current year the U.S.A. has allocated to these matters the sum of £1,255,000; France, £1,750,000; England, £119,337. Much valuable information is so derived which is of the greatest benefit, but on account of its cost it would have been impossible to obtain by the individual farmer.

Sheep Worrying.

A Bill is greatly needed giving compensation to the owners of sheep worried by stray and other dogs, and sanctioning their summary destruction. The dog licenses should be more rigidly enforced, and more discrimination exercised in the giving of exemptions. It is a notorious fact that scores of useless curs are now exempted whose owners have neither sheep nor cattle to tend.

Objects and Aims.

To briefly summarise the foregoing the objects and aims of the Lincolnshire Farmers' Union are:—

LOCALLY.

- (1) One of the principal objects of the Union is to give legal and other aid to its members in all suitable cases.
- (2) Co-operation with a view to a reduction in premiums for Fire, Employers' Liability, and other insurance.
- (3) The Union intends to organise the co-operation of its members for the sale and purchase of Agricultural produce and necessities.

PARLIAMENTARILY.

It is the intention of the members of the Lincolnshire Farmers' Union to vote for no Parliamentary candidate unless he unreservedly pledges himself, if returned to Parliament, to support to the utmost the whole of the following programme:—

- (1) That the Agricultural Rating Act be continued until the whole system of rating is dealt with on the basis of agricultural land being treated as raw material.
- (2) That the whole cost of Education, under the Education Act shall be borne by the Imperial Exchequer.
- (3) That the Maintenance of all Public Roads shall be paid out of the Imperial Exchequer.
- (4) That Preferential Railway rates for Foreign Produce shall be abolished.
- (5) That all Vendors of Foreign Meat shall be Registered, prominent notices to that effect shall be displayed in their shops, and all Foreign Meat shall be sold as such.
- (6) That the beverage called "Beer" shall be made wholly and solely from Barley-Malt and Hops.
- (7) That the Regulations now existing respecting the Slaughter of all Foreign and Colonial Cattle, Sheep, and Swine at the port of entry, be continued.
- (8) That a Bill is needed ensuring the Futility of

Butter, its freedom from Moisture, and embodying better regulations for Testing Milk.

(9) That a Bill is urgently needed to enforce the better control of Stray Dogs, and to make the granting of exemptions for so-called Sheep Dogs more stringent.

(10) That a Bill is needed allowing the Production of spirit for Motive Power without the present excise duties.

(11) That a Bill is urgently needed for the Better Control of Motors on the Highways, to secure the bodily safety of the public.

(12) That a Bill is needed to provide more Funds from the Imperial Exchequer for Agricultural Research.

The above were submitted to all candidates in Lincolnshire, Nottinghamshire, and Rutland at the General Election.

The Union has supported the Fertilizers and Feeding Stuffs Bill, the Dogs' Bill, Beer Bill, and Land Tenure Bill, though taking exception to Clause 6, and will in future continue to watch the progress of Bills relating to Agriculture before Parliament.

Officers of the Union.

CHAIRMAN.

Colin Campbell, Stapleford, Newark.

VICE-CHAIRMAN.

E. W. Howard, Ingley Hall, Saxilby, Lincoln.
G. A. Bellwood, J.P., Bishop's Norton, Kirton Lindsey.

CENTRAL COMMITTEE.

G. Bartholomew, Thorpe-on-the-Hill, Lincoln.
J. D. Blanshard, Bardney, Lincoln.
J. Brocklebank, Carlton-le-Moorland, Newark.
W. E. Brocklebank, Carlton-le-Moorland, Newark.
W. T. Brown, Haddington, Lincoln.
W. B. Burt, Wellingore, Lincoln.
C. Clarke, Scopwick, Lincoln.
J. H. Copping, Timberland, Lincoln.
H. W. Coppingham, Broxholme, Lincoln.
A. W. Dean, J.P., Dowshy Hall, Bourne.
O. Featherstone, Necton, Lincoln.
W. S. Fox, Potter Hanworth, Lincoln.
J. T. Glew, Springthorpe, Gainsboro'.
F. Godson, Temple Bruer, Lincoln.
G. E. Hides, Thorpe Tilney, Lincoln.
R. A. Holmes, Skellingthorpe, Lincoln.
J. C. Mountain, Wellbourn, Lincoln.
G. Powell, Temple Grange, Navenby, Lincoln.
H. Rawding, Eagle, Lincoln.

BRANCHES.

Stamford.—J. Thurlby, Baston, Market Deeping, chairman; J. Turner, Little Bytham, Grant-ham, hon. sec.
Bourne.—C. E. Andrew, Austerby, Bourne; H. Goodyear, Austerby, Bourne.
Wragby.—C. H. Turner, J.P., Pantton Hall; H. Mawer.
Blyton and Corringham.—H. J. Robinson, Dun-stall, Gainsboro'; H. T. Sleight, Pilham, Gainsboro'.
Newark.—A. Stretton, Sibthorpe; H. Hopkinson, Minskham.
Market Rasen.—J. Birkitt, Thornton; J. H. Nettleship.
Retford.—W. W. Cranfield, Morton, Retford; J. C. Smalley, Belmoor.
Sleaford.—S. E. Dean, Threekingham Manor, Folkingham; George Widdowson, Swaton, Folkingham.
Boston.—J. Bowser, Frithville; E. Crawford, Wyberton.
Grimsby.—George Marriss, Kirmington, Brock-lesby; Captain G. P. Jennings, Binbrook, Market Rasen.
Grantham.—J. Willingham Fowler, Grantham; W. B. Mason, Somerby.
Brigg.—C. Wood, J.P., Wootton Dales, Uckoby; Duncan J. Dodds, Elsham, Lincoln.
Horncastle.—W. Taylor Sharpe, J.P., Baumber; W. S. arby, Horncastle.
Kirton Lindsey.—F. F. Nicholson, Willoughton Manor, Lincoln; W. Everett, Kirton Lindsey.
Donington.—T. Harrison, Donington; S. Hansard, Bicker, Boston.
Secretary, H. W. PALMER,
C. and C. Bank Chambers, Lincoln.

Rules of the Union.

1. The union is formed for the purpose of watch-ing over and defending matters affecting farmers, and to take such action as may be thought desir-able for their welfare. All party politics and all sectarian matters, except those bearing on agri-culture, shall be avoided.

2. The entrance subscription to be at the rate of 3d. per acre on land valued, maximum subscrip-tion 43s. No one to be eligible as a member unless he is carrying on the business of a farmer in actual practice, and farming not less than ten acres of land. The minimum subscription to be one shilling.

The annual subscription, after the first year, to be as follows:—10 to 50 acres, 1s.; 50 to 100 acres, 2s.; 2s. per 100 acres or portion thereof up to 1,000 acres; over 1,000 acres, 6d. per 100 for the excess.

No member to be entitled to vote who is in arrears with his subscription.

Honorary members accepted at a minimum sub-

scription of 1s., and allowed to attend meetings and join in discussions, and not allowed to vote.

3. The business of the union to be managed by a central committee of twenty members, with power to add to their number, six of whom shall form a quorum; in case of a tie, the chairman to have the casting vote. The central committee being elected at the annual general meeting, and to be eligible for re-election provided they have attended at least three-fourths of the meetings during the year.

4. The annual general meeting to take place in January each year, in Lincoln.

5. That a special general meeting may be called at any time by the committee, who shall direct the secretary to convene such meeting by giving not less than seven days' notice to each member of the union.

6. A member may be expelled by a majority of three-fourths of those present at any general meet-ing of the members.

7. That a majority of the members present is required to pass any vote or resolution, the chair-man to have the usual casting vote.

That no rule shall be altered or withdrawn, except at a general meeting.

That all rules of the union shall be entered in the minute book and signed by the chairman.

8. That the union shall not enter into any legal proceedings for the benefit of a member unless ordered to be taken by a two-thirds majority of a meeting of the central committee, specially con-vened, consisting of not less than twelve members.

9. That any member wishing to bring any sub-ject before a general meeting of the union, must give notice to the secretary in writing, fourteen days before such meeting.

10. That all expenses of the union shall be paid by the central committee out of the funds of the union; all accounts to be passed by the central committee before being paid.

All cheques to be signed by two of the follow-ing:—The chairman, the hon. treasurer, and one member of the central committee, and counter-signed by the secretary.

11. The accounts of the union to be made up to December 31 each year, and a balance sheet sub-mitted at the annual general meeting.

12. The duties of the secretary shall be to convene and attend all meetings of the union and of the committee, to take and record minutes of all business transacted, to prepare reports, collect the funds of the union, and pay them to the treasurer's account, and generally to carry out any directions which he may receive from the chair-man or committee.

13. That no member can withdraw from the union without giving six months' notice in writing to the secretary, expiring any December 31.

14. That the union be registered.

Formation of Branches: Proposed Rules.

1. A branch may be formed in any district with the consent of the central committee, subject to the rules and regulations of the union.

2. Each branch shall elect annually a chairman, hon. secretary, and local committee, who shall attend to all matters affecting the interests of the members of that district, and report to the central committee. The hon. secretary to give notice of meetings, conduct the correspondence, keep min-utes, and assist in collecting subscriptions.

3. No independent action shall be taken by any branch without the consent of the central com-mittee.

4. The chairman and hon. secretary shall be ex-officio members of the central committee, and each branch may appoint one other member of central committee for every fifty in excess of the first fifty members.

5. No expenses shall be allowed, except such as appertain to meetings (including postage and stationery), and particulars of all such expenses must be sent to the secretary of the union to be dealt with according to Rule 10.

6. The annual branch meeting to take place in November or December of each year.

7. Members shall elect to which branch they will belong. All members of the union are free to attend branch meetings, but only members of the particular branch to vote.

8. The secretary of the union to send a special list of members entitled to vote at each branch to the hon. secretary thereof.

Annual Report.

The last annual report of the union will give an idea of the good work which this body has already accomplished, and demonstrate the energy and thoroughness with which it is worked. The secretary (Mr. H. W. Palmer) said—

"In presenting my first annual report, reference must be made to the balance-sheet, which works out on the right side, in spite of the fact that many subscriptions are not collected, owing to the impos-sibility of one man doing all the collection.

"Several branches are now getting into working order, and by this means the collection will be greatly facilitated.

"Early in April our pamphlet was published, together with a large number of cards, setting forth the objects and aims of the union.

"Next we turned our attention to meetings in market towns and villages, the first being held on May 1 in Boston, since then meetings have been held at Saxilby, Harby Navenby, Metter-ingham, Causton, Sleaford, Horncastle, Grimsby, Corringham (twice), Branston, Kuskington, Wel-ton, and Spilsby—these before harvest; since harvest, Billingborough, South Kyne, Blyton, Bas-singham, Bourne, Grantham, Spaulding, Eagle, Wragby, Retford, Newark, Stamford, Timber-land, Swinderby, Market Rasen, &c., and branches have been formed at Stamford, Wragby, Newark, Horncastle, Corringham, Bourne, Gran-tham, Retford, Market Rasen, Boston, and Grimsby, although in several of these they are not fully established. The Press has readily assisted the movement, special thanks being due to the whole of the local papers, the *Yorkshire Post*, *Nottingham Guardian*, *Nottingham Express*, and *Sheffield Telegraph*. In addition, the *London Daily Mail* has given us a special article, and the *Agricultural Supplement of the London Standard* has promised in the future, as in the past, to further our interests. The *Cheddar Chronicle*, and other distant papers have published our programme *in extenso*, and our pamphlet has travelled as far afield as New Zealand.

"At the Darlington Convention, October 21, the union was represented by the chairman, Mr. Geo. Powell, and the secretary; and the chairman re-ceived a very hearty reception when speaking on the Pure Beer Bill.

"The Board of Agriculture invited us to attend the Hull Show, where they had a pavilion, and the secretary there met three members of the Board, besides representatives from the Derbyshire Dairy Co. and the Holderness Agricultural Club.

"As a mutual protection society much good has been done, though only one case has gone before the court, and this is still *sub judice*.

"However, one member obtained compensation, £8 10s., by means of the union's name; another received £5, when he had only been offered £1; and the union forced an insurance company to pay a claim in full, where they had only offered half."

"Further members have been threatened with judicial actions, but on the union undertaking their defence no more was heard of it.

"A list of twelve questions has been submitted to all candidates in Lincolnshire, Notts, and Rut-land, and undoubtedly the strong position taken up by the union over the election will bear good fruit in the future.

"Early in December the union joined with the Lincolnshire Chamber of Agriculture and the Lincoln Chamber of Commerce in sending a deputation to Germany to study the question on sugar beet. Three out of the four delegates were members of the union. The report will shortly be published.

"Branch rules are now submitted to the meet-ing for confirmation, and I cannot help claiming that if new branches take up the movement with as great a zeal and enthusiasm as some of those already established, considerable strength will accrue to the union, and next year's report will show a membership of thousands where to-day we have hundreds.

The Future.

The foregoing are a few of the things which, in the opinion of the "union," would substantially reduce the depression of agriculture if they were carried into law. This list by no means exhausts the measures which might be taken up with advantage, but merely gives a few instances of those measures which should be pressed on candi-dates in agricultural constituencies. Self-preser-vation is the dominant instinct of the human race. The "union" most earnestly urges every farmer in the county to exercise to the full that instinct. With organisation all things are possible for him, and a brighter future assured. Without it, nothing that is of advantage to him can be by any remote possibility secured.

As sure as day follows night, so sure is it that without that organisation which the "union" so earnestly advocates, the condition of farmers in-dividually, and agriculture in this country as a whole, must rapidly go from bad to worse, and that through their own culpable neglect the greatest, the oldest, and the most necessary of our national industries will be allowed to be extinguished.

The "Mark Lane Express" and the Lincolnshire Farmers' Union.

We have pleasure in announcing that in future all official reports and communications of the Lin-colnshire Farmers' Union will appear regularly and promptly in the columns of the MARK LANE EXPRESS.

The farmers of Cornwall are suffering from the damage and mischief caused to their crops by wild pigeons, and it has been suggested at a meeting of the County Farmers' Union that a combined onslaught should be made on the birds on two or three fixed days, with a view to reducing their numbers.

Midland Notes.

THE rush of harvest work being past, the agricultural discussion season is upon us, and among other bodies our country farmers' associations are reassembling. Many members of the Staffordshire Association will be glad to hear of the proposal for meeting in future a little earlier in the year. In this case milk and milk contracts are the chief things to be considered, and an earlier meeting might often help to stiffen the backs of members with Michaelmas contracts to make. It is interesting to note that at the Staffordshire meeting the enterprising county secretary (Mr. E. Smithells) was urgent in advising adoption of the factory system.

WHICH, by the way, is a reminder that one has heard nothing more of late of the scheme for starting a farmers' co-operative dairy factory at Bagworth in Leicestershire. That seemed to promise success when the provisional committee was framed. Let us hope, therefore, that "No news is good news."

THE Nottingham Association, I understand, is also thinking of a mutual assistance scheme on the lines of the Eastern Counties Agricultural Co-operative Association, one of whose experts made a great impression on the farmers of the county to whom he lectured last winter. But the county association sadly needs more members. A balance of under a sovereign in hand at the end of an economical year means that the officials have not much to work with.

THERE is a chance, it seems—probably a very strong one—of interesting developments in connection with the Midland Agricultural and Dairy Institute at Kingston, Derby. When the Leeds University authorities thought of starting an agricultural college at Kingston, the college at Kingston was approached without effect, and it is understood that Birmingham University has also made overtures of the same nature. But it has already been recommended by Mr. Brook-Hunt, his Majesty's inspector, that students at Kingston ought to be able to take a degree on leaving, and now that Nottingham is also thinking of establishing an university of its own, the college would probably please all its friends and supporters by joining hands with the new institution.

AT present, I hear, nothing definite has been decided upon. But greatly as the Kingston College has flourished under Principal Blackshaw, it would probably take still higher rank as part of a great modern university, and it need hardly be pointed out to Nottingham people how much their proposed university would gain by the inclusion of so well managed and completely equipped a faculty of agriculture. At present the college is run by the county councils of Notts, Derby, Leicester, and the Lindsey division of Lincs, and the value of the experimental and research work which it conducts on farms in the four counties is well recognised by practical men.

TURNING to the other side of the county, our hop-growing friends will be sorry to hear of Lord Cobham advocating withdrawal of a useful privilege which the Worcester County Council now allows them. Up to the present time hops have been stored at the Shire Hall at periods when the regular market accommodation has been overtaken without any harm being done to anyone; and apparently there is no very pressing fear of the walls of the building being overstrained by their excessive weight. It is a point, of course, which has to be considered; but one trusts that the Standing Joint Committee will not withdraw the present facilities without stronger evidence of danger than has been suggested yet.

THE Board of Agriculture circulates a notice to the effect that black scab is showing itself among the potatoes of North Wales. By all accounts this is identical with the "yellow wart disease," the presence of which in Warwick and Worcester was noted in this column as far back as the middle of August, and possibly earlier. There seems to be no room for doubt that this fungoid disease is spreading, and that its presence will make it more than ever necessary this season for growers to be very careful indeed when their seeds come on. Like all fungus pests, the "yellow wart disease" is more easily picked up than got rid of.

MAY I be allowed in self-defence to make a small correction? In this column last week I am made to speak of farmers waging war on the deep-rooted couch grass by the old process of hand-picking. It should be, of course, hand-forking. Doubtless my handwriting is to blame; hastily written the two words might be mistaken one for another.

October 11, 1906.

DAIRY.

The Preservation of Milk Samples.

Since in the case of composite testing samples of milk are collected together in one bottle and have usually to be kept for some time before a test is made, one of two courses must be followed:—Either the milk must be allowed to sour and be tested in that state, or a preservative can be added in order to prevent it from becoming sour.

The latter is, on the whole, the preferable method, and since the period of preservation is often ten days or a fortnight the preservative must be of a powerful nature; and, further, since the sample is merely to be used for testing purposes, the poisonous character of the preservative used will be no objection beyond the merely general one of the desirability of keeping poisons out of all connection with food substances.

The substances which are most frequently used for the above purposes can be roughly divided into four classes, according to their character:—

(1) Those which are true germicides, whose purpose is to at once actually destroy all germs with which they come into contact. In actual use there are really only three substances of this class: Chlorine gas, bromine (a liquid), and corrosive sublimate.

(2) Antiseptics proper, which are often used in diluted form, and then only check the development of bacteria without entirely destroying them. This can be effected by using them in a strong or pure form. To this class belong carbolic acid or phenol, creosote and thymol, a fragrant, white, non-poisonous body largely used in surgery.

(3) Deodorants, as their name implies, have as their specific use the doing away with the smell which often accompanies decomposition. This is often affected by substances containing a large proportion of oxygen, and of this class permanganate of potash is the most frequently met with.

(4) Preservatives proper whose properties are similar usually to those of antiseptics, but milder and less poisonous. They may thus be used in foods in small quantities, or if sufficiently diluted. Of this class there is a considerable number, and they are very widely used. Some are salicylic acid, formalin, benzoic acid, boracic acid, borax.

It is open to question as to how far these substances which are so frequently added to food are injurious to the human system. It is unquestioned, however, that when absorbed into the system in large quantities their presence is undoubtedly injurious, and more especially so when consumed by young persons and those whose digestions are delicate. Of the two methods followed when composite samples are necessary, the use of preservatives has the advantage over the allowing the sample to become sour. The sour sample can, of course, be utilised by neutralising the acidity by means of an alkali—caustic soda or ammonia; but in practice the presence of this added alkali gives rise to a possibility of error in making the test which is greater than that possible if the milk has been preserved instead of allowed to become sour.

The most convenient form of preservative is that of pellets, and these are now easily obtainable. Those of corrosive sublimate, one of the strongest and most poisonous of preservatives, are very soluble, and as a precaution they contain a brilliant coloring matter which is imparted to the milk in such unmistakable fashion that the possibility of mistaking it for good milk is reduced to a minimum. They are further obtainable in three strengths, which are useful according to the time the sample is to be kept.

Another very serviceable preservative is bichromate of potash. This has also the advantage of a distinctive colour—a brilliant yellow—and hence the possibility of mistaken use of the milk containing it is rendered practically impossible.

American chemists even use chloroform occasionally to preserve samples, and it is found to be successful, though its use in England is not common.

In using these preservatives care should be taken that when fresh milk is added to the sample bottle containing the preserved milk the new should be thoroughly incorporated with the old, so that the effect of the preservative may be uniform throughout the whole of the milk. Special care is needed, however, in mixing them to avoid churning the milk in any way.

L.L. ANDALE.

National Diploma in Dairying, 1906.

The eleventh annual examination for the National Diploma in the Science and Practice of Dairying was held by the National Agricultural Examination Board at the Midland Agricultural and Dairy College, Kingston, Derby, for English students from the 24th to the 28th ult., and at the Dairy School for Scotland, Kilmarnock, for Scottish students from the 1st to the 5th inst. Fifty-five candidates entered for the examination: Thirty-two at the English Centre and twenty-three at the Scottish Centre.

As the result of the examination the following thirty-three candidates succeeded in satisfying the examiners and have thus become entitled to receive the National Diploma in Dairying:—*English Centre*.—Walter Biffen, George Rumsey Bland, Mrs. Anne M. E. Bowmer, Charles Robert Dewey, Miss Maude Elizabeth Dobson, Robert Fenton, George E. H. Ferry, Miss Gertrude Freeman, Harold Gathorne, John Miller Lonsdale, Miss Hilda France Newbigin, Miss Edith Noble, Miss Alice Hannah Pimlott, Wilfrid Sadler, Robert William Stanforth, William Sugden, Miss Frances Mary Taylor, Miss Tannie Wood, Victor Lionel Yates. *Scottish Centre*.—Miss Edith Anderson, John Anderson, John Cochran, Miss Catherine M. Dallas, Miss Margaret Turnbull, Douglas, John Dunlop, Miss Mary Finlayson, Miss Lilias Lees, Thomas Limond, James Mackintosh, Miss Grace Robertson, Wilfrid George Sandeman, John Hunter Smith, Miss Lily Strang.

Nantwich Cheese Fair.

Pitch about 45 tons. Sharp sale, all cleared in forty minutes. Prices:—Best, 70s. to 75s.; medium, 64s. to 68s.; lower grades, down to 60s.

Agricultural Imports.

The following account shows the quantities of certain kinds of agricultural produce imported into the United Kingdom in the week which ended Saturday, October 6. The quantities in the corresponding week of last year are given in parentheses:—

ANIMALS (living).—Oxen, bulls, cows, and calves, 11,307 (12,372); sheep and lambs, 4,927 (5,039); horses, 186 (332).

FRESH MEAT (cwt.).—Beef, 91,434 (113,876); mutton, 79,108 (71,283); pork, 9,740 (11,724).

SALTED OR PRESERVED MEAT (cwt.).—Bacon, 74,816 (106,732); beef, 1,493 (3,518); hams, 11,192 (17,949); pork, 2,242 (3,445); meat, salted or fresh, 10,787 (14,592); meat, preserved, 10,712 (5,614).

DAIRY PRODUCE (cwt.).—Butter, 73,438 (85,071); margarine, 16,376 (22,739); cheese, 64,237 (66,706); milk, fresh (31); milk, cream, 60 (64); milk, condensed, 16,860 (20,457); milk, preserved, 47 (290).

EGGS (Great hundreds).—258,000 (399,638); poultry (value), 2,108 (1,813); game (value), 2,242 (3,325); rabbits, dead (not tinned) (cwt.), 15,259 (34,561); laid (cwt.), 25,482 (44,870).

CORN, GRAIN, MEAL AND FLOUR (cwt.).—Wheat, 918,200 (1,368,100); wheat meal and flour, 307,100 (346,700); barley, 551,000 (588,800); oats, 160,400 (184,200); peas, 81,039 (84,660); beans, 16,700 (38,240); maize or Indian corn, 1,027,000 (692,700).

FRUITS, RAW (cwt.).—Apples, 120,721 (85,461); apricots and peaches, 71 (—).

HAY (tons).—1,980 (2,739); straw (tons), 2,153 (1,076); moss litter (tons), 1,305 (1,392); hops (cwt.), 2,607 (4,071); locust beans (cwt.), 7,518 (48,920).

VEGETABLES (RAW).—Onions (bushel), 190,363 (210,091); potatoes (cwt.), 23,780 (22,863); tomatoes (cwt.), 10,355 (12,339).

The Cultivation of Tobacco in England.

A correspondent who recently inquired of the Board of Agriculture whether the Government would encourage the home farmers to carry out experiments in tobacco growing, in view of the success attending such experiments begun on Lord Walsingham's home farm twenty years ago, received the following reply:—

"Sir,—I am directed by the Board of Agriculture and Fisheries to advert to your letter of 17th ult., and to say that the cultivation of tobacco in this country is prohibited for revenue purposes; but that in 1886 and 1890 experiments were conducted in many parts of England, by permission of her Majesty's Treasury, for the purpose of ascertaining whether marketable tobacco could be grown. In a few cases the experiment was apparently successful, but in by far the greater number it was a complete failure, and inasmuch as reports of expert advisers went to show that the plant could never be cultivated in this country to compete successfully with tobacco grown in warmer climates, the permission was withdrawn, and has not since been renewed.—I am, sir, your obedient servant, T. H. ELLIOTT, Secretary."

Cheaper Mutton?—At a meeting of the Colonial Consignment and Delivery Distributing Company held on Tuesday, Sir E. M. Nelson said that sheep were increasing both in Australia and New Zealand, and the result would probably be that next year there would be larger shipments and probably very cheap mutton in this country, which meant that the price would have to go down both in Australia and New Zealand. The colonial farmers did not like to recognise that, or at any rate, they were not anxious that the price should go down too soon; but he thought probably they would find it inevitable.

EARL CARRINGTON AT THE SCOTTISH AGRICULTURAL CONFERENCE.

The annual conference of the Scottish Chamber of Agriculture and Associated District Societies with the President of the Board of Agriculture took place on Wednesday in Edinburgh and was very largely attended. Mr. John A. Dewar, M.P., honorary president of the Chamber, presided, and was supported by several other Scottish members of Parliament, whilst, as mentioned by Mr. Isaac Connell (the secretary), there were represented in the conference not only the Chamber of Agriculture, but fifty-five affiliated societies from every county in the country, aggregating a membership of about 1200, the percentage of farmers being ninety-five and the remainder landed proprietors and factors.

The President of the Board of Agriculture (Earl Carrington) was accompanied by Sir Thomas Elliot, Permanent Secretary to the Board of Agriculture, and Mr. L. C. Flood, private secretary to Sir Thomas.

The Land Tenure Bill.

Several subjects were down for debate, and Earl Carrington closed each discussion with some comments. The first resolution dealt with the Land Tenure Bill, and after some speeches Lord Carrington said he understood that the position was that Scotland practically approved of the Land Tenure Bill, but that the Chamber thought there ought to be a Scottish Bill, and that Mr. Munro Ferguson's Scottish Bill would better meet their views. One of the great objections advanced was to the compensation for disturbance clause. Now, he understood that the general tenure in Scotland was under nineteen years' lease. Well, under that arrangement Scotch farmers had a certain amount of security for their holdings. But farmers in England held their farms on yearly, and in some instances on half-yearly tenancies. The claim of compensation for disturbance as amended in the Bill of the Government would not be any nebulous claim. It was a monstrous hard thing that a man whose family had spent 600 years on the land should wake up some morning to find that he was given twelve months' notice to quit. To turn out that man without compensation, or with only meagre compensation, for his improvements was a hardship, a cruelty, and a shame. In the different parts of Great Britain farmers lived under different conditions, and he would implore them not to set their faces, because they were in good heart, against a proposal to compensate people for disturbance. After all, the proposal was only to compensate them for the cost of removal. Because they did not approve of the Bill, let them not have it knocked out of the Bill altogether. Then he understood there was another objection. The meeting practically approved of the proposal that Mr. Munro Ferguson's Bill should be applied to Scotland. Well, he did not think it would be difficult to adapt the Government Bill to Scotland. Mr. Ferguson's Bill provided, and in the opinion of the Chamber it was generally considered that the landlord ought to pay a lump sum of money as compensation to the outgoing tenant. The proposal was that the landlord should pay that, and that that should not be put on the incoming tenant to cripple him. That was very good in theory, but if they came to think of it, after all, that money went to the benefit of the incoming tenant. Now, they must be just to the landlords. It was said the landlord could get an increased rent. But what was to prevent a landlord saying, "All right, the compensation is £500 and the rent £500; therefore the first year's rent is £1,000 and the next year's £500." Then, as to having a Scotch and an English Bill. There was a great deal of opposition to the Bill, and altogether his lordship supposed that at the present moment he was about the most unpopular man in the South. Was it wise, was it a tactical measure in the circumstances, to divide their forces and to have two Bills?

The Chamber, notwithstanding this speech, passed a motion declaring that the Land Tenure Bill, as amended by the Committee on Trade, contained provisions which it is not expedient to extend to Scotland, and welcoming the introduction of a separate measure applicable to Scotland alone.

Selling Foreign Meat as English.

A resolution was next adopted demanding "That his Majesty's Government should take such steps—legislative or otherwise—as shall effectively protect the British producer and consumer against the fraud of foreign meat being sold as British, and that the sale of boneless meat should be entirely prohibited."

Lord Carrington said it was impossible for the board to take proceedings unless they obtained the co-operation of agriculturists. It was true that tuberculous animals could be imported into this country, and that was very bad, but it was a

matter for the Board of Trade. It would be a strong measure to prevent the importation of any particular kind of food, and would only be justified by very great danger to the public health, but he would give every consideration to the matter, and do his best. (Cheers.)

Army Meat Contracts.

A resolution was next passed by a large majority that the War Secretary be requested to take the first opportunity of restoring to the Army contracts the condition that meat supplied for the Army must be home fed. Earl Carrington said that he held very strong opinions about the matter. If the mutton and the beef supplied to the British Army was to be home fed it would necessitate an increase of £150,000 a year on the Army Estimates. He asked could it be done? Did they think the British public would stand an increase on the Army Estimates of £150,000? As a Government they would do all they could for agriculture, but he absolutely refused to be a party to any legislation which would hoodwink or throw dust in the eyes of the public for agriculturists. As their representative in the Government, he would put the whole thing fairly and squarely before his Majesty's Ministers, and if it could be done it would; but if, in the interests of the great majority of the public, such a thing as this could be done, then he absolutely dissociated himself from any sort of hanky-panky.

Blended Butter.

In reply to a resolution urging the Government to introduce legislation to give effect as soon as practicable to the recommendations of the Select Committee of the House of Commons on this subject, except recommendation 15, which the conference did not approve of, Lord Carrington said the only objection seemed to be to the committee's recommendation with regard to blended butter. That was a very difficult question, and it would undoubtedly be a strong measure to prohibit the sale of an article which was not injurious, which was cheap, and for which there was a public demand. They would do their best to pass at the earliest possible opportunity a Bill which, he hoped, would be satisfactory not only to British but to colonial producers.

The Milk Standard.

This was the next subject, and concerning it the following resolution was agreed to:—"That the Board of Agriculture's regulations regarding the milk standard have not proved satisfactory in operation; and further, that the law should be amended to the effect of enabling the successful defender in a milk prosecution in Scotland to recover expenses, as is presently competent in England."

Lord Carrington, in reply, said he thought this was a state of things which ought to be remedied at the earliest possible opportunity. The matter was one that did not concern him, but the Scotch Minister. He did not know whether the Scotch Office would bring in a measure of the kind next year, but, if he might suggest it, their president should sound his Scotch colleagues, and bring forward a Bill, to which, he thought he was justified in saying, the Government would put no opposition in the way.

Small Holdings.

After a discussion on the subject of the Small Holdings (Scotland) Bill, which everybody professed anxiety to promote, though diversity of opinion was shown in the question whether land purchase should accompany their formation, a resolution was carried by a large majority favouring small holdings where a demand for them exists, but expressing the opinion that fuller opinion should have been obtained on this subject before legislation was introduced.

Lord Carrington said the Bill was a Government Bill, and therefore he was in favour of it. He did not say it was a perfect Bill, but it was an honest endeavour to deal with an ancient difficulty of most formidable proportions. He congratulated them on the discussion that he had just heard. It had been very temperately argued, very earnestly argued by men who knew what they were talking about, and who had very strong convictions on the subject. He need hardly say that all those arguments would be most carefully considered by the Government, and he congratulated himself on having had an opportunity of listening to a discussion of so much interest, and which, he hoped, would be profitable not merely to themselves, but to the country and the Government as well.

Access to Mountains.

A resolution having been passed against the Access to Mountains Bill now before Parliament, Earl Carrington said he would bring the resolution before Mr. Bryce, the author of the Bill. He did not know what the law was in Scotland, but in

England a tenant could not prosecute a trespasser unless he proved damage. Trespassers were there also a horrid nuisance. They went all over the place after mushrooms, and did a certain amount of damage, but he thought all this showed the necessity for different regulations in different countries. If the general opinion of Scotland was against this Bill, he did not think any Government would be idiotic enough to run its head against a stone wall.

The Motor Speed Limit.

Finally the question of the speed of motors was discussed, and the following resolution was unanimously adopted:—"While expressing satisfaction that the Motor Car Commission have approved of the principle that motorists should contribute towards the upkeep of the highways, this conference very strongly disapproves of the Commission's recommendation to dispense with the present speed limit, and adheres to former resolutions against the compulsory lighting of all slow-going vehicles."

Lord Carrington said with regard to a speed limit he was not prepared to give an opinion. In France there was no actual speed limit on the highways, but the local authorities were enabled to regulate the speed through their own localities, and he believed they came down as low as five miles an hour. Any breach of those laws was very severely punished. He should bring what he had heard before his right hon. friend the Secretary for Scotland, who would take counsel with his friends and give the most careful attention to all their opinions.

Votes of thanks to Lord Carrington and Mr. Dewar terminated the conference.

Every Labourer his own Master.

Earl Carrington subsequently attended the annual dinner of the Chamber and Associated Societies, and, in replying to the toast of the Board of Agriculture, said the House of Commons had spent more time on agricultural questions this session than in the whole of the last six years put together. No industry could be in a sound condition which did not offer opportunity and encouragement to the small man to improve his position. He looked forward to the day when every agricultural labourer might have a chance of becoming his own master. The policy of the Government was one neither of confiscation nor spoliation. In placing new men on old acres they had no intention of displacing or injuring the present race of tenant farmers, who had fought a gallant fight against the repression of the last thirty years. He bespoke the help of the Scottish Chamber to carry into operation the Prime Minister's aspiration that the land might become less the pleasure ground of the rich and more the treasure house of the nation.

AGRICULTURAL LAW.

Advice of a Legal character is offered to Readers entirely free of charge. Particulars of cases should be addressed to the Editor, "MARK LANE EXPRESS," 3, Wellington Street, Strand, London, W.C.

Tenant's Fixtures.

SIR,—In your issue of the 6th inst., "Barrister-at-Law" in replying to a query, states that, "if the timber is driven into the soil and the building or erection is fastened thereto, the whole is a fixture and cannot be removed, &c."

I would, however, remind "Barrister-at-Law" that Section 34 of the Agricultural Holdings (England) Acts, 1883 to 1900, enacts that after the commencement of the Act, 1883, the tenant, subject to certain conditions, may remove any fixture or building before or within a reasonable time after the termination of the tenancy.

It is assumed the querist is the occupier of an agricultural holding to which this Act applies.—Yours faithfully, LAND AGENT.

October 9, 1906.

(There was nothing in our correspondent's letter to show me that he was a tenant of an agricultural holding within the meaning of the Agricultural Holdings Act; on the contrary, the inference was that he was not. I presume that by Section 3, Section 34 of the Act of 1883 is meant, and Section 4 of the Act of 1900. The erection, alteration, or enlargement of a building is an improvement to which the consent of the landlord is required. I am obliged to my correspondent; I was aware of these sections, but they are not of universal, and of only special application.—BARRISTER-AT-LAW.)

His Majesty the King annually presents two 20-ounce cups for best root crops in the Royal South Bucks and the Royal East Berks Agricultural Associations. This year the Bucks cup has been won by Messrs. Kinross and Lindsay, of Datchet, and the Berks cup by Messrs. Cotterell, Bros., of Ruscombe, and in both cases the winning crops were the produce of Messrs. Sutton's seeds exclusively.

Northern Notes.

ACTIVITY is the watchword on the farm just now. In Northumbria this week we passed fields where belated patches of corn remained ungathered; and travelling as we had done a hundred miles from the Humber, the sight of cereals still uncared seemed extraordinary, and as if something were amiss with the farm economy in the north. Even in Yorkshire haycocks were to be seen standing like gaunt sentinels in the otherwise bare fields, with in the distance a copse or a bit of wooded wold, where the autumn tints showed up magnificently under the early morning sun, as it dispersed the mists and cast shadows over the stubbles.

NICE rains have fallen, and nights as well as days have been warm, so that vegetation has prospered under the beneficent influences of a mild autumn. More rains would be welcomed for the roots on dry situations, which catch much sunshine; but it is simply marvellous what great progress bulbous crops have made during the last three weeks from the Tyne to the Humber. A large cultivator says he expected about half a crop of turnips; now his fears are dispelled, and there will be, he says, an ample growth for all his needs.

CATTLE and sheep are doing remarkably well, and the mildness of the atmosphere is prolonging the period when stock may be allowed to keep the pastures prior to the winter housing. Grass lands have the last ten days assumed an aspect almost, one might say, of luxuriousness, and in strong contrast to their midsummer appearance. In the stock markets the beef trade is anything but cheering. There are not many good "beefy" cattle on the markets yet, but the prospect is not a good one for prices.

MUTTON has gone down several points in Yorkshire markets, and fat sheep are making shillings per head less than a fortnight previously. Lambs continue to be the great feature of the cattle markets in the same county, and at an East Riding Mart about 4,000 were penned on Wednesday, and farmers tumbled over one another's heads in their eagerness to buy the best. Good long-wool lambs at 42s. to 44s. per head ought to realise something in the spring to bring a profitable return. If they realise the same price plus the wool most of the purchasers would probably be satisfied. Dealers are said to be making heaps of money out of these transactions, but it should not

be forgotten that railway charges are a serious item, and a lot of money may be easily dropped if the sheep have to be moved once or twice.

NORTHERN agricultural ranks are all the poorer for the loss of one who has been a prominent figure for at least thirty-five or thirty-six years. We refer to Mr. G. W. Clark, of Great Driffield, who was without doubt one of the best-informed and practical farmers in the east of Yorkshire. Mr. Clark had farmed for fifty-two years, and it is said he paid in person 104 half-year's rents at the audits of the Dent family, of Ribston Hall, Wetherby. He established and carried on with great success the firm of G. W. Clark and Sons, stock auctioneers, and the late Earl of Londesborough entrusted him with the disposal of his stud of Hackneys some years ago. The deceased had a great capacity for retaining facts, figures, and dates connected with farm and stock, and as a valuer his services were in great demand. He leaves a widow and two sons.

I WAS speaking to a Yorkshire farmer the other day, whose land lay in the track of the devastating hailstorm which occurred locally just upon harvest, when the cereal crops were at their ripening stage, and were ruthlessly cut down, and the grain scattered to the extent in several cases of over 90 per cent. The farmer referred to had a field of fifty acres sown with oats. To some the sequel may seem to be an idle story. He had calculated upon a yield of eight quarters per acre, and it had actually been valued at seven quarters, so that the prospective produce would have been equal to 350 quarters at least. The game was not worth the candle, but out of curiosity more than for any other reason, he decided to put the crop through the machine, and pray with what result? When every available corn was measured, it bulked to 23 quarters. Other fields suffered similar damage, not quite so destructive; the top of roots were flattened as if a roller had gone over them. No such storm had visited the farm or the district previously for at least a hundred years—at any rate, there is no record to be found, and the "oldest inhabitant" has no recollection of one, nor any story handed down from his forebears.

THE potato harvest is in full swing. Already, a northern report says, crops have been entirely lifted in early localities, and upon the whole reports are favourable. On dry soils crops will, there are good grounds for believing, be fairly free from disease. In keeping the malady at bay, the drought of September was of real ser-

vice. The autumn has been exceptionally favourable to tubers. When the weather is dry for lifting, sorting is more easy, and thus the risk of loss from disease in the pit is diminished. In one district we passed through this week, a number of boys were observed digging up the tubers with their hands—a truly primitive method. One was glad to see that mangolds had in numerous instances been secured ere the advent of frost.

October 12, 1906.

PUBLICATIONS RECEIVED.

The Welsh Mountain sheep have at last got a "Flock Book," and the first volume gives promise of a long life for this, the latest of flock books, as it contains the entries of over 150 rams in addition to some ewes. This number, all things considered, is very good for a beginning, and no doubt it will be increased as the book gets better known. Illustrations of well-known prize winners of the breed are given, as well as a description of some well-known flocks, and altogether the Flock book is a credit to the compilers. Application for copies should be made to Mr. J. Marshall Dugdale, Llwyn, Llanfyllin, S.O. Mont.

Messrs. Crosby, Lockwood, and Son, 7, Stationers' Hall Court, Ludgate Hill, E.C., have just issued "Practical Farming in Relation to Soils, Manures, and Crops," by Mr. E. T. Shepherd. The primary object of the work is to provide an inexpensive, but at the same time concise and reliable, handbook for land agency candidates preparing for the examinations of the Surveyors' Institution, and this object it certainly fulfils, but we think it will also be appreciated by other than land agency candidates, for it contains much useful information. It is published at 4s. 6d. net.

In "Inexpensive Rural Cottages and Buildings for Small Holdings" (the *Land Agents' Record*, Ltd., 149, Strand, W.C., 12s. 6d.), Mr. S. Taylor, F.S.I., gives plans and estimated costs, with explanatory chapters thereon, of cottages and buildings for small holdings, which, whilst inexpensive to erect and maintain, are adapted to meet the requirements of a large proportion of the country, and particularly desirable in the interests of rural workers. This volume should certainly aid in the erection of better houses for agricultural labourers, and is therefore welcome.

The offices of the Royal Agricultural Society of England are now at 16, Bedford Square, London, W.C.

JERSEY HEIFER, POST OBIT.

At the Dairy Show last week Post Obit won the First Prize in the Class for Jersey Heifers, not exceeding three years old, bred in Great Britain or Ireland; the Blythwood Challenge Bowl for the best Jersey Cow or Heifer, in milk, bred in Great Britain or Ireland; and also the Third Prize in the English Jersey Cattle Society's Butter Test. She is 2 years 5 weeks old, is by Gay Boy out of Post Stamp 6th, and was bred by her present owner, Mr. J. H. Smith-Barry, Stovell Park, Pewsey, Wilts.

CROSS-BRED DAIRY COWS, MAUD AND MIRIEL 2nd.

The two cows shown above are the cross-breds with which Mr. Dunbar Kelly, Coombe Farm, Kingston-on-Thames, won First and Second Prizes at the Dairy Show last week. Mriel 2nd also won First Prize in the Milking Trials and Second Prize in the Butter Test, whilst Maud was highly commended in the Milking Trials.

THE DAIRY SHOW.

The general display of cattle at the thirty-first annual exhibition of the British Dairy Farmers' Association is on a more extensive scale than for several years past, yet decidedly smaller than in the early years of the society's existence, when the restrictions imposed upon the exhibits were less stringent. In quality there is practically with all the breeds represented a greater tendency each succeeding year to ignore breed character altogether, and to exhibit only such animals as are likely to acquit themselves successfully at the pail or the churn, however unsightly they may be in the way of symmetry, or however far they may fall short of being fairly good representatives of their breed. The judges, however, in making the inspection awards kept in mind the breeding of the animals, and in one or two cases this was especially the case, whilst with one or two breeds the judge had apparently been fixing his awards so that they might as much as possible agree with the performances of the animals at the pail or the churn. This latter theory of awarding the inspection honours is entirely wrong and contrary to the intention of giving prizes for the best animals of each respective breed by inspection, these prizes being intended as a check upon the neglect of breed character that so frequently occurs through the enthusiasm attending the catering for winning a milk or butter-test prize. Both systems, or a combination of characteristic flesh points with a capacity for milk and butter production must be maintained, or we shall quickly go to the wall with our dairy breeds. Once lose the breed points of any animals and it is but a question of time ere you lose the results that the breeding of those points secure to you.

Shorthorns.

The catalogue commences with this good old breed, the pedigree class of cows taking precedence. There was a good entry of these, numbering twelve, and they were, upon the whole, more of a dual purpose character, and less of the usual excessive flesh about them; and also, generally speaking, there was more shapeliness and less coarseness at the udders. Mr. George Taylor secured first prize with one of the old Barington family, a nice cow, and with good udder; both the other prizes were awarded to entries from Lord Rothschild's herd Red Rose 3rd and Broadbush 3rd, the latter cow taking second, both these were neat, well-bred cows, and their bags of good shape too, and their condition quite the happy medium. Of the non-pedigree cows, Mr. Dunbar Kelly had the best in Damsell 2nd (which sounds very like a pedigree) of unknown breeding, a cow with good symmetry and quality as well as milk vessels. The second and third cows, shown by Mr. Nelson and Mr. Raingill, were both of very good dual-purpose character, the second prize one being evidently a great milker. Several other good cows were exhibited in this class. Shorthorn heifers seldom give a

good account of themselves at Islington, and the present year is no exception to its predecessors, Lord Rothschild in pedigree and Mr. John Wilson in non-pedigree stock taking the lead. Mr. John Evans had also some magnificent milking Lincoln Reds, one of which carried off second prize.

There were only five bulls of this breed catalogued, and but one prize awarded; this was given to Lord Rothschild's Rocket, a roan with good symmetry and coat as well as quality.

The milking prizes of this breed were awarded to (in the pedigree class)—first, Mr. Taylor's Barrington Duchess 31st, that was first by inspection; second to the same exhibitor's Melody C; and third to Mr. C. E. W. Adeane's Priceless Princess. In the non-pedigree class Mr. J. B. Nelson's Red Rose, which was second by inspection, carried off first prize, and also the Barham Challenge Cup for giving the greatest number of points; second prize for milking went to Mr. Sheppy's Model Lily, he in the inspection class; and third for milk to Mr. Dunbar Kelly's Damsell 2nd, which was first by inspection. Of the heifers Lord Rothschild's Lady Vivian obtained the first milking prize.

Shorthorns competing in the butter test were all eligible, the prizes being open to any animal in the four classes. Mr. J. B. Nelson's Red Rose also won first prize in this competition, quite a record. She is about six-and-a-half years old, had been fifty days in milk, and yielded 64.12 lb. milk in the twenty-four hours which produced 2 lb. 7½ oz. of butter, giving a ratio of 26.06 lb. of milk to 1 lb. of butter. This is a very satisfactory record in every way. The second butter prize was won by Mr. F. Stanhope's he and important cow Dairy-maid, a six-year-old that had been in milk sixty-two days, and yielded 48.10 lb. of milk, from which 2 lb. 3 oz. butter was produced, which gives a ratio of 22.22 lb. milk to 1 lb. of butter; being richer than many of the Channel Island cattle.

Jerseys.

There was a very good display of this breed as is invariably the case, the Jersey being especially adapted for winter dairying, the cow class was well filled, and the judge gave a very decided preference throughout for those animals that were most typical representatives of their breed, Captain Gisborne's Unaware was the first prize winner, a very representative Island Jersey in shape, quality, and udder, and well shown. Mr. J. H. Smith Barry had also a beautiful cow placed second, Lady May, a grey and white of very good shape and rich colour, with also a capital udder. Earl Cadogan's third was also very fine in quality and breeding, as well as milk appearance. English bred heifers were a very good class. Mr. J. H. Smith Barry obtaining both first and third prizes with heifers showing good symmetry, and especially fine milk vessels with quality. Between there was placed Boronia, a very good heifer of Dr. Corner's, bred

by Mr. Freeman Thomas. The Island bred class of heifers was not of quite average quality. In deed, there were a number of rather inferior animals in them. The best, however, were of a robust character for Island stock, and, with a good show for the dairy, these were shown by Mr. Oswald Mosley, Mr. John Pal'ot, and Messrs. Fowler, De La Perelle, & Co. Bulls of this breed, owing to the restrictive conditions, were few in number. Capt. Gisborne and Mr. Miller Hallett had the prizewinners, and it is satisfactory to state that these bulls had been winners in open competition during the summer.

In the milking trials of this breed, Earl Cadogan's Reindeer's Bessie, third by inspection, carried off the first honour, Dr. Herbert Watney's Blackberry second, and Mr. W. M. Cazalet's Miss Bessie third. The butter test of this breed did not come out, on the whole, either very impressive or very satisfactory beyond the results of the prize-winners, only two other animals being awarded certificates of merit. The butter-test prizes were won by Dr. Watney's Guenon's White Thorn, first with 38 lb. 2 oz. milk in twenty-four hours, from which 2 lb. 5½ oz. of butter were made, giving a ratio of 15.15 to one of butter. Blackberry, from the same herd, carried off the second prize with 29.10 lb. milk in the twenty-four hours, from which 2 lb. 2 oz. of butter was weighed, which gives the remarkable ratio of 1 lb. butter to 13.94 of milk. The first prize cow had been in milk 137 days, and the latter 141 days. Third butter test prize was won by Mr. J. H. Smith-Barry's Post Obit, first by inspection in the heifer class (English bred), which at two years and five months old yielded 34 lb. milk in twenty days, which yielded 1 lb. 13½ oz. of butter, giving a ratio of 18.79 to a pound of butter. This heifer had been in milk 177 days, so that her record was a most satisfactory one.

Guernseys.

This breed was very poorly represented from a numerical point of view, only some eight or nine animals being present. The quality, however, and milk properties were fairly satisfactory. Mr. E. A. Hambro's Queen of the Roses was first in the cow class, and Mr. H. M. Ozanne's Lady Roberts second; these animals had not a separate butter test competition, but were competing against all other bred. Lady Roberts, with eleven summers to her credit, was reserve, after being 2 in milk 178 days yielded 33.11 lb. of milk, which produced 1.54 lb. butter, giving a ratio of 25 lb. milk to 1 lb. of butter. Three heifers were shown, but only a second prize was awarded, this to Mr. E. A. Hambro's Hayes Olive 2nd.

Red Polls.

This breed made decidedly the best display they have ever given of themselves at the Agricultural Hall, and were certainly the third best breed shown.

In the inspection class Lord Rothschild was first

MILKING TESTS.

CLASS AND ANIMAL	Actual Weight of Fat in lbs.		Actual Weight of Solids, not Fat, in lbs.		Points.	Awards.

and second with the very milk-like cows, Jenny Jones and Ethel 3rd, whilst the Earl of Radnor carried off the third honour with Donna. These three cows were aged respectively thirteen years, nine years, and ten years of age, so that their constitutions must be exceptionally good to have withstood the strain of milking and breeding all these years. The two former cows were bred by Mr. T. Fulcher and Mr. Garrett Taylor, and the latter by Mr. J. A. Wallington. There were no less than thirteen entries of heifers, mostly of a very milk-looking class. Lord Rothschild's first, Sir Walter Corbet's second, and Mr. A. J. Smith's third were each of them good heifers for general purposes.

Ayrshires.

This class has been so unsatisfactorily repre-

sented at the Dairy Show for a number of years past that it is quite a question if it would not be better struck out of the catalogue, and a class for Lincoln Red Shorthorns, we venture to suggest, would be an excellent substitute. Only four or five Ayrshires were shown, and these were not exactly typical of their breed as present day type is concerned. The first cow, however, is no doubt a very heavy milker, this was shown by Mr. Nisbet. No other prize was awarded.

South Devons.

For the first time this breed were allotted a class to themselves, and five very fine cows in size and dairy properties came forward. In symmetry they are capable of considerable improvement, but the fact that one of them was reserved for the Barham

Cup being recorded the second highest number of points, proves how good they were at the pail. Mr. W. P. Vosper and Mr. Thos. Cundy were the exhibitors and divided the prizes.

Kerries.

There was a very nice class of cows of this breed. The Duchess of Newcastle and the Countess De la Warr being chief exhibitors, and dividing the spoils. The cows showed a great deal of quality and good milk results.

Dexters.

These were well represented so far as quality is concerned, but in numbers they ran very short, and one or two of the best of them were unable to do their best in the way of milk yield. The Duchess of Devonshire and Mr. Martin J. Sutton held the best animals which were well shown, and received honours in the order named.

CHEESE.

It was scarcely to be anticipated, with the present short make of cheese and the huge demand for it, that entries would be booming, but the decline was very small indeed. The Dairy Show is now come to be regarded as the final trial of strength between English and Scotch Cheddars, and by reason of this the Council ought to be exceedingly careful in the selection of their judge not to offend the susceptibilities of either section. If a judge is drawn from Scotland and another from the West of England, then the fight is on its merits with the umpire to decide, but when one district is ignored, as it was this year, there is ground for the origination of an acrimonious feeling, such as undoubtedly pervaded the Cheddar section of the Hall on this occasion, and which nearly went so far as to cause a general understanding amongst West of England makers to either break membership or else refrain from exhibiting. Certainly it was hard lines to have a Scotch judge and a North London man as colleagues and both tending towards a make of cheese which is deemed best in the fertile districts of the west of England. At the Frome show this year the excellence of the make was generally commented on, and by a full body of expert judges, six of them. Mr. Theodore Cundy was awarded the championship of the show with what has been considered to be the best lot of cheese exhibited there for many years past. Imagine the surprise manifested when it was found that he was awarded only a commended card, and nearly all the rivals he had vanquished at Frome were placed before him. It was, as a Zummerzet maker termed it, a "stunner." The pitch in the class for fours were about as usual in numbers, and they looked a very even lot. The first prize went to a peculiarly dark cutting cheese sent by Mr. Daniel Hood, Kirkcubright; the second was an exceptionally choice Scotch Cheddar, firm cutting, yet rich and beautifully clean. Mr. Robert Stevenson evidently sent of his best. Mr. James McAdam, Castle Douglas, was third with a nice typical Scotch Cheddar, not quite showing so much quality on the iron as Southern makes. Mr. James Smith's was a grocer's cheese. All these awards went to Scotland. Then came Mr. Frank Portch for fifth place with a nice, clean, sound Somerset Cheddar. Reserve went to Mr. Walter W. Keel. Messrs. Cary and Portch were v.h.c., as was also Mr. Joseph Cane, and Mr. W. C. Spencer, who has hitherto been exceedingly successful this year, and brought down to the same level was Mr. J. W. Banwell, the second prize taken at Frome, and then in the rear, very much in the rear, was the champion at Frome. The Cheddar truckle class was very representative, and little, indeed, could be said about Mr. Alexander Cross's first prize lot or Mr. Robert Stevenson's Scotch exhibits, which latter took third, they were even, firm, clean, and full of quality, as was also Mr. Joseph Cundy's Somerset lot, which was sandwiched between the Scotch. The West of England truckles were rather new, but very clean. The Stilton class was, indeed, fine, it was rather riper than usual, and the majority of the exhibits were beautifully moulded, Mr. J. C. Wilford's first prize was very rich, rather close in the skin, but the quality was all that could be desired.

Wensleydales were not a large class, and some of the exhibits were insufficiently ripened, the first prize lots of Mrs. Maria Willis were very nice but they lacked the all-necessary mould for epicure palates. The finest class of cheese in the show so far as quality went was that for the Cheshires; the entries were not over large, but the class was attractive, although one or two of the exhibits were obviously very new. Mr. Frank Heath sent a fine one, with rich, crumbly, finely-flavoured curd, and he had to lose no points to get there so close were the other competitors on him.

This year an innovation was introduced in the form of Lancashire cheese, hitherto a practically unknown commender at the show. The Lancastrians meant to push this make which consists of a rather loose-cutting flaky white cheese. Mr. Chris Collinson was the winner. A county expert was near this cheese ready and willing to give all information in connection with it. The entry and

quality were certainly encouraging enough to make this class a feature of the show. The Double Gloster, which last year produced one of the finest exhibits in the show, this year was somewhat on the down grade, the entries being small, though all were noticed by the judge. The thin Gloster class was a great deal worse, as here the entries totalled two only. In the last class, Mr. Charles Harris was first, in this one the table turned in Mr. George Proust's favour, and so it was practically a case of honours divided.

The Leicesters were represented by two school makes, and that from the Warwickshire County Council Dairy Schools.

The Caerphilly class was not quite so large as in previous years, but they were much more true to type, the curd cleaner and shorter, and less Cheddary, the prize winner most fittingly was a Welsh lady, Miss Annie Thomas, whose cheese cut nicely short, and porous, though it was rather singular that such a well-known Cheddar maker as Mr. Henry Cannon, Somerset, should come in second. The cream cheese class was more than disappointing, several of the exhibitors thinking that soured drained cream in lumps with a repugnant flavour constituted prize cream cheese; there were only about a couple of toothsome lots in this dainty class, others being edible, and some so even this. Despite the attempts made to foster the Continental makes, they do not flourish; thus there were only five entries in the Gervais class, but some of these were very representative of the make.

The unripened soft cheese class filled rather better, the curd evidently having been very cleanly handled. There were various makes shown. It was well perhaps that there was not quite such a large entry in the ripened class, and that it was shown under glass, else another series of an odiferous character would have been added to that of the hams and the goats in the butter section of the hall. There were only four entries of ripe, whilst there were nine in the unripened class. The average consumer would have thought that there might have been the same number in each.

The cheese fair is a most important section of the show, but it was not quite as full as usual, as most farmers could sell all their make at home. There was a good trade for what was sent however.

A careful analysis of the awards will show that the same judges varied their decisions of the same maker's cheese in the fairs class. Mr. Head was put second, the fourth prize taken by Mr. James Smith was now advanced to first, and so on, right through the fair, the general result being most mystifying to everyone else but the judges. The Stilton Cheese Fair was rather small here, the awards went to confirm those already awarded in the Stilton class. It is to be hoped that another year the judging will be sufficiently advanced, so that the awards in the Cheddar classes can be made known before the close of the show.

The collections of dairy produce have very much dwindled of late, there being but one entry, that of Mrs. Aylmer and Burt, Yeovil, which was well worthy of the gold medal bestowed on it. The collection of dairy produce made by students at the British Dairy Institute, Reading, was interesting and educational.

THE BUTTER.

A great improvement as regards space and light has been made by bringing the butter down from the upstairs room and now displaying it all together in the large and well-lighted St. Mary's Hall. But it can be by no means deemed an up-to-date arrangement of what should be the head dairy society in the world to stage butter in close proximity to such savouries as smoked and dried hams and goats. The butter and honey might be allowable, but the other certainly should not. Experts from dairy countries like Australia and New Zealand were rather astonished, and Irishmen declared such could only be seen in England, with some sixty goats forming a square of the fresh butter table; if it had been for the salted it would not have been so bad as this, at least would be preserved or cured, whereas with the fresh it could scarcely be endured. The somewhat peculiar system of lumping prizes somewhat mitigates the attempts of fine differentiation by the judges, but it is rather an anomaly to find one rancid, one superb, and one rather weak flavoured butter all posing as first in the same class; but this was to be found in the hall. After a very minute inspection of every exhibit we could not but note that the butters were more prepared to meet the eye rather than the palate of the judges. But with such a vast amount of technical education at hand, we were scarcely well content to note the insipids or the other extreme of rankness that was so palpably apparent. Some of the butters, though of excellent flavour, were ignored by reason of their texture. What is evidently wanted is for a business and a theoretical judge to be bracketed. It was observable on the judging day that some of these were engaged in conversation with other than the stewards whilst they were supposed to be carrying out their arduous duties. It would be well

another year if the public could be roped back, and thus prevent a harmless proceeding which, however, is likely to be construed into a subject of comment. The staging of the butter was all that could be desired, and effective measures were taken to prevent the public from inserting their stabbers into it. In the class for butter made from Channel Island breeds and their crosses, no salt to be used, many of the butters were insipid, unless heat had been used both as preservative and a flavourer. The prize went to far-off Carlisle for a beautiful flavoured butter, made up in Cumberland fashion, but rather too much polished on the outside and rendered nearly oily. The next first went away down into that county of the apple and cream—fair Devonian—to one of the members of what has been termed the Devonshire Trinity—the Mesdames Bere, Mildon, and Ward—as at whatever show these three appear whatever prize is missed by one is sure to be scooped by the others. But their handle was not quite so long this time, and a number of prizes went outside their scooping. However, Mrs. Ward was first in this class with a very typical butter made from real cream. The other first went to Miss M. K. Harris from the sister county of Dorset. Miss Harris has stood beneath that palm bower and turned the churn in sweet rhythm to the band above, but now she prefers to make good

creamy, and unloudedly the best she sent to the show. The thirds were most widely distributed, going to Mrs. Emily Lewis, Dungeness, near Kidwelly, South Wales, who is producing a fine butter that should obtain greater recognition later. Mr. James Goolerham (Dorset) and Mr. Roland Underwood (Berks) were also in the running. There was another rattling big class for butter with the addition of salt, this did not quite accustom the flavour as it did in the Jersey classes, and here the judge evidently wavered for the weaker butters. Mrs. Lewis was advanced, her butter being very creamy. Miss Helen Monteith, Stirlingshire, was another with butter that had more of sourishness about it; whilst Mr. William Rennie, from the same county, evidently placed his reliance on salt, and plenty of it, and his confidence was not betrayed. The seconds here were again an exceptionally fine lot, Mrs. George Adlam's, Mrs. Bere's, and particularly the exhibit of the Cotswold Sanatorium, Stroud. Some of the other butters here were very porous.

The first of the fights with the Emerald Isle was with the advance guard of the Irish in the class for 2 lb. lumps, slightly salted, to be delivered four days before the show. The mild cured was too much for the sea-borne attack, and gallant little Wales checked it by Mrs. Lewis taking first;

THE CHEESE SECTION.

butter at home, though in this instance it would have been better had she put a little more stiffening in it. The seconds found Mrs. Mildon in company with Mrs. Franklin, Bucks, and the Earl of Plymouth, Redditch, and there was very little distinction between them. But there was variation enough among the thirds, which went to Cheshire, Scotland, and Somerset respectively. Mrs. Ward came out with a commendable card only. Several of the other butters here were gone off.

In the next class remarkable differentiation was made by the presence of salt, and particularly as to whether the coarser or finer salts were used. It is certainly hard lines to produce a perfect butter and then spoil its chances by using coarse salt. Here the Earl of Mount-Edgumbe was first with a rich, creamy, very bright-hued butter. Mrs. Mildon's was quite as rich but rather firmer, whilst as regards flavour and appearance that sent by Miss E. Dickson Parks, Loudwater, can only be adequately described as being lovely. In the seconds Mrs. Robinson's had very fine texture. Miss Harris's was good, but the moisture from salt had still further weakened it; whilst Mrs. Adlam's, though of excellent flavour, was not so well made, the rolling being a wee bit faulty. It was certain that the Carlisle lady would have been higher than third had she not quite put so much Cumberland finish on hers. The Devonian flavour of another butter was not quite so much appreciated, though Mrs. Bere's, from the same county, was very nice in appearance. The butters in this class were, as a rule, better than in the previous one.

In the next two classes for butter made from Shorthorns and their crosses, the first was to be free from salt, and here came long runs of unmentioned that included some that would certainly have been mentioned by other judges. The prizes went to a very firm, close-textured butter sent by Miss Mildon. Miss Harris's was another with a very sweet butter, the other going to Miss G. Hoskins, whose butter had a too distinct ripeness for some palates, and she was decidedly lucky to get placed above the seconds, Mrs. Irving (Cumberland), Mrs. Adlam (Somerset), and Mrs. Bere (Devon); the latter's exhibit was lovely,

Somerset, through Mrs. Adlam, backed her up as second, whilst support was afforded by Mrs. Bere's, third, from Devonshire; Mrs. Ward coming to the help of her countrywoman as reserve. There was variety indeed in this class, but not so much gone off as in some of the other perfectly fresh exhibits. The class of the show, undoubtedly, not so much as regards size as of quality, was that for butter made from scalded cream slightly salted. Mrs. Bere was first with a very rich Devonshire creamy butter, rather dark in appearance. Mrs. Adlam's, second, was much cleaner in this respect, and of lovely texture. Lady Rothschild was third with a lovely coloured butter, and admirably worked, whilst Lord Rothschild's reserve lot was equally meritorious. Then came the Irish butters in non-returnable boxes, and, of course, the conditions in several instances were not complied with. The packages were to be non-returnable, and the rolls not to be separately wrapped. One exhibitor carefully subdivided, and each roll wrapped, above all things, in cotton wool. The first prize went to the Drumholm Society, whose butter, however, had run together, but it was far ahead of some of the others.

It was very evident in a number of these Irish butters that a starter had been used. In the class for slightly salted butter, wrapping to be allowed, in some instances this was of a much too expensive character, and in others unsuitable; particularly in the large boxes the quality of the paper was at fault, as a large amount of adherence took place. It was also most noticeable the number of boxes that arrived either badly smashed or else sprung and spoiling the appearance of the contents. In fact many of these boxes presented a very non-desirable appearance when opened and set before the judges, and however suitable firkins and handled tubs may be in a grocer's window, they are certainly out of place on an English show bench. There was a very general evenness about the butter, but very few came out on top and away from that same simony evidently originated by the same starter. This rendered the judges' task a very difficult one. In the 2 lb. cured butter class first prize went to

"PRACTICE WITH SCIENCE"

IT will be generally admitted that unless the findings of science are carefully tested by the experience of actual practice, that science is more likely to hinder than to help the farmer. This is particularly true in relation to the question of the analysis of Feeding Cakes and Meals, although the

proposed amendments in the Fertilisers and Feeding Stuffs Act of 1893 will tend to give greater protection to the farmer and improve the position of the honest manufacturer. We do not under-rate the value of the chemist's certificate, for we have always insisted on the importance of a good analysis, and have had our guarantee printed on every bag, as well as on the invoice, which, so far as we are aware, has not been done by any other manufacturer. Moreover, we have always asked our customers to have the goods analysed regularly, and in the event of any deficiency being found, we bind ourselves to pay the analyst's fee and three times the value of the deficiency—

this is our testimony to the value we place on analysis, and to the confidence we have in the quality of our goods. After all, however, the analysis is only the finding of science, and if it were conclusive, then the work of both the manufacturer and feeder would be much simplified; but, as we have often pointed out,

it is possible to show a high analysis and yet leave the cake or meal at very low feeding value, and it is here that science must be confirmed by practice. It is no secret that unsound materials (unless absolutely perished) will in most cases analyse as well as sound ingredients, although the former may be of very little value for feeding; while in the case of oil, it may also show a high analysis, and yet prove to be of a kind altogether unsuitable for fattening purposes. You must test the analysis at the feeding trough, you must combine

The following letter from an esteemed customer, who is a very extensive feeder of stock, is typical of many others received:—

[Cory.]

Dear Sirs,

Greengill, Penrith.
25/11/05.

Having used a quantity of your Fattening Cake, averaging up to 100 tons per annum for the last 13 years, I have much pleasure in stating it has given me every satisfaction.

Previous to using your Cake I was a stout believer in pure linseed, but find your quality of Cake gives better results at considerably less cost. Being both a Winter and Summer Feeder, I also see telling results on my grass land, it being both earlier and sweeter where the Cake has been used.

I might say I have used other Compound Cakes costing less money, but find yours the most satisfactory and always analysing according to guarantee. —Yours truly,

(Signed) THOS. MITCHELL.

Messrs. R Silcock & Sons, Liverpool.

PRACTICE with SCIENCE

if you are to buy to the best advantage as regards price and quality. The feeder's interests are fully protected by our system of doing business, as we not only give a guarantee, but penalise ourselves in the event of any deficiency. Hundreds of farmers bear testimony to the excellence and value of Silcocks' Cakes and Meals for Cattle and Sheep.

CORRESPONDENCE.

The Farmers' Union and the "Mark Lane Express."

SIR, My sympathy and goodwill, in this way, allow me to extend to you to-day; relating to the work you have in hand; keeping in touch with tillers of the land.

Leading to unity with one consent, host of Farmers on improvement bent. No doubt such combination may effect, extensive changes, easy to detect.

Enlightened and concerted action may, bring around and gain controlling sway; pertaining to the land they cultivate; reforms effecting clearly up-to-date; encouraging to enterprise and tact; so the MARK LANE EXPRESS does wisely act, such union to advocate, in fact.

I am, Sir, yours respectfully,
HENRY TYERMAN.

Pontefract, October 8, 1906.

Scabby Potatoes.

SIR,—Can you tell me what is wrong with the potato I send you, and also what can be done to remedy this state of things? Some of my tubers are worse than the one sent. They are grown in England last year, and were from seed obtained in Scotland the previous year. When I planted them there were no signs of scab. WATCHFUL. The sample potato to hand is badly affected by the scab fungus, which is responsible for the brown, cork-like blotches on the surface of the tubers. Opinions are somewhat divided as to the actual cause of scab, but I am disposed to think that it is largely a question of soil conditions. Your seed potatoes were quite clean, and the crop is scabbed, which seems to bear out the above contention. One theory which I am disposed to favour is that in the first place abrasions are made on the tender skin of the swelling tuber by gritty particles in the soil, and the scab fungus follows and does the rest. Scab is much more prevalent in some soils than others, and it often appears where the medium is of a sharp, gritty nature, or when the culture is faulty. I have also noticed that when coal ashes are liberally applied to ground, the potatoes invariably come scabby. In 1905 I had potatoes on a piece of ground of stony character that had been indifferently cultivated, and the crop turned out very scabby. The ground was well worked and cleaned after the crop was lifted, and this spring seed from the previous crop was planted. The potatoes were lifted a few weeks ago, and they were not scabbed anything like so bad as the year before. There is a theory that the planting of scabbed potatoes produces scabby ware, and the soaking of the seed before planting for a couple of hours in commercial formalin at the rate of $\frac{1}{2}$ pint to fourteen gallons is given as a preventive remedy. On some soils potatoes come scabby in spite of anything that is done, but apart from thorough working of the ground, I have found soot to be one of the best preventive remedies. I would not advise you to use rank manure fresh from cowshed or pigsty, but rather material of a well-decayed nature, and, when the trenches are opened to receive the tubers, apply a liberal sprinkling of soot before closing them in. RUSTICS.

Insect and Fungus Pests.

SIR,—Your correspondent, "West Countryman," is right in every word he says concerning insect and fungus pests. May I return to the subject again and invite him and your readers generally to draw the only logical conclusion from his remarks. We cannot hope—more's the pity—to see our Board of Agriculture spending money in fighting forest tree pests. It is done in California and elsewhere, we know, but there the State is run as a business concern, and to try out for that in this country is merely to waste one's breath. Nor is it necessary; for as "West Countryman" truly says, the Evesham district is already showing us the possibility of combined action among growers themselves.

Now if it is possible to avoid hazarding your neighbours' living by turning your own orchards into a breeding ground for insects and disease, it ought to be compulsory to do so. If sheep-dipping is to be required of us by law, why not fruit washing? To keep an orchard which is a veritable nursery for orchard pests—and some of our older ones are no better—is more serious in its effects upon the community than (say) a little petty larceny or the shooting of a partridge without a licence. If these are punishable offences, so should this be, and only by making them so can we hope to force the backward and neglectful cultivator into doing what is expected of him. We have a Diseases of Animals Act; is it too much to hope that some

day an improved Board of Agriculture will be found scheduling the more dangerous field and orchard pests, as it now does swine fever and anthrax, and enforcing the appropriate preventive and remedial treatment?—Yours faithfully,
SEVERSIDER.

Home or Foreign Meat for the Army.

SIR,—It is stated in the public journals of the 11th inst., that at a meeting the President of the Board of Agriculture—I presume merely as an exponent of the Free Trade Government's policy in supplying foreign meat for the army instead of home raised—stated that the result was a saving of £150,000; but this was only one-half statement—of the whole policy involved in the matter, and, as half truths, essentially deceptive. Let us now take note of the facts involved in opposition to this free trading Government's cardinal policy of buying in the cheapest market. Will you kindly give my statements enclosed a place in your next Monday's columns. I thought it prudent, not only in justice to agriculture, but to the whole nation also, that the other half truth should be given immediately on the Government's Free Trade policy in their half truth.—I am, yours very truly,
ALFRED WELCH.

Southall, October 12, 1906.

MEAT FOR THE ARMY.

Home-made versus Foreign purchased.

Take 1,000 men requiring $\frac{1}{2}$ lb. beef daily:—	Brought up 78,000 acres, giving to 8,000 graziers of 100 acres each their living and means of paying rent, taxes, rates, labour, &c.
500 lb.	
7 days	
3,500 lb.	

Waste and cutting up	310 lb.
	3,840 lb.
Would require for supply five oxen weekly of 96 stones each.	

5 oxen weekly
52 weeks

260 per year for 1,000 men.
The Army, 300,000 Oxen, 78,000 of 96 stones each.

78,000 oxen to be raised to stores of a value of £12 each would need the produce of 3 rods of medium grass land each one, a further acre each of rich pasture land to raise them up to 96 stones each.

78,000, £12 each, as stores—value £936,000.

When grazed to £19 each, 78,000 oxen, £1,482,000, value of the 78,000 oxen raised from home land in one year.

£1,482,000 gain from home land and industry.

Further £1,482,000 kept circulating at home, and which must come back to the taxpayer after distribution through various channels of allied industry.

Further valued in above.

There would be the much needed offal for our people—viz., hides, killing fat, head, tongues, heart, liver, horns, tail, tripe, feet, &c.; bones and blood for fertilising the land.

These all retained in the foreign lands by the foreign meat purveyor.

Must not the British public see the great gain to the country in raising from own land the supply of meat for our army of £1,482,000, and of retaining this money in circulation at home, instead of sending it to foreign lands to build up rival industries?

£150,000 Free Trade in foreign produce.

A Variable Season.

SIR,—It is interesting, but sometimes a little distressing, to travel through the country and note on one's way how different districts have fared this season. We have been hard enough hit by the hot drought in the heart of England, but a journey on Monday from Warwickshire through Oxford and into Berks revealed an outlook growing progressively darker as one journeyed south and east. Pastures near home are now beginning to look a little greener, but one saw little sign of greenness anywhere on the Berkshire Downs where the rain seems to have come too late to be of any service. Only twice in this journey of some ninety miles was the plough seen at work, and one gathered that a good deal of ground which should have carried wheat this winter is being kept for spring corn instead. Swedes are poor in Warwick, but poorer south, where all sheep keep seems to be depressingly short. Per-

haps the best thing to be said at present is that the rye, vetches, winter oats, and other winter crops which have been lately sown have gone into a warm and generally a comfortable seed bed, so that they ought very soon to be making a sturdy plant. Yours, &c.,
T. B. VILLIERS.

October 12, 1906.

Yorkshire Prospects.

SIR, Harvest is now a pleasant memory, the weather having been all that could be desired for the gathering of the crops. The stack yards are fuller this year than they have been of late years, there being some good crops—wheat being the best. Turnips and mangolds are good crops, especially the mangolds, the former suffering from mildew, the early-sown ones being the worst in this respect. The recent rains will have done a great amount of good.

The turpins will have a chance to get away now and give a better prospect for the winter. Potato raising has not yet begun to any great extent; what few have are showing signs of disease. The recent rains that have fallen will have a tendency to spread the disease. The pastures are getting bare owing to the drought of August and September, artificial food having to be substituted to keep up the milk supply.

Land is being prepared for wheat, but none has yet been sown. Cold, wet nights necessitate the laying in of the milk cows. Pork is meeting with a fair demand, making 7s. 6d. per stone; beef trade is slow, making 7s. per stone.

October 8, 1906.

ED. HARRISON.

Messrs. Sutton's Experiments in Potato Growing.

The experiments and research in potato growing carried out by Messrs. Sutton and Sons, of Reading, are known to all growers of the important but homely tuber. The scale on which these have been carried out is remarkable, not only for their size, but for their thoroughness. Amongst the experiments are the following:—Trials on different soils of Solanum Commersonii (Lagerberg) and "Blue Giant" potatoes. Trials of potatoes which gave the best results in University, College, and County Council trials last season. Comparative trials of several varieties growing from seed harvested last season in the south of England, Lincolnshire, Scotland, and Ireland respectively. Experiment to show effect of seed fully and also partially matured. Experiment to ascertain the result of planting tubers slightly affected with "potato disease" (*Phytophthora Infestans*). Trials to prove the comparative effect of planting small, medium sized, large, and cut sets. Experiments to ascertain the effect upon the crop of picking off the flowers immediately they appear before the seed-berries are formed. Trials to show comparative value of earthing up and growing on the flat. Experiment to prove the possibility of making varieties which do not usually do so, set their blooms and form berries. Trials of "Up-to-Date" and varieties which to a greater or lesser degree resemble it. Trials of "Abundance" and varieties possessing somewhat similar characteristics. Experiment to demonstrate the result of planting sprouting tubers compared with tubers which have not been sprouted, and have become shrivelled.

It was unfortunate that the day which we had the opportunity of inspecting these trials was so wet, as it prevented a large company, which included visitors from all parts of the United Kingdom, from taking full advantage of an unique opportunity. Mr. Martin J. Sutton presided at the luncheon, which preceded the inspection, and he appropriately referred to the motives which induced his firm to give such close attention to the propagation and cultivation of the tuber plant and also to the laborious and often disappointing, though nevertheless interesting, nature of the work. The task of explaining the lessons taught by the results was ably undertaken by Mr. Arthur W. Sutton and Mr. L. F. Sutton, both of whom have had this branch of the firm's huge business under their special care.

The experiments designed to compare the relative yielding properties of the numerous varieties of potatoes in cultivation have produced interesting results, but, as Mr. Arthur Sutton prudently observed, there is a limitation to the application of these lessons owing to the variations in the conditions of growth in different districts. Perhaps the most conspicuous and generally instructive points brought out are those relating to the marked superiority of Scottish and Irish seed—the latter being in some cases more prolific than the former—over South of England seed, and the equally marked advantage of planting immature instead of mature tubers.

A pamphlet describing the results obtained in the potato experiments is circulated by Messrs. Sutton in full of suggestions, and is worth the attention of all growers on a large scale. The crops, it may be advisable to add, are grown under ordinary farm cultivation.

Fertilisers and Feeding Stuffs.

The High Price of Nitrate of Soda.

It is quite evident that during the coming spring the price of nitrate of soda will be substantially higher than has been the case for many years, a fact which will be seriously felt by many farmers who are accustomed to use this fertiliser as a convenient and readily-available source of nitrogen for their crops.

Ten years ago the price was 8s. per cwt.; five years ago it had risen to 9s. per cwt.; last year it was quoted in October at 10s. 9d.; and to-day buyers are asked to pay 12s. per cwt.

It is alleged that this advance is justified by the continually increased cost of production caused by enhanced pay to the miners and other charges at the mines. This is a point we do not contest.

It is also stated that the continually growing consumption of nitrate throughout the world, and the difficulty of proportionately increasing the output is a natural cause of the price advancing. This again we do not contest, but these combined causes, though justifying the rise in price, do not diminish the hardship which it will inflict, especially on cereal growers.

The quantity of nitrate of soda used for agricultural purposes in this country is about 75,000 tons, so that an advance of 30s. per ton means an outlay of over £100,000 to an industry that can so ill afford it.

The sellers of nitrate point out that after all the rise represents only about 2s. 6d. per acre, and that to the individual farmer this is not a serious matter. With this proposition we do not agree, because the margin of profit on cereal growing is so narrow that the farmer has to exercise the greatest economy all round.

What then can best be done under the circumstances? It is not a practical policy to suggest that farmers should abstain from the purchase of nitrate. It is a necessity in many cases for successful crop raising, but we do say that it is very often possible to diminish without prejudice the quantity applied, and sometimes to substitute another fertiliser for it. While the price of nitrate has been advancing by leaps and bounds, that of sulphate of ammonia has remained without change, so that to-day we have the

phenomenon that both articles are being sold at the same price. This means that we can buy the unit of ammonia in sulphate at 10s., whereas its equivalent in nitrate costs over 13s., or, in other words, if we apply a topdressing of $\frac{1}{2}$ cwt. nitrate we are giving to the crop nitrogen equal to 31 lb. of ammonia at a cost of 18s., while if we apply $\frac{1}{2}$ cwt. sulphate, we are providing 35 lb. of ammonia at a cost of 15s.

Now, in many cases, sulphate of ammonia can be used with quite satisfactory results, or an application of half sulphate and half nitrate is as good a dressing as can be used. The sulphate of ammonia with the superphosphate and, if necessary, potash should be put in with the seed, and the nitrate of soda applied as a top dressing in spring, if the crop requires the additional stimulus. Besides sulphate of ammonia, there are various other forms in which ammonia can be bought, especially in Peruvian guano, and it behoves us to look round and see how far they can be utilised with economy.

We are apparently going to have dearer nitrate for some years to come, and while recognising its great fertilising value and making judicious use of it, we must as far as possible replace it by cheaper substances.

Alcohol for Industrial Purposes.

The new Revenue Act, which is based on the suggestions of the Departmental Committee appointed to inquire into the use of alcohol for manufacturing purposes, passed through Parliament at the flag end of last session.

It provides for a remission of about 40 per cent. in the cost of spirit used in manufacturing processes, and it is hoped that the change will have a stimulating effect on certain trades which have been unfairly handicapped by German competition.

The manufacture of cheap alcohol in Germany from potatoes is a very important industry. The acreage under this crop is about 8,000,000 tons, with an estimated production of 40,000,000 tons of potatoes, of which probably a quarter is converted into spirit for the use of industries, and the consumption of the spirit for lighting, driving motor-cars, engines, and other purposes is continually increasing.

The acreage under potato in the United Kingdom is given in the statistics of the Board of Agriculture as 1,325,328 acres, with a production of slightly over 7,000,000 tons.

The average yield per acre in the United Kingdom is about $\frac{5}{8}$ tons per acre, against $\frac{5}{8}$ tons in Germany.

Small potatoes and diseased tubers can be utilised for making alcohol, and although the price obtained for them for such a purpose is small, it does not require any argument to show what a great advantage it is to have a steady market for such otherwise waste produce.

In Germany almost every important farm has its distillery, and if potatoes show any sign of disease they are at once put into the still, or they can be sold to one of the big factories.

In Great Britain the county of Lincolnshire has the largest acreage under potatoes, 79,564 acres, which produced last year 394,000 tons, equal to about 5 tons per acre.

It is curious to note that the county with the next largest acreage is Lancashire, with 47,697 acres which produced in 1905 the quantity of 414,000 tons, equal to about $\frac{8}{8}$ tons per acre.

This great difference in the yield would seem to indicate that there is room for improvement in the cultivation practised in Lincolnshire.

Under the new Revenue Act, manufacturers in this country have the same chances as their Continental competitors, and it is hoped that capitalists will seize the opportunity to start factories, yielding to them satisfactory returns on their money, and providing work for a number of men in country districts as well as a market for an important branch of farm produce.

Kainit not Injurious to Animals.

After dressing a pasture with potash salts, it is advisable to let a week or so pass, or wait until after a fall of rain, before putting stock in the field, as a matter of precaution, although experiments have shown that kainit and other potash salts are not of a poisonous character. According to experiment, animals will only take kainit in small quantities and refuse food largely mixed with it. In every case where for experimental purposes they have been forced to take large quantities fatal results have not followed.

BRITAIN'S FAMOUS RED WHEAT.

JOHN K. KING & SONS'

PEDIGREE "ESSEX CONQUEROR" RED.

This grand Wheat is the result of continuous Pedigree Selection on our Seed Farms, and for length of ear, stiffness of straw, quality of grain, and productiveness, is admitted to be one of the best and most profitable Red Wheats in existence. The ear is remarkably thick chested, of good length, very compact, wonderfully well filled, and the grain is of superior excellence. It has yielded seven quarters per acre, and on account of its high standard of quality it always realises a very high price for milling purposes.

Sow 2 Bushels per Acre. Price, 8/6 per Bushel; 64/- per Quarter, Carriage Paid.
Special rates for large quantities.

For testimonials and particulars of John K. King & Sons' other Pedigree Wheats, including their famous "Emperor," "Rentpayer," "Square Head" & "Master," "Essex Square Head" and others, see Catalogue post free.

A STEP IN THE RIGHT DIRECTION.

The Lincolnshire Farmers' Union.

The formation of a body which will succeed in bringing about a true union of farmers with a view to laying their legitimate grievances before the public and the Government has always been an ideal with the MARK LANE EXPRESS. On another page we print the history and programme of the Lincolnshire Farmers' Union—a body formed as recently as the autumn of 1904, but which has already met with an exceptional amount of success at the hands of the farmers of what is now our premier agricultural county.

The Lincolnshire Farmers' Union, which we hope and believe is the forerunner of a similar movement in the other agricultural counties, is not directed against any class of persons or any existing institutions—in fact, they look for support from our various agricultural societies and chambers of agriculture, as the union is working on different lines for the same end, and that the very laudable one of the advancement of the farming industry.

The first and most important object of such bodies as the Lincolnshire Farmers'

Union is to bring about combination among farmers. Given this mutual support, there is nothing which the agricultural industry will not be able to accomplish. It should be borne in mind that it is still by far the most important industry in this country, and that it has more capital embarked in it than any other trade, and that more persons of all classes are dependent on it than any other. Without combination its condition must of necessity drift from bad to worse, and it must finally become bankrupt. This would not only spell ruin to those engaged in it, but it would also be a great national disaster of such magnitude as is scarcely realised by our citizens.

Turning to the political programme, we find there is nothing which a farmer cannot support, no matter what his party politics. Amongst the various measures backed by the Union we may instance the "Fires near Railways Act," which comes into force on January 1, 1908; the Butter Bill, the Dogs Bill, the Beer Bill, all before Parliament last session with varying success. A Royal Commission has reported on the better control of motors, and most important of all, the Bill to introduce foreign store cattle into this country has failed. The Union is to be heartily congratulated on the strong part they played in the defeat of this measure. After attending a deputation to the President of the Board of Agriculture, through the energy of the secretary, the Government and the local members were bombarded with evidence—above suspicion—of the existence of mange in Canada, and undoubtedly this had much to do with the Bill falling through. Further, the Union has approved of the Fertilisers and Feeding Stuffs Bill and the Land Tenure Bill, having sent a deputation to Earl Carrington in order to expound their views more clearly.

We have pleasure in announcing that the MARK LANE EXPRESS has been adopted as the official organ of the Lincolnshire Farmers' Union. In future, all reports, communications, &c., prepared by or relating to the Union will appear regularly and promptly in the columns of the MARK LANE EXPRESS. Such a movement as the Lincolnshire Farmers' Union

deserves the whole-hearted support and good wishes of all farmers. We hope that its formation will prove the fore-runner of a gigantic movement throughout the length and breadth of the land, which has for its aim the advancement of agriculture.

THE OCTOBER OUTLOOK.

The copious rains so generally experienced towards the close of last month and the beautiful weather since has proved peculiarly favourable to late autumn culture. Until the rains came a great deal of land was too adamant for ploughshares to penetrate, in consequence of which farmers are now actively employed with ploughs and drills performing work usually effected in September; and there are matters of urgency in the sowings of winter beans, vetches, and catch-crops which demand immediate and prompt attention, otherwise their young plants will not make strong growth sufficient to resist winter severity.

Wheat being the most robust of all the cereals to withstand frost is usually the last of the autumn crops to be put in; but on heavy lands the seed corn of this crop should also be committed to the ground in October, because November has the character of being a rainy month and clay soils often get too soft therein to bear the tread of horses or to make any kind of cropping possible without the greatest difficulty.

The weather of last week could scarcely have been better for thrashing-machine operations, and the period has arrived when brewers commence purchasing malting barleys. According to reports, there are more than the usual average quantity of fairly good samples to be offered this year. So far as brightness and plumpness are concerned, condition will to a large extent be satisfactory. But some are a little too steely to serve the highest purposes of the trade, and only those that come up to the Burton standard are likely to yield 36s. per qr. As yet there is not much animation in the demand, but market rates are better than those for wheat, and the latter being more weighty to measure, should have preference for stock-feeding if there are

animals on the farm of a character to pay for auxiliary feeding.

In all probability, too many farmers of the districts that suffered most from drought will by dire necessity, owing to shortage of roots and hay, have to call the root-pulper and chaff-cutter into more than usual requisition in the coming winter, and the best market for some portion of the home-produced grain will be that of putting it into the mouths of live stock.

Although the beautiful weather experienced since the present month opened has revived the late-sown turnips and caused roots generally to renew their bulbing functions, the nights are getting too long and the days too short for any magnitudinous results to be expected. There are also considerable failures of turnips wherever the soil was at all cloddy and not worked to a perfect tilth, previous to seeding. Throughout the south-west it has of late been the general remark of farmers that never in the general experience has turnip-plant realisation had such marked sequence to perfect tillage and fine tilth. Where these were wanting absolute failure was the result.

Seldom do our greatest blessings come entirely divested of alloy, and even the beneficent copious rainfall has brought one ill; for

where the main crops of potatoes had not been lifted and are still in the ground, super-tuberculation has set in and is only likely to have prodigious development. This will perhaps detract to some extent from the general yield, but we hope harvesting in most districts had been sufficiently advanced or was accomplished before the evil manifested itself for very serious results. There is also a complaint that the earliest crops of mangels are throwing up seed stalks to a marked degree in many districts which, when it takes place, detracts severely from the quality of the bulb from which the seed-stalk springs.

On the whole, however, British farmers have seldom if ever experienced an October which has opened with more cheery prospects than the present one. The cereal harvest has proved a grand one well secured. If there is shortage of roots and hay in the south, there is abundance of both in the north of England, as well as in Scotland and Wales. Moreover, the preponderating influence of the wealthier divisions has been sufficient to advance sheep prices everywhere. The situation, too, has become so favourable for autumn culture, that there is every likelihood of this exerting a favourable influence on the crops of the coming year.

THE FARMERS' DIARY.

TUESDAY, OCTOBER 16.—Lord Rothschild's Sale of Jerseys at Tring—Macclesfield Agricultural Fair—Thrapstone Cattle and Sheep Fair—Kannel Club Show, Crystal Palace, first day—Titchhurst Farm Sale.

FRIDAY, OCTOBER 19.—Great Cattle and Bull Sale, Carlisle—Peterborough Shire Horse Sale—Shrewsbury Great Cattle and Sheep Sale—Droitwich Foal and Shire Horse Show—Entries close for the Collingham Show.

SATURDAY, OCTOBER 20.—Agricultural Fairs and Shows at Easingworth, Chorley, Canterbury, Ashbourne, Devizes, Colchester, and Sleaford—Chichester Hop Fair—Colchester Cheese Fair—Monkton Dairy Fair—Rotherfield Cattle Fair.

MONDAY, OCTOBER 22.—Rugely Horse Fair—Rugby and Easingworth, Chorley, and Wigan Agricultural Fairs.

TUESDAY, OCTOBER 23.—Hereford Cattle Sale at Leominster—Sale of Sir R. Buchanan-Jardine's Galloways at Lookerbie—Claverdon Ploughing Matches, Field Day—Agricultural Fairs at Boroughbridge, Stockport, Tarpoley, Brampton, Bolton, Winchester, and Gainsborough—Salisbury Horse Fair.

PIGS.

Sale of the Barford Herds.

On Thursday Messrs. T. Ensor and Son, of Dorchester and Wimborne, dispersed Mr. H. Standfield's well-known herds of Berkshire and Large White Yorkshire Pigs, in the presence of a very large company of agriculturists from over a wide area, and a very satisfactory sale may be recorded. The average was £6 4s. 6d. for thirty-nine Berkshires, and £6 14s. 4d. for twenty-four Large Whites. The following is a list of the prices realised and averages:—

BERKSHIRE Pigs.—Sow, Lady de Wet, Mr. Wetherall, 5 guineas; sow, Barford Rosa, Mr. A. Hiscock, 17 guineas; sow, Barford Princess, Dr. Lys, 11½ guineas; sow, Barford Lady, Mr. W. C. Martin, 9 guineas; sow, Barford Barbara, Lord Alington, 7½ guineas; sow, Barford Moral, Mr. J. J. Lawrence, 7 guineas; sow, Barford Ethel, Mr. T. Lodder, 7 guineas; sow, Barford Moral 2nd, Mr. James, 7 guineas; sow, Barford Queen, Mr. J. Hansford, 15 guineas; boar (sire Lord Boldre), Dr. McDonald, 9 guineas; boar, own brother to above, Mr. C. Mitchell, 7½ guineas; boar, own brother to above, Lord Wolverton, 6 guineas; sow (sire Lord Boldre), Mr. J. J. Lawrence, 10 guineas; sow (sire Lord Boldre), Mr. A. Hiscock, 9½ guineas; sow, Barford Pastime, Mr. J. P. Chissell, 9 guineas.

YORKSHIRE Pigs.—Sow, Bagber Long Lass, Mr. S. Rowland, 6 guineas; sow, Barford Dolly, Mr. S. Rowland, 7 guineas; sow, Snowdrop 2nd, Mr. A. Hiscock, 12 guineas; sow, Barford Snowdrop 4th, Mr. S. Luther, 11 guineas; sow, Barford Evening Star, Mr. E. Hayter, 9 guineas; sow, Barford Snowdrop 3rd, Mr. G. Haggood, 15 guineas; sow, Barford Chorus, Mr. F. Dowling, 8½ guineas; sow, Barford Snowdrop, Mr. Southcombe, 8 guineas; sow, Barford Snowdrop 6th, Mr. J. J. Lawrence, 9½ guineas; boar, Colston Rover 2nd, Mr. H. R. Jesty, 5½ guineas; boar (sire Barford Emperor), Mr. Cox, 6½ guineas; boar (sire Barford Emperor), Mr. Budden, 6 guineas.

The usual October Horse Fair at Lancaster was held on Thursday, when there was a larger number of horses on sale than for some years past. The horses were a good lot taken all round, a well-known dealer present putting the prices down at from £15 to £40.

Messrs. Alfred Mansell and Co., of Shrewsbury, have recently despatched to various customers in Chile five blood-red Shorthorn bulls of the highest order of merit, a Dutch bull and heifer specially selected from first-class milking strains, one Arab stallion, one Clydesdale stallion, ten Shropshire shearing ewes, four Hampshire shearing rams, and three Small White pigs.

Mr. Robert Walker, a well-known North Lincolnshire farmer, died at South Ferry, in his seventy-ninth year on the 6th inst. He was one of the old type of English farmers, was born in the village, and, with the exception of six years, had spent all his life there. He was one of the oldest farmers on the Sutton Nelthorpe estate.

Notes of the Week.

This year's Dairy Show is one of if not the most successful ever held.

Public support keeps growing in a satisfactory manner, while the exhibits are limited only by the capacity of the Agricultural Hall.

The latter is shortly to be enlarged, and a number of adjoining houses have been bought for this purpose.

Now would be the time to do something to improve the ventilation, as the authorities seem much more reasonable in their attitude to the various exhibition authorities and the public.

Is it uncharitable to suppose that the migration of the Military Tournament to Olympia has something to do with this chastened state of mind?

We look forward with dread to Smithfield week—and fogs—unless something is done to improve the atmosphere of the hall.

Bath and West and Southern Counties Agricultural Society have approached the Corporation of Rochester with a view to holding their annual show at Rochester in 1908.

There was an amusing story some time ago of a confused playgoer who wanted to see "The Spring Chicken," but being unable to remember the title beyond the fact that it had something to do with a bird, was sent by a friend to see Ibsen's play, "The Wild Duck."

Now we hear of an equally astonished old lady who, seeing "The Dairymaids" advertised at the Apollo Theatre, asked the box-office clerk if the "butter test for the Jersey classes" had been decided. She eventually reached Islington just in time.

His Majesty's Government afford facilities for the experimental cultivation of tobacco in Ireland by a refund of one-third of the existing duty.

Similar facilities have been asked for this country, but the Chancellor of the Exchequer will not grant them.

This is preferential treatment, which would not have been expected from this Government.

Our weather prophets must look to their laurels, if Professor Nowak's assertions can be relied on.

He claims to have discovered a tropical plant of a nature so sensitive, that its behaviour for itself for some time in advance, earthquakes, hurricanes, and other natural disturbances.

He is bringing over to this country for distribution throughout the world 1,000 cuttings of the wonderful plant.

It is called "*Abrus precatorius nobilis*."

When the plant bows its head,
We an earthquake must dread;
When its stem stands erect,
We a drought may expect;
When its leaves are too pale,
It foreshadows a gale;
When its flowers are—
[That's quite enough.—Ed.]

Lincolnshire is the premier county in England for the production of cereals, for acreage, and practically for yield per acre.

It also has the largest acreage under potatoes and beans, and, next to Norfolk, Suffolk, and Devon, the widest breadth of mangolds.

During the last thirty years the land under rotation crops in the country has largely diminished, and the permanent pasture has increased by about 90,000 acres.

The weather has achieved another record, as the minimum temperature of one of the nights last week is said to have beaten previous records.

A group of Yankee capitalists are trying, according to New York wires, to arrange a corner in wheat.

The group is said to control thirty million bushels, and intend to hold it until prices reach a high figure.

The movement, if successful, may indirectly be of benefit to some of our growers, who can sell when the price is forced upwards.

How long do seeds retain their vitality? There is a case reported of some foxgloves having appeared on the site of a distended wall. It is concluded that the seeds were 300 years old.

It is said that wheat seeds from Egyptian mummies have been grown, but this does not appear to be thoroughly well authenticated.

Weeds will sometimes spring up in the most unexpected places, evidently from seed which has been lying dormant.

A movement of considerable importance to agriculturists in the midlands is now being promoted in connection with the proposal to convert the University College, Nottingham, into a university with the power of conferring degrees. His Majesty's Inspector in Agriculture has suggested that it would be desirable for the students at the Midland Agricultural College, at Kingstown, in Leicestershire, to be able to take a degree in agriculture, and negotiations are now proceeding with a view to the establishment of an agricultural faculty at Nottingham University, when the charter has been granted.

CATTLE.

Notes and Jottings.

SINCE my last notes most parts of the country have been visited with copious rains which will do an immense amount of good, restoring the water supply to many thousands of fields and homesteads, and though late in the season, the effect upon the pastures is simply magical. Fields that a fortnight ago were brown and parched, and their surface as hard as iron, are to-day softened, and in many places covered with a rich green herbage that is quite gladdening to behold. Where a little old grass had been left upon the land, cattle will graze it now with avidity, and in such places the ordinary store cattle will be able to be kept from the foldyards for probably two or three weeks to come, labour and other expenses being thus economised considerably, and the animals will do better too.

THE price of beef in the majority of the markets is at a terribly low ebb. I do not think I ever saw as good bullocks at the price before as this week in one of the great grazing county markets, where Shorthorn bullocks, cake-fed, ripe, and of first-rate quality, up to ninety-five stone, Smithfield in weight, were offered at 5½d per lb., sinking the offal, and at that offer were hanging on hand until midday. The weather for meat is till very close and muggy, and from this cause

mitted to the public, and a low average results, we are apt to think that that particular breed of cattle is not enjoying the confidence of the public, whereas, perhaps the sale, whether it be a dispersion or a draft, may have consisted of a number of aged cows or a number that were doubtful breeders, coupled perhaps with some rather large proportion of young bulls of not a very high class, or yearling heifers that were not in sale condition. The results have widely different meanings.

IT is rather puzzling to understand, however, the low prices that have for a long time prevailed generally for Red Polls. I notice in your last issue the report of a sale of some thirty head of the above breed from Lord Radnor's herd, where 194 guineas is given as the highest price for a cow and calf. Surely, with a dual purpose breed to deal with and a great scarcity of milk such a price is very low. At the same sale yearling heifers are quoted at from 6 to 9 guineas, very low prices for pedigree stock. If a note were appended to this report to the effect that a dry season had prevented the animals from maintaining their normal condition, or that the cows had been suckling their calves, and were not in form for taking in a milking dairy, and perhaps also getting on in years, if such was the case the explanation would

ducers were seen. The average obtained for the famous herd, the property of the Marquis of Bradenall, was £15 14s. 9d. for thirty-three head, the highest price being 61 guineas. Not excessive figures.

WE read that recently a shipment of ten Ayrshire cows has been made from Scotland to the Imperial farm at Tokio, Japan, five bulls of the same breed also being included in the shipment. It is quite likely that Japan will become a purchaser of many of our breeds of live stock in the near future. Though the island may not be altogether a first-rate one for agriculture and stock breeding purposes, still there is a country with England considerable space. There is also a large population, and whatever the quality of the soil, the climate of the country, or the chief demand of its population, whether milk or meat, we have breeds in England, or rather in Great Britain, that will fill every item the bill may require, and that British stock will be the first to be acquired there is no doubt.

AT last week's London Dairy Show the exhibit of Ayrshire cattle was of a very unsatisfactory nature in all respects. The number of entries was meagre and the animals of a mixed description, varying considerably from what are seen of this breed at the summer shows of the Highland Society, where the breed is usually well represented. One cow certainly gave an extraordinary appearance of milk. What her record would prove in points, pints, and pounds of butter is not known at the time of writing, but as many animals of this breed are known to give a large quantity of milk not lacking in quality, we should not be surprised if this cow gave a rather remarkable account of herself and her breed. As regards the inspection prizes, the most typical Ayrshires, from a breeder's point, were left out in the cold.

WE were also glad to read in another place of the shipment of a collection of Galloway cattle to the Patagonian Land and Estate Company. The Galloway, like some few other of our very good breeds of cattle, has not been patronised half as much as it deserves. A really well bred and what is commonly called "good sorted" Galloway takes a great deal of beating from a grazer's point of view. In any part of England they need no shelter in winter; indeed, are better without it unless altogether exceptional weather should prevail. They fatten very rapidly on good keep, and are just as ready a sale as most breeds when finished. We have known steers of this breed purchased at £16 per head one October, lying out all winter with a little hay on the grass, and fattening the following summer into £30 and over per head.

THE public auctions of Shorthorn bulls in the Argentine appear on the whole to have been satisfactory, good averages as well as individual prices having been realised. An average of over £300 for twenty or more bulls from one exporter, at any rate, has a satisfactory sound about it, while over £1,000 for a single individual is also not to be talked of very lightly. It must, however, be remembered that between the purchase here and the sale there the exporter has to dip very deeply into his pocket for quarantine and shipping expenses, as well as feed; then there is also the insurance premiums that have to be paid, and these, to cover all risks, are pretty heavy. The Argentine has been a great field for English stock, and, in spite of adverse reports, there appears to be no sign whatever of any falling-off in the demand, but rather the reverse.

THE long time axiom of "like producing like" in breeding has seldom been questioned, and in the majority of cases it will certainly be found to be correct. The greatest exception to its correctness that has occurred in my own experience has been in the way of milking cattle. I have known instances innumerable of very heavy milking cows of several different breeds being mated with bulls equally milk bred, and yet the female offspring has proved anything but great or even average in this respect. Why this should be is rather difficult to understand, unless it can be traced and attributed to the way in which the offspring have been treated. When young heifers are too highly fed with the view to giving growth and early maturity, the milk vessels have often been found very deficient and the quantity of milk small when the animal has come into the dairy.

Shorthorn Sales in Scotland. Record Prices.

The annual autumn sales of Shorthorns in Scotland, or "Shorthorn Week," as it is popularly called, commenced on Tuesday, when, as usual, the sale was of drafts from the famous Collynie and Uppermill herds, the respective properties of Mr. Duthie and Mr. W. S. Marr. Collynie is a name to conjure with in the Shorthorn world, and the reputation of Mr. Duthie's herd has been for

SHORTHORN HEIFER, LADY VIVIAN.

At the Dairy Show last week Lady Vivian (sire, Royal Commander, dam, Lady Munster 4th) won the First Prize for Shorthorn Heifers not exceeding three years old, entered in or eligible for the Herd Book, and a First Prize in the Milking Trials. She is the property of Lord Rothschild, Tring Park, Tring, but was bred by Mrs. L. H. Ho land.

would not be without an adverse effect upon the demand; but there must be other very much more potent matter affecting prices to bring them to such a pitch for cattle of this description. The imports into Birkenhead and Liverpool appear to be on a very greatly increased scale as compared with a few weeks since, and this may be the case at other ports also; at any rate, the price is below cost of production.

AS is invariably the case at this time of year, a great number of half-meated, and some positively poor cattle are being slaughtered, that in good seasons would have experienced inquiry from the Norfolk yards; this, too, has no doubt added to the glut in the market. But what can be done to prevent this state of things? We can only hope that the lower prices will reduce the foreign supply for a time, until trade once more becomes active, and that home feeders will as much as possible hold in their stock, improving them by the addition of artificial food, increased until they get into a better state for marketing. The trade of the country is surely not in such a state as to reduce the spending power of the working population, and these are now our largest consumers, so that matters appear to rather point to the oversupply as being at least one of the chief causes of the exceptionally low prices.

TAKING a glance at the result of some of the recent sales of pedigree stock, the prices realised are really very difficult to understand. In these sale reports, however, the condition of the animals is seldom mentioned, a point worth paying more attention to. When a pedigree herd, or perhaps a draft from a pedigree herd is sub-

save the situation a little as regards the opinion the public would get of the breed.

IN the same issue the South Devon sale at Totnes appears to have been fairly successful, or at least better prices prevailed; indeed, the number sold at from 20 guineas to 45 guineas per head was quite satisfactory, and proved that this breed is continuing to increase very much in public favour, whether on account of their milking properties or their dual-purpose character is hard to tell. At the same time, the sale of North Devons at Bishop's Tawton was well supplied, and very fair prices ruling, the best cow realising 35 guineas and her bull calf 20 guineas, several other animals going to 29 guineas, and one or two others over 30 guineas. A note again as to the condition of these would have been instructive, though in this instance it is pretty safe to assume that the animals, being somewhat of a show herd, were brought out in good bloom.

IT is not often that a sale of pedigree West Highland cattle finds its way to the English or Southern press. Indeed, very few sales of pedigree herds of this breed ever appear, yet how many herds of the breed there are in existence? Probably a great number of these are not registered, or, to put it another way, probably very few herds are registered. The English demand for the breed for park and feeding purposes will probably be very slow this year, owing to the quantity of old grass left upon the pastures, even the large parks at noblemen's houses being so very small; yet in travelling a good deal recently more than usual of these shaggy-coated, picturesque, and, we may add, juicy beef pro-

BIBBY'S "CREAM EQUIVALENT" MEAL - - - FOR CALF-REARING.

Our Agents are continually hearing some such remarks as: "I want you to send me two more bags of that 'Cream Equivalent' Meal. It is fine stuff, and I should like you to see my weanling calves; they are a splendid lot—a perfect show."

We like to hear talk like this, and do not wish for a better advertisement of this Meal than these "Cream Equivalent" reared calves are all over the country.

It is quite easy to prepare. It swells out to a fine creamy substance, the calves are fond of it, and there is no scour.

When the calves begin to eat, we recommend a little dry feeding—a mixture of "Bibby" Cake, Oats, and Bran is particularly suitable, the former being at once nutritious and digestible; and calves so reared are always one of the sights of the farm, and make fine well-grown heifers with nice loose skins and plenty of good hair.

One cwt., costing 15/-, carriage paid, is enough for two calves. It costs about 1/3 more to rear a calf on "Cream Equivalent" than on the cheaper calf foods, while the difference in value of the grown animal is most marked, both as to condition, health, and growth.

It is the most soluble Calf Meal on the market, and can be made up simply by soaking the meal in cold water for six or seven hours, if this suits the feeder's convenience better than by making up with boiling water in the ordinary way.

If you are interested in this subject, write for our new circular, "How to Rear Calves for the Dairy." It will be sent free of cost to any address on receipt of postcard.

J. BIBBY & SONS,
Exchange Chambers,
LIVERPOOL.

many years familiar throughout the length and breadth of the land. On Tuesday there were eighteen bull calves from Collynie offered, and seven from Uppermill, and being of the highest standard, prices were, in view of the present Shorthorn boom, expected to be good, but no one anticipated such an extraordinary trade as that experienced.

Hitherto the highest price at these sales was two years ago, when 620 guineas was paid for a calf, but, that was entirely eclipsed last week. Mr. Duthie had the high average of £304 15s. 10d. for eighteen calves, as compared with £226 12s. 6d. for the same number last year. There has been nothing like this at these sales, and the top price of 850 guineas also stands as a record. Only three of Mr. Duthie's draft of eighteen did not reach these figures, and all the rest were well into the "hundreds." A splendid start was made with the first calf put into the ring, Prince of the Blood, one of the four Pride of Avons, which realised three figures. He felt the pulse of the market, for a bid from Mr. Simmers, Whiteside, of 200 guineas rushed him up by leaps and bounds to 830 guineas, when Mr. Deane Willis became the purchaser after a keen competition, the runner-up being Mr. Burno, Westertown. The sensation of the day was reached when the ninth bull calf entered the ring. This was Gold Mint, a beautiful roan son of Mr. Duthie's 620 guineas Collynie Mint, which was exported to Argentina last year. He was at once put up at 300 guineas, and, after a strong tussle between Lord Rothschild's representative and Mr. Stephen Mitchell, Boquhan, the latter prevailed at 850 guineas, which was the top price of the sale. There was no slackening in the demand as the sale proceeded, for the last and youngest of the calves from Collynie, only five months old, brought 500 guineas from Mr. Duncan Stewart of Milbills. Mr. Marr, with a top figure of 270 guineas and an average of £122 5s for seven calves, also did very well indeed. The total proceeds of the sale for the Collynie draft was £5,486 5s. for eighteen head; and the Uppermill draft realised £855 15s. The result of the sale was, therefore, £6,342, an average over both herds, for twenty-five calves, of £253 13s. 7d.

Newton.

The second sale took place at Newton on Insech on Wednesday, and although prices did not rule so high as on the previous day, another very satisfactory sale has to be recorded. The catalogue consisted of drafts from the herds of Mr. A. M. Gordon of Newton; Mr. John Wilson, Pirriemill; Mr. F. Simmers, Whiteside; Mr. A. T. Gordon, Combseaway; and Mr. Merson, Craigwillie; and it was noteworthy that, with the exception of ten cows, the animals offered were under two years old, and most of them were yearling heifers or heifer calves. Trade all through was good, and there was a keen demand for the best class of stock, bidding being very animated for the choicest animals with long pedigrees. Fifteen animals ran well into three figures, and a top price of 700 guineas for a bull calf is not much behind the Collynie record of the previous day. The figure mentioned was got for Newton Comet, a handsome red calf of the Clara family, and got by the home-bred bull Ruddy Star. He was secured by Mr. Phillips, Shipton Manor, Andoversford. Mr. A. T. Gordon's cow, Clipper Duchess 2nd, went to Mr. Scott, Stow-on-the-Wold, at 250 guineas. Mr. Deane Willis giving 240 guineas for the same owner's two-year-old heifer Beauty; while another heifer made 230 guineas to Dr. Anchorena, Buenos Ayres, and one of Mr. Wilson's heifers from Lower Pirriemill, 230 guineas, to Mr. Scott. The averages of the various drafts were as follows:—

Newton: Three cows, £66 10s.; five heifer calves, £53 2s. 7d.; six bull calves, £211 8s. Pirriemill: Five cows, £65 14s. 7d.; one two-year-old heifer, £75 12s.; four yearling heifers, £113 13s. 3d.; four heifer calves, £40 13s. 9d. Whiteside: Four yearling heifers, £110 15s. 6d.; twelve heifer calves, £39 18s. Combseaway: Two cows, £158 11s.; four two-year-old heifers, £138 17s. 3d.; five yearling heifers, £126 8s. 4d.; three heifer calves, £89 12s.

Insech.

After the sale at Newton, the Northern Auction Company, Ltd., conducted a joint sale of Shorthorns in the Auction Mart, Insech, from the well-known herds of the Duke of Richmond and Gordon, Gordon Castle; Messrs. Bruce, Byres, Cameron and Sons, Westside, Breechin; Morrison, Phingask; Murray, Mains of Lessendrum; and Still, Strathray. There was a crowded attendance, and good prices throughout. In the Gordon Castle draft Queen of Spey XII (cow) went to Colonel Smith Grant, Minmore, for 125 guineas, whilst her magnificent yearling heifer calf Queen of Spey XVI made the top of the sale, going to Messrs. Dean and Sons, Dunsbyhall, Lincoln, at 190 guineas. Mr. Dudding bought the cow

For sale this year, 120 Shearing Rams and Ram Lambs at Cirencester, Hereford, Wellington, Bristol, Kelson, Monmouth, Shrewsbury, Cowbridge. Have given good satisfaction for many years.

WHITE, JOHN, Ham Court Farm, Baughton, W. R.S.O., Oxon.—Pedigree Oxford Down Sheep of best and purest strains for sale. Foreign and home buyers invited to inspect.

SUFFOLKS.

KEEBLE, THOMAS, Bentley Hall, Ipswich. Registered Flock No. 66, Suffolk sheep, Winner of two District D Challenge Cups, Bristol Gold Cup, and Pretymann Challenge Cup. Rams for sale for registered flocks or crossing.

PIGS.

LARGE WHITES.

ASHFORTH, JOSEPH, Dronfield, Sheffield. Large and Middle Whites from Royal Winners; unequalled type, flesh, size, and soundness.

HOSKING, EDWIN, Rosevidney, Ludgvan, Cornwall.—Breeder of pure pedigree Large Yorkshire White Pigs; good type with size and quality. This herd has won all the first prizes except one offered for Large Whites at the Royal Cornwall Shows for the last four years; also numerous other prizes. Young Boars and Sows for Sale at moderate prices, bred from winners at the Royal of England.

HUGHES, ALFRED, Packwood Grange, Knowle, near Birmingham. Select Herd of Pedigree, Large White Yorkshire Pigs, bred from prize-winners. Young Boars and Gilts for sale at moderate prices.

KIRBY BEDON HERD of Pedigree Large White Pigs of prize-winning strain. Grand young Boars and Gilts for sale at moderate prices. Hardy constitution, size and bone a speciality.—For particulars apply W. MITCHELL, The Vale, Kirtley Bedon, near Norwich. Two miles from Town station, G.E.R.

LARGE WHITE PIGS.—Boars and Gilts, eligible for Herd Book; also registered Oxford Down Sheep, descended from Prize-winners. At moderate prices.—J. PHIPPS SMITH, Galford Priors, Evesham.

NOTTINGHAM CORPORATION, Stoke Farm. Herd Large White Pigs, established over 20 years. Boars and Gilts at moderate prices. Inspection invited.—A. AVIS, Stoke Bardolph, Nottingham.

OWTRAM, HERBERT H., Newland Herd Pedigree Large White Yorkshires, winners many prizes, Champion Cup and Medal; Brite, Gilts, in pig show for sale.—FARM BAILEY, Newland Hall, Day Horse Station, Lancaster.

(Continued on next page).

Live Stock Record.

DIRECTORY OF BRITISH PEDIGREE STOCK OWNERS.

PIGS—continued.

LARGE WHITES—(continued).

THE NEWNHAM HALL HERD of Large and Middle White Yorkshire Pigs is one of the largest and oldest herds of pure-bred pigs in the United Kingdom. Prices moderate. Inspection invited.—**NEVILLE J. HINE**, Newnham Hall, Baldock, Herts.

THE WATFORD HERD of Large White Yorkshire Pedigree Pigs of the choicest breeding. 150 to choose from. Send for Illustrated Catalogue. Grand young breeding stock always on sale.—**Apply, R. AYRE**, Bushey Lodge Farm, Watford, Herts. (17 miles from London).

WALTON HERD of Pedigree PIGS, owned by Sir Gilbert Greenall, Bart. Walton Hall, Warrington. Large and Middle White Yorkshires, unsurpassed for purity of breed, size and general excellence, as proved by the numerous Championship and Class Prizes won at all the leading shows. A choice selection of Boars and Sows for sale; stock carefully shipped.—For particulars apply to the Manager, **J. HALLAS**, Higher Walton, Warrington.

SUSSEX.

SUSSEX PIGS, LARGE BLACKS. Pure bred and of finest quality, with very small bone and fine hair. Not to be equalled for prime meat.—**FRANCIS N. HOBGEN**, Manor House, Appledram, Chichester.

PIGS—continued.

LARGE BLACKS.

CORNWOOD HERD of High-Class Pedigree Large Black Pigs.—Breeder and winner of numerous Prizes and Cup; Royal, Bath and West, and County Shows. Boars and Sows always on sale.—**JOHN H. GLOVER**, Cornwood, Devon.

PEDIGREE LARGE BLACKS of Choicest Strains, young Boars and Sows For Sale; prices moderate.—**H. J. CLARKE**, Norbury House, Newport, Shropshire.

BERKSHIRES.

BEVAN, C., Mapledurham, Reading.—Pedigree Berkshire Pigs, pure-bred Boars and Gilts, of all ages, and at moderate prices.

CORY, CLIFFORD J., M.P., LLANTARNAM ABBEY, MONMOUTHSHIRE.—Pedigree Boars and Gilts.

CRIBB, ARTHUR LEWIS, Well End Lodge, Shenley, Barnet, Breeder of PEDIGREE BERKSHIRE PIGS. Young stock from noted strains, and eligible for Herd Book, for sale at moderate prices.

PIGS—continued.

MIDDLE WHITES.

DEWHIRST, A., Rycroft Farm, Dudley Hill, Bradford. Pedigree Large and Middle White Pigs also a few Berkshires of the choicest breeding. The following prizes have been won in 1902 by pigs bred by myself: 2 champion prizes for the best pig in the show, 36 firsts, 25 seconds, and 6 thirds, with numerous reserves and V.H.C. Send 2 stamps for Illustrated Book.

PEDIGREE MIDDLE WHITES.—Choice breeding quality, early maturity. Station: Bingham, G.N.R.—**HENRY SMITH, jun.**, Cropwell-Butler, Nottingham.

TAMWORTHES.

IBBOTSON, R., can spare 20 or 30 young Tamworth Boars and Gilts by his prize Boars "Knowle Bounder," "Joey" and "Lycidas." Price 2 guineas and upwards.—**The Hawthorns**, Knowle, Warwickshire.

THE Melton Constable celebrated Herd of Pedigree Tamworth Pigs. Prize winners at Norfolk, Suffolk, and other shows. Champion Cups Smithfield. Several recently exported for Continental and Colonial herds.—**Apply R. OWEN GODDARD**, Estate Office, Melton Constable, Norfolk.

BLAGDON SHIRE STUD, BILLINGTON, LEIGHTON BUZZARD, BEDS.

3 miles from Leighton and Cheddington, L. & N.W.R.,
5 miles from Dunstable, G.N.R. Stations.

CONVEYANCES MEET TRAINS DAY OF SALE.

LOCKINGE MIDNIGHT (18739), one of the Stud Horses.

Unreserved Sale

43 SHIRE HORSES OF THE BEST BLOOD.

On Wednesday, November 7, 1906,
AFTER 12 O'CLOCK LUNCHEON.

MESSRS. SEXTON, GRIMWADE & BECK (of Peterborough) have received instructions from **Mr. CLEMENT KEYLIT** to conduct this high-class Sale as above, which will include 12 Shire Fials, several by Blagdon Benefactor (21141), Lockinge Midnight (18739), Birdsall Menestrel (19337), Dunsmore Jameson (17972), &c.; One, Two, and Three-Year-Old Fillies; Yearling Stallions; also one Three-Year-Old by Lockinge Forest King (18867), and some exceedingly well-bred in-toal Marcs, which are good workers. **Catalogues on application.**

Duchess XLVII. at 63 guineas, but had to give 100 guineas for the yearling heifer Queen. Other XXIV., whilst the grand Collynie stock, bull fell to Drauchoreana for 180 guineas. Other prices ranged up to 80 guineas.

Mr. E. St. John Phillips' Jerseys.

On Thursday the entire herd of pure-bred Jersey cattle, the property of **Mr. E. St. John Phillips**, of Armourie, Magdalen Laver, near Ongar, Essex, were sold by auction by Messrs. Thornton and Co. Jersey cattle have been bred by Mr. Phillips since 1895. The herd has been kept for producing the best quality of cream, which has been sent daily to London. In 1905 there were seventeen cows in milk in the herd, and the cream produced by them was actually sold at an average of over £25 per

head, the separated milk being used for calf rearing. Unfortunately, probably owing to the remoteness of Armourie, there was but a small attendance, and consequently the prices realised were very disappointing to the vendor and the auctioneer, for the thirty-three cows only averaged 9 guineas each and the calves 4½ guineas each, whilst the herd bulls were bought in. Mr. Justice Phillimore was the chief buyer, and his herd will be strengthened by the addition of the cows Coronet (bought at 21 guineas) and Begonia and Evening Star, for which 20 guineas each was paid.

Mr. R. W. Hobbs's Shorthorns.

The sale of Shorthorns belonging to **Mr. R. W. Hobbs**, of Kelmescott, which took place on the 5th inst., proved the most successful since 1903, when

an average of nearly £40 a head was obtained; for this year the figure was £38 18s. 3d. for forty-seven head.

The herd was established in 1878 from Mr. Hobbs's father's herd at Maiseyhampton, and good cows have occasionally been added to it from first-class dairy herds. This year the Oxfordshire Society offered prizes for the best herd of over forty dairy cows. The Bath and West of England offered similar prizes at its show when held at Swindon. The first prizes at both these shows were awarded to the Kelmescott dairy in strong competition.

As the herd has very considerably increased, a selection was offered for sale. It comprised about thirty cows, most of which were young cows and in-calf two and three year old heifers; also twenty

PIGS.

PEDIGREE LARGE BLACKS OF CHOICEST STRAINS.

BOAR, "PROUD SALOPIAN," 1419.

PRIZES WON:—

1st, Royal Cornwall, 1905. 1st, Launceston; 3rd, Bath and West, 1905. 2nd, Wacebridge; Reserve, West Midland Show, Shrewsbury, 1906.

YOUNG BOARS AND SOWS FOR SALE. PRICES MODERATE.

H. J. CLARKE,
NORBURY HOUSE, NEWPORT, SHROPSHIRE.

choice young bulls, nearly all of which were of a deep red colour. They were bred from families that are well known, and naturally came in for good competition from the large company present at the sale. Solo 47th, a first-rate cow by Vain Soldier, quickly ran up to 130 guineas, at which sum she was knocked down to Mr. S. Sandy, who also paid 62 guineas for Solo 49th, also by Vain Soldier. Mr. Herbert gave 61 guineas for Snow-drop 30th by Ivanhoe, and a similar sum was paid by Mr. J. L. Cross for Marchioness 23rd, yet another get of the sire mentioned above. Other cows and heifers made up to 34 guineas, whilst the bulls ranged up to 41 guineas, this sum being given by Mr. Price for Village Swell by Village Lad. The average per head for the twenty-eight cows and heifers was £39 7s. 10d., and for the nineteen bulls £25 16s. 8d., the total realised by the sale being £1,593 18s.

The Chadnor Court Herefords.

Messrs. A. and D. Edwards on Thursday disposed of the herd of pedigree Hereford cattle at Chadnor Court, Dilwyn, which has been built up with excellent judgment by Mr. J. C. Jones, who in consequence of family arrangements is removing to a farm near Knighton and taking up the whole of the stock there, decided to dispose of the Chadnor Herefords, Shropshires, and hunters. Mr. Jones has not exhibited his Herefords, but they are of the best blood of the day, and their popularity was proved by the large attendance of buyers and the good trade. The best price for cows was 36 guineas, given by Mr. Rowlands, Evesbatch Court, for Kitty. Dolly and her heifer calf went to Sir W. Rouse Boughton, at 30 guineas and 20 guineas respectively, the same buyer also giving 31 guineas for Marion 3rd's heifer calf; Mr. C. Coates gave 33 guineas for Dorcas, and other prices for cows and calves ranged up to 29 guineas. The three-year-old heifers and calves made up to 36 guineas, Sir W. R. Boughton buying Kathleen at this figure, while he also gave 28 guineas for her bull calf. The chief prices for two-year-old heifers were 33 guineas, 31 guineas, and 20 guineas; for yearling heifers 26 guineas, whilst for the bull Primate Mr. Rowlands gave the top figure of the sale, namely, 100 guineas.

Stock Sale at Billingham.

The annual Michaelmas sales of stock belonging to Mr. H. F. L-cke-King, Okehurst, Billingham, Sussex, is invariably attended by farmers and breeders from all parts of the county, and the quality of the stock has a reputation which is always well maintained. This year's sale proved no exception to the rule, there being a large attendance on both days. The stock, which was sold entirely without reserve, comprised hackney mares and geldings, fat pigs, pure-bred prize-strain poultry, down-calving cows, store cattle, barren cows, fat and store Southdown tegs, and

draft Southdown ewes and lambs. The cows were Lancashire-bred Shorthorns, and were being sold on account of Mr. Locke King relinquishing the milk contract in connection with the Lower Okehurst Dairy. The young Hackneys from the

Clandon stud averaged about 21 guineas per head; Shorthorn cows averaged nearly £16; and of the Southdown sheep, tegs averaged about 42s., wether lambs about 33s. 6d., and draft ewes about 30s. 6d. per head.

HORSES.

Notes and Jottings.

"He doth nothing but talk of his horse."
— "Merchant of Venice."

THE colour of horses is a very interesting subject. A practical horseman will tell you that a good horse cannot well be a bad colour, which is, like most epigrams, much smarter in the saying than correct in statement of fact. A washy chesnut I would always avoid, no matter how good he might seem to be. They invariably fail you when the pinch comes. At least I have always found them like the lady in the ballad, if "they didn't fear death, they couldn't stand pinching"; and I know nothing more exasperating than to feel your horse going well and strong under you—feel him take off as well and jump as freely as he did at the first fence you rode him at—and then land, a limp bundle, without the list to put one leg before the other. That is one way the washy chesnut treats you. Another way is to curl up the moment anything in the shape of pressure is put to bear on him. No, in spite of the old proverb so frequently quoted, a washy chesnut is emphatically a bad colour when it comes to hard service, and I have not much harder liking for a mealy bay.

ONCE heard a dealer take the shine out of a young exquisite who was wanting badly to buy a pony. The pony was an exceptionally good one, a rare mover, and he could run on all day in harness. In colour he was a black, with a white face, and as is frequently the case, he had a wall eye. Now the would-be purchaser, thinking it quite the right thing to find fault with the pony in order to cheapen him, attacked him on the point of colour. "You buy him, sir," said the dealer, "and you can have him any colour you like"; then seeing a paint-pot about, for he had been painting stables, he added, "green if you like, and I'll throw you a pot of paint in if you buy him." My gentleman not knowing his man, bid well below the price asked, and left the pony. But he hurried back to purchase a day or two afterwards, some friend having told him what a good pony he had missed, and found the pony gone. So a whim about colour in this case lost a man the very horse he was looking for.

IT was, however, the great change which there has come about in the colour of horses since the early part of the eighteenth century to which

I would wish to draw attention. In the days before the Breed Societies were formed, the General Stud Book and the Racing Calendar, &c., were almost unavailable for statistics about colour, therefore it was with the colour of the Thoroughbred that I first intend to deal. And the first thing I would point out is how the grey colour which predominated amongst our Thoroughbreds 150 years ago is gradually disappearing. Let us just take a few meetings which took place in the early part of the eighteenth century, putting on them in haphazard fashion. For example, at York in 1713, out of the seventeen horses of which a description is given, no fewer than ten were greys. Other hinc or ten horses are not described, but it is quite likely that there would be several greys amongst them. At Hambleton again, three years later, six out of the fifteen runners for his Majesty's Gold Cup were greys, and it must be remembered that the Gold Cup at Hambleton brought the best horses of the kingdom together. Two years later, at the same place and for the same event, seven out of twenty-one runners were grey, and the following year at York, eight out of twenty-four runners were grey. In the Hambleton Cup in 1729, seven out of the eighteen were grey. At York the following year fourteen out of thirty-eight runners were grey, and at Hambleton in the same year half the twenty runners in the Gold Cup were of the same colour.

ENOUGH has been said to show how frequently grey horses ran about a couple of hundred years ago. It is not necessary to take one meeting after another at the present day to show the scarcity of greys. Let us take the York August meeting of last year, when one grey ran out of the 149 starters. Indeed, it is a matter of common knowledge which does not require enlarging upon that a grey Thoroughbred is so seldom seen in these days that when he is it is a matter for remark. There can, I think, be very little doubt that chesnuts have increased considerably during the last few years, a circumstance which has possibly its origin in a few big winners having been chesnuts, and in consequence they have been very much patronised. But chesnuts, though they have increased, have not made such a proportionate increase as one would think at first sight. The predominating colour of the modern Thoroughbred is bay, and it is likely to remain so, so long as we have horses like St. Simon, who throughout the whole of his long stud career has only sired one, or at most two chesnuts.

AMONGST Hackneys the chesnut, especially the chesnut with gaudy markings, has increased greatly during the last twenty-five years—indeed, one might almost say since the formation of the Hackney Horse Society, and the commencement of the London shows—by which I do not mean that the increase of chesnut Hackneys is due to the circumstances, but only that it synchronises with them. This, I repeat, easily explained. A few big winners, and especially a few "great goers," in the modern sense of the words "great goers," were of this not very desirable colour. But it was the showy, if not very level action which took with the public, and regardless of anything else they lost colour and other more useful qualities in the attempt to breed horses with extravagant fashionable action. During these later years there has been a gradual, if slow, increase of the number of bays and browns amongst show Hackneys.

IT is an admitted fact that the Yorkshire Coach horse was originally produced by a cross between the Thoroughbred stallion and the Cleveland Bay mare. It is also generally recognised that the Cleveland Bay was the result of a system of crossing between the African horse, the Barb, with the Libyan horse, as Professor Ridgway happily describes him. What, however, is not generally known is that the Thoroughbred horses used were frequently greys. This was probably the case more from necessity than choice. In the days when the Yorkshire Coach horse had his origin locomotion was difficult, horses ran and travelled within a narrow compass of their homes as a rule. And so it came to pass that amongst the horses that were used to put a little style on to the heavier Clevelands was Camillus, a grey colt by Hamiltonian out of Faith, a grey mare by Paeolet (grey), her dam Atalanta Paeolet was by Blank out of Whiteoak (grey) by Crab (grey). Many years after Camillus had joined the majority, a great grandson of his, Monarch by Fill o da Puta, was used as a cross. Yet, notwithstanding

ing the prevalence of grey in the pedigree of Camillus for generations, it has entirely disappeared amongst his Coaching descendants, if, indeed it was ever there at all. Of course it is impossible to be certain on the subject, for the Yorkshire Coach Horse Society would not admit into their Stud Book a horse of any colour except bay or brown. Still, bay was always the fashionable colour with Coach horses, and though on one or two occasions grey Coach horses have won prizes, even at the Yorkshire the cases have been so exceptional that I do not remember seeing a grey horse shown in a Coaching class. This fact of the grey colour being completely crushed out as it were by the bay of the Cleveland Bay foundation seems a strong confirmation of Professor Ridgeway's theory about the prepotency of the Libyan Bay. Also as a corollary it would seem to support the theory that the Cleveland numbers that have amongst his illustrious ancestors.

THE remarkably true way in which Cleveland Bays breed to colour has always been held as a great point in their favour, and as a proof of the purity of their breeding for many generations. And so no doubt it is. But "sports" in colour are by no means unknown, though they are of but rare occurrence. When they do occur the colour is always chesnut, but it is a curious chesnut, very nearly approaching a golden bay. Indeed it would almost seem as if the only difference between one shade of bay and the chesnut to which I am alluding is the colour of the mane, tail, and legs. I once heard a man say, after looking at young horse over, "If he hadn't had black legs and a black mane he would have been a chesnut." This, perhaps, best describes the colour I mean. I have known a few of this chesnut colour in my time—not many. I should say some half-dozen at the outside, perhaps not so many, and strange to say they were all of them mares. One was a really handsome mare, and if it had not been for the black mane and tail and the red legs no one would have called her a chesnut. She was a rare breeder, and she never bred one wrong colour, neither did her daughters. I do not remember if any of her sons were kept for stallions.

THE "Surgical Anatomy of the Horse" is the name of a book of which the first part has just been issued by Messrs. Williams and Norgate, Henrietta Street, Covent Garden. The author is Mr. John T. Shaw Jones, Lecturer in Charge of the Department of Veterinary Anatomy in the University of Liverpool, and formerly Tutor in Surgery and Demonstrator of Anatomy at the Royal Veterinary College, London. In his preface Mr. Shaw Jones points out that it occurred to him some years ago that students made very little real use of the subject of anatomy in the diagnosis of surgical affections and in the practice of the surgical art. He points out that anatomy and surgery have been taught separately, as subjects independent of each other, and it is to supply the connecting link between the two that he has undertaken the book under notice. Of course, the book is not a complete treatise on the anatomy of the horse, only those parts of anatomy concerned in the practice of surgery being treated of. The first part treats of the head and neck, and the arrangement of the divisions of the subject are clear and easy to follow; the importance of good illustrations is duly considered, and the illustrations given explain the text in an excellent manner. The book is, of course, of a highly technical character, and I have not had time to study it carefully. But as far as I have seen of it, I think Mr. Shaw Jones has done what he set out to do. Though more for a veterinary student than an ordinary horse owner, the latter might spend his time worse of a winter evening than by studying it a little. What would otherwise be dry and perhaps not very easy to make much use of, is made lucid by the excellent illustrations. The price of each part is 15s. The four parts will be issued.

THE LOOKER-ON.

Mrs. Thompson's Shetland Ponies.

A good draft of pedigree Shetland ponies from the successful stud of Mrs. Thompson near Chalfont St. Peter, Bucks, was brought under the hammer on Thursday. The attendance was large, several noted breeders and exhibitors of dwarf ponies being present, but the result was disappointing, for only two lots were sold. They were the 35in. brown mare Lassie and a black colt foal by Vengeance—Beauchamp Jeannie. Mr. Acland bought both lots 20 guineas and 9 guineas respectively. There was keen bidding for the exceedingly smart turn-out made up of the match pair of 35in. brown ponies Mamelouille and Buttercup together with an American pony buggy. The ponies, which were a beautiful match, were well driven by Miss Thompson, but the highest offer for the whole turn-out was 55 guineas, and the lot was withdrawn. The 35in. stallion Vengeance, bred by Lord Londonderry, was also withdrawn at 31 guineas. Several foals which looked promising were run up to fair prices, but only one changed hands.

SHEEP.

Notes and Jottings.

THE generous rains and warm weather of the past week or two are improving the prospects for sheep keep of all kinds, but there is a serious drawback to make up which the most favourable weather cannot accomplish. One of the worst features of the drought in the driest districts is the rotting from mildew (*Peronospora parasitica*), which we have seen with much frequency in widely lying districts. This is a severe blow, as the swede crop is immature and affords little feeding matter at this stage, and it is useless to leave it where it will become putrid in a short time. Moreover, it directly affects the winter's food supply. When one gets out of the districts where drought has been so persistent excellent crops are to be found. Ireland and Wales are full of keep, though occasionally in these moist climates fields may be seen which have been severely punished by the wet weather; there are, however, blessed with an exceptional growth of grass, which will place them in an independent position for months to come. In the southern half of the country there is a striking illustration of the mistake of trusting too much to the turnip crop. The most keep we have seen on any land is where kohl rabi were set in early; while in more than one case in the same field the swedes, not half grown, are stinking from rot.

IN course of conversation with a dealer in the west of Ireland a few days since, I stated that he had never known any of the west and north-west counties to have been drained so hard of sheep as at the present time. Since June there has been a thorough scouring of all districts, as dealers have been having an exceptionally profitable season, for any sheep they could get into their hands left them several shillings in hand. In the mountain districts the Black-faced Scotch sheep are doing much better than the native sheep of twenty years ago. Probably no better results are being obtained than in Co. Kerry, where the old short-tailed Mountain sheep has almost disappeared. In point of wool constitution, and earlier maturity the imported sheep are found much more profitable than the native sheep, and this is recognised by even the smallest breeders. The fewer deaths in winter is alone sufficient to make the breed more popular. The old Cottagh sheep also has practically passed away during the last dozen years, very largely through the agency of the Black-faced crossing, though not entirely, as in districts in which it was then found, a considerable number of Roscommon and other breeds may be met with. On the whole there seems to be an awakening to the value of sheep farming throughout Ireland, which the poor prices for store cattle have emphasised. Irishmen with their love of a horse and respect for a bullock, have never been a really sheep loving race. Even now, though they see the profit attaching to sheep keeping, they have not yet become a shepherd people in the sense that Scotchmen and Englishmen are.

WITH mangel lifting here, another source of food becomes available for sheep. Mangel leaves are relied upon for sheep food in some districts, while in others they are looked upon as dangerous, and are avoided. There is no reason to suppose that there is any marked difference in the constituents of the leaves, though possibly on some of the clays where there is much potash available, there may be more taken up than on lighter soils. Mangel leaves contain more potash than is found in any of the ordinary farm crops, and it is most likely due to this that scour out infrequently occurs when they are given to animals. Young sheep certainly are liable to scour when they are allowed to eat them freely, and hardy old sheep sometimes suffer in the same way. It is not desirable that they should form the bulk of a sheep's dietary, but should be regarded as an additional food. Where it is intended that the leaves will be given to sheep, it is a good plan to fill in all gaps with cabbages or kohl rabi, or to drill an occasional row of one of these crops at seedling time, so that there will be alternative food, if this provision is made, the sheep will attack the safer food whilst their appetite is keen, and are less likely to suffer. Dry food is certainly most desirable when mangel leaves are being fed; in fact we would never feed them without it. In a season like the present, when many districts have a short supply of winter food, there may be those who are hesitating to use the leaves, although they hadly need to make use of anything that is available; if they exercise care, there is no reason why they should not give them to sheep, but if they turn sheep into a field where they can gorge, and allow them no corrective, there is considerable likelihood that they will regret it.

THE price of store sheep is good in spite of shortness of keep in some districts, and it will be as much as some will manage to get them through the winter with much profit on account of the large amount of extra food that will have to be given. In seasons when the food supply is pretty universally short, prices of stores fall so low that every effort that will keep the sheep going until spring food comes in again is worth making, for a life is a life at such time, and prices rise greatly. We remember a neighbour some few years ago who, with a far lighter root crop than ordinary, carried double his usual complement of sheep, because, owing to a failure of winter keep, he foresaw that at the price he could buy in the autumn, could he but keep them alive until keep became plentiful again, he was bound to make a large profit. He got his sheep through all right and made several hundred pounds by doing it. He bought straw and haystacks, chaffed all, and gave bran, malt comings, and maize to induce them to eat the chaff. He eked out the root crop economically that all got a taste daily—though sometimes it was little more than a finger of turnip—and scarcely had an ailing sheep. They were not very fleshy when food came again, but they soon put on flesh, and he got out of them well.

Sale at Sittingbourne.

The ram supply at this year's annual sale at Sittingbourne was rather larger than usual, and in the absence of the export buyer the home breeders were able to purchase with advantage. Those who have made it a practice to attend this annual sale for some years agree that seldom, if ever before, had Mr. M. Bursted a better lot of rams from Registered flocks to offer them, and although the averages were lower than last year, it speaks well for the demand to note that the whole of the rams offered were sold.

The best lot of rams entered were those belonging to the Evers, of Mr. W. Elvey, and for them there were plenty of buyers, who secured rams of good merit at prices fully under £2 to £3 per head lower than would have been the case at Ashford sale. Here the top figure was 11½ guineas to Mr. Ledger, who gave 10 guineas for another. Mr. Read gave 11 guineas, Messrs. Gamble and Crauford paid 10½ guineas for two. Mr. Miller purchased at 10 guineas and two at 9 guineas. Another remainder ranged down to 5½ guineas, with an average of 49 9s. 5d. for nineteen.

Lord Harris had the second draft of the Belmont rams on offer. All were sold; and the range of prices was from 12 guineas, at which figure Mr. W. W. Chapman got the top-price ram of the sale. The same buyer took three others at 8½ and 5 guineas, Mr. Tuplow purchased several at from 10 guineas, several others making about 8 guineas and down to 4½ guineas, with an average of 47 14s. 6d. for twenty-five.

Mr. M. Bensted, an old patron of this sale, met a good demand, but at somewhat a lower average than usual. Twenty-six of these rams were offered, and all sold, Mr. P. Cornwell taking the best one at 11 guineas, a real good ram. Mr. Warren gave 10½ guineas, Mr. Seager 10 guineas, and the remainder went from 9 guineas to 5 guineas, giving an average of 47 7s. for twenty-six head.

Mr. P. P. Mainwaring's consignment were not in first-class condition, and consequently failed to secure so good a demand as their type and breeding would otherwise have entitled them to; these ranged in price from 5 to 2½ guineas, and averaged 43 10s. 1d. for seventeen.

Lieut.-Col. Honeyball's Norton Rams, a well-bred lot but lacking in condition, sold at low prices, the average for the seventeen head working out at 42 18s. 9d., at prices from 41 15s. to 42 10s.

The supply of store sheep was a large one. Mr. Bensted's annual sale is becoming increasingly popular with the vendors, for invariably there is always found a good demand. This was the case to-day, and the larger number of culls, whose aggregate total was about 6,000 head, left the ring unsold. So far as could be ascertained, the range of prices for the several ages, &c., were as follows:—

Kent ewe lambs up to 33s., Kent wether lambs up to 31s., Kent ewe and wether lambs mixed up to 29s., half bred lambs from 31s. to 15s.

Bagshaw's Footrot Dressing has by its success earned for itself widespread popularity, and among other places at which it has been used may be mentioned the Royal farms at Windsor. An eighteen-penny bottle contains sufficient to dip 20 sheep, while the larger size of four-eighths comes cheaper. The dip is made from the original receipt of Mr. J. Bagshaw by Messrs. Grimwade, Ridley, & Co., Princes Street, Ipswich.

Sold by Cake Merchants and Dealers.

HOPS.

The Official Crop.

We have all been exercised in mental calculations concerning the official figures, and some of us have ventured to back our opinions in the substantial form of a wager or two. The figures being now in our possession, our doubts are resolved and our bets are settled. It is not too much to say that the majority of us are surprised, and are disposed to question the correctness of the estimates. When we are told that the total yield of our plantations amounts only to 245,688 cwt., and that this average is not more 5-26 cwt. per acre. If this be true, we must go back to the famine year of 1882 to find so small a total. In 1890 the average of 53,961 acres was returned the same as we now have it, but since then we have had nothing so low, except in the 1904 season, when the average was 5-91 cwt. I feel some hesitation in venturing to express an opinion opposed to an official dictum, but am compelled to join issue with the present statement, which I cannot accept as really representing the actual yield. The "patchy" character of the growth this season has created special difficulty for estimators, whether private or official, but I think there is quite sufficient reliable evidence that an average of not less than 6 cwt. has been harvested,

which will bring up the real crop to over 280,000 cwt. My view of the position would incline me to go further, but I adhere to 6 cwt. as a minimum which I feel confident has been realised.

But taking the returns as they stand, and examining them in detail, we find the lowest averages of 3-48 cwt. in Salop and 3-85 cwt. in Hereford, these being manifestly below the known facts. Next comes Surrey with 4-37 cwt., which is probably near the mark. East and Mid-Kent are shown with 4-69 cwt. and 5-09 cwt. respectively. I am aware of some serious failures in these divisions, but am also satisfied that some districts were sufficiently favoured to raise the average much higher. The figure attached to the Weald of Kent, 7-33 cwt., appears as if it should be nearer to the correct average for the whole county. Concerning the figures given for Hants (5-29 cwt.) and Sussex (5-04 cwt.), there does not seem to be much room for question, so far as my information enables me to examine them, but I am sufficiently well informed about the crop in Worcestershire to conclude that the official average of 4-87 cwt. might safely be increased by about 15 per cent.

The returns are, however, issued with the imprimatur of the Board of Agriculture, and cannot be altered by criticism. They must remain on record, and will, I trust, have an enlivening effect upon our dull trade, and assist planters in getting in a little "more grist to the mill."

Imports and Exports.

The official returns of our foreign trade for last month show us that the inflow of hops from abroad continues to be active. We have received during September from America 1,406 cwt., and from other countries 7,626 cwt., making a total of 9,032 cwt. This is an increase upon the previous month of more than 3,200 cwt., and also exceeds the imports of September, 1905, by nearly 4,500 cwt. Our exports are falling off, as they only totalled 451 cwt. against nearly 780 cwt. in August, and 1,224 cwt. in the previous September. Taking the two months together, as having most influence upon our new market. I regret to find that the foreign trade is becoming more and more opposed to our interests, inasmuch as the quantities retained for home sale in August and September, 1906, amounted to 13,558 cwt., and in the corresponding period of last year the total was only 3,756 cwt. Thus we start the season with an additional load of nearly 10,000 cwt., this fact probably explaining to some extent the depression under which our planters are now bowed down. Unfortunately, it is a burden from which we cannot escape so long as fiscal reform is shelved. Our competitors may possess certain advantages over us in the cost of their produce, but under any conditions their surplus must be disposed of, and they naturally look to our open ports for their outlet.

ADVERTISEMENTS RECEIVED TOO LATE FOR CLASSIFICATION.

KENT.

MAIDSTONE FAIR.

MESSRS. AMBROSE & FOSTER beg to announce they will **SELL BY AUCTION** at Maidstone Fair, on

WEDNESDAY NEXT,

OCTOBER 17, 1906,

Milking Competitions.

WE have got machines for performing a good many tasks on the farm that used to be done by hand, but the automatic milker remains in the background, and the manipulation of the cow's teats by the human fingers is the best known means of extracting the milk from the udder. This means that it is essential for the large dairy farmer to have a staff of expert milkers, and with the object of encouraging an interest in this important branch of farm labour milking competitions are held in connection with the dairy show at Islington. We have already pointed out that labour competitions are good as a means of education and arousing interest, and we see no reason why the example set at Islington should not be followed in districts where milking is such an important item of labour. In the old days when all the milk was kept at home it was not so important that the work should be completed in a given time; but now that the liquid has to be cooled and at the station by a certain hour, the farmer must have an expert staff and know their capabilities. "Can you milk?" is the first question asked by the dairy farmer when engaging a new hand, and compared to this other qualifications are of minor importance. In view of this it seems to us that nothing could be more useful in dairy farming districts than milking competitions in order to make the growing youths and girls more expert.

Mildewed Turnips.

NOW that we have had rain, and the general effects of the long drought are gradually disappearing, the miserable appearance of many fields of turnips suffering from mildew shows up more plainly by the contrast. Mangolds have very much improved since the dry weather broke up, but in the case of many pieces of turnip, the mildew fungus had got a too firm hold to be easily removed. Of course the repeated washing of the leaves by the recent rains has had the effect of improving matters somewhat, but a lot of mildew still remains in some pieces of roots. Are these mildewed roots good for sheep and lambs? The point is worth considering, but I cannot see how they can be wholesome, at any rate for lambs or sheep under a year old.

Forestry.

IT is a good thing to observe that there is a general awakening to the importance of paying more attention to forestry in this country. That there is any waste land in Great Britain at all that might be cultivated and

would grow something is a national slur, and it is greater when we realise that there is a good deal of land that might be utilised for growing trees now producing nothing. On every estate of any size there is a certain amount of wood, but the management of this department is very often open to criticism. In fact, in many cases, there is no management at all except mis-management, and the so-called woods are merely fox coverts or game preserves. If forestry is to be taught, however, it must be taught properly, and real, well-managed woods should be established for the purpose. The State is in a better position to carry out this work than any private individual, and there are Crown lands and forests suitable for experimental purposes. Surely there is no reason why the matter should lag.

Poultry on Newly-Ploughed Land.

THE usefulness of poultry for destroying ground insects is generally admitted, and the other day we had an ocular demonstration of the fact. Two or three teams were ploughing in a field in which some weeks ago moveable poultry-houses were placed on the stubble. Behind each plough was a flock of hens greedily pecking away on the newly-turned furrows. The ploughshares were turning up wireworm and various other grubs, and as fast as they appeared in view there was a scramble amongst the fowls for the dainty morsel. It would, of course, be impossible to say how many wireworms and other insect pests the poultry disposed of, but the number must have been considerable, and we question whether farmers make enough of their fowls as a means of

destroying ground pests. In scores of cases the poultry never leave the precincts of the farmyard for fear—some tell us—that foxes should have them, but with moveable houses and reasonable care they can be protected, and while the fowls are all the better for being moved about, they may be usefully employed in the cause of cultivation.

The Care of Orchard Fruit Trees.

IN the orchard counties in the West of England there is a commendable desire on part of persons interested in the matter to develop the fruit-growing industry as a branch of farming. It is a praiseworthy desire, but unfortunately there are many obstacles in the way. An orchard apple tree is not a thing that commences to show a profit directly it is planted, but some years must pass before any return can be looked for. Just so, and the farmer argues that his tenure is not secure enough for him to plant trees, knowing that some years must elapse before he can reap any benefit from them, and in the meantime he has the trouble and cost of cultivation. The argument is reasonable enough, but there are two sides to the question, and there are a number of landlords ready and willing enough to plant trees if the tenants will look after them. No the latter always do this? No, alas! no; as scores of illustrations will prove. The necessary looking after is more a question of timely attention to detail than anything, and this is where there is room for complaint. Young trees are planted and properly fenced against cattle, but fastenings will break and wear out and the stems and branches of the trees are rubbed and bruised on the fences put to protect them. Fences break down and stock gnaw the bark of the trees, pruning is neglected, and rank weeds are allowed to grow up and choke the stems. These are but a few of the items of neglect to which newly-planted trees are subjected, and if an estimate could be given showing how many standard trees have been planted in the past ten years or so, and have failed through sheer inattention, the figures would be startling. Surely orchard husbandry is a difficult between a landlord and a tenant.

Basic Slag for Grass Land.

A STORY is told of an old gentleman who was a bit cracked on artificial manure getting out of patience with his bailiff, who was a decided sceptic, and exclaiming that the day would come when he would be able to put enough manure in his waistcoat pocket to dress an acre of land. "Very likely, sir," was the dry remark, "and

METHOD OF SELECTING SEED BARLEY.

you're bring th' crop home in 'tother pocket.' How times have changed, to be sure, since prebible above artificial fertilisers, equal to the above instance, prevailed amongst farmers! Instead of being averse to the use of artificials, the farmer's trouble to-day is that he cannot get as much concentrated manure as he would like, though he has lost not a bit of his faith in the virtues of dung. The time has now arrived for seeing about slag, and in grass-growing soils that respond readily to this fertiliser its use has increased wonderfully of recent years. The farmer is proverbially slow to move, but give him ocular demonstration of the value of a certain thing, and he readily sinks his prejudice in favour of it. Autumn is the time for applying slag on land that is lacking in lime, and in this particular arm's show a willingness to combine. In fact, they can see that by working on co-operative principles slag and other fertilisers can be obtained at a much lower rate than if each one acted as a unit.

The Use of Gas Lime.

It is at this time of the year that persons who have faith in the value of gas lime see about getting it on the land, but a wide difference of opinion exists regarding the virtues of the above material. In the first place, gas lime is used as a purifier and insecticide for the destruction of ground pests, and to effect this purpose it must be used in a fresh state. But fresh gas lime contains compounds of a poisonous character, and if used too freely may entirely ruin the prospects of plant growth for a year or more. It is doubtless wrong or over-applications that have got gas lime into bad odour in some quarters, but gas lime that has been exposed for some time to the air is a comparatively mild material, consisting largely of gypsum, and if applied at the rate of two or three tons to the

acre on stiff, clayey land it improves the texture of the soil, and has a beneficial effect on the next season's crop, particularly if the latter happens to be mangold.

Experiments in Potato Growing.

THE reports on the experiments in potato culture conducted this season by Messrs. Sutton and Sons, of Reading, are interesting reading to persons who are concerned with the growing of the cosmopolitan tuber. One interesting trial was that of growing several varieties with rod peelings and dung as manure. It appears that in some parts of Berkshire the cottagers use rod peelings as manure for potatoes with considerable success, and it was decided to put them to the test. The result was that rod peelings produced a heavier weight of potatoes than manure, but, of course, the former are not a commercial commodity, so that the trial was more interesting than useful from a general point of view. Another useful experiment was that to prove the results of planting matured and partially matured sets. Returns were in favour of the latter, and we think that in this direction there is opened up a fresh item in potato culture that will demand the attention of growers in the future. The comparative results of varieties grown from seed harvested last season in the south of England, Lincolnshire, Scotland, and Ireland showed the undesirability of planting seed tubers raised in the South. Most people are agreed as to the advantages of planting Scotch-grown seed potatoes, but it would appear as if the land of the thistle will have a competitor in the future in the growing of seed potatoes, as the merits of seed tubers raised in Ireland for growing on English soil are rapidly ascertaining themselves. Will Old Ireland rise to the occasion? Let us hope so.

complete expression shall be given to the Three F's. We shall assert that the landlord is but the sleeping partner in a great industry, and is but the trustee of the State." "If I had my way," went on Mr. Rowlands, "I should rather Mr. Channing's Bill were embodied in law than Mr. Agar Robartes' measure. I say this because it has a more distinctive and affirmative character. But in future legislation we shall be even content with Mr. Channing's Bill. Let the House of Lords throw out this Bill, and the act will be the preface to legislation of which the most noble peers never dreamt."

Liberals and Mr. Robartes' Bill.

As these dogmatic assertions were being uttered Mr. Rowlands was surrounded by at least a score of Members of Parliament, and everyone associated themselves with his assertion. Two London members, in the persons of Mr. Horace Myers and Mr. Bertrand Strauss—of course, your supreme authorities on the land—declared at once that they would hail with joy the defeat of the Land Tenure Bill, because they would regard that defeat as an incentive to more rigorous methods and to a more rigorous policy. They made no profession of great friendship for this Bill. They hailed it, in fact, as little more than the foundation of a structure of reform. They regarded it as but the basis of the edifice. If I were to interpret their speeches, I should say that they regard the Bill as a mere experimental preface, lacking solidity and strength. And, frankly, I believe this epitomises the general Liberal attitude.

Lord Carrington's New Tribulation.

We are to have a sequel to Lord Carrington's declaration of sympathy with his own report as president of the Welsh Land Commission. I find that a number of politicians, including several Parliamentarians, have decided to initiate a movement whose purpose will be to seek the establishment of land courts in England. Of course, I need not say that these politicians are all Radicals. No comment is necessary on the effort; but I may add that Lord Carrington has himself only to blame for this new addition to his tribulations.

The Agricultural Machinery Trade in Sweden.

His Majesty's Consul at Gothenburg, in the course of his report, states that foreign competition in machinery, implements and tools has latterly become very keen in Sweden, especially from Germany and the United States, whence, according to competent reports, fairly good and cheaper goods are supplied. It would appear as though the foreigner exactly knew the cost to the British maker, and was therefore in a position to undersell. The United States having, *via* Denmark, made Sweden their dumping ground for the immense output of their agricultural machinery industry, it is quite natural that the sale of British articles of these kinds should fall off.

Native industry has greatly developed in this direction, and the comparative cheapness of labour and material also conduces towards lessening the British manufacturers' prospects in the market he formerly commanded almost solely. Belgium and Germany have latterly appeared as formidable competitors to British trade in manufactured and other iron. The former country especially, by offering a very honest article and, of course, a lower price, has in many instances proved a severe competitor to English industry. Germany, on the other hand, does not enjoy the reputation of good quality, but her endeavours to satisfy the cry for cheapness have certainly benefited her on many occasions.

At a meeting of the Stockport branch of the Cheshire Milk Producers' Association it was resolved to increase the price of milk by members of the association to 2s. 6d. per dozen quarts. This is an increase of 3d. per dozen quarts on the winter prices.

A Land Tenure Conference.—Mr. James Rowlands, M.P., the hon. secretary of the Land Law Reform Association, has received a letter from the Minister for Agriculture, in which he says:—"I shall be delighted to accept the invitation of the executive committee of the Land Law Reform Association to attend a conference on the subject of the Land Tenure Bill on the 22nd, and I hope that you will express my grateful thanks to your committee for the compliment of asking me. The feeling in favour of the Bill is increasing daily, and I confidently look for the support of the whole of the army of progress in my endeavours to get the Bill passed into law."

Agricultural Politics.

BY A LOBBYIST.

Lord Carrington and Scotch Farmers.

Earl Carrington has the great quality of courage. It is of no small moment that he confronted the Scottish Chamber of Agriculture. That body is against the Scottish Land Bill, against it probably because of the conception—it may be a misconception—that it will operate to the disadvantage of the general farmer. An uncouth phrase, I admit, this of "the general farmer!" By it I mean the farmer whose area is beyond fifty acres. Of course, Lord Carrington has more than once declared that, small-holder protagonist though he be, he is by no means the antagonist of the big farmer or believes that he does not play a useful part in the nation's economy. This fact, however, was apparently forgotten by the Earl's Scottish auditors, and as a consequence he was regarded with somewhat of a suspicious eye. After all, however, there is some excuse for the Scottish attitude. By this I mean that the Scottish Land Bill is the most significant departure in economic ever embodied in a Parliamentary measure. Applying only to the probable cultivators of small areas, it has undeniably rather appalled the men whose acres proceed beyond a hundred. Well, the Scottish attitude was only one of criticism and of suspicion.

Is Dual Ownership a Radical Anxiety?

Is Lord Carrington also a protagonist of dual ownership? I ask this because of a phrase of the Minister for Agriculture in a recent speech. I also ask this question with some foreboding because of the fact that the Land Tenure Bill is but the forerunner of the Liberal scheme of land reform. If Lord Carrington is in favour of dual ownership—and his use of the word "partner" as applied to his tenants is an evidence that he is—then it is morally certain that dual ownership will be embodied in the Liberal scheme. Has it paid in Ireland? Would it pay—and I purposely use this illustration because of Lord Carrington's known anxiety for a specific Welsh Land Bill—in Cymru? The Irish example has not been a success. It may be urged that this is due to its having been an experiment, and that all experiments have associated with them the possibility of failure. It must not, however, be forgotten that it has been so long in operation as to have shed this infirmity of all great purposes. May I put this question specifically to his lordship: Does he, in his future legislative designs, intend to graft on to land reform the principle of dual ownership?

Is a Land Court Justified?

I fear me that Lord Carrington will become the King Charles' head of my article. Well, his lordship is to blame. He is the most ubiquitous chief that ever presided at the Board of Agriculture. In other days I heard the Earl described as a Sybarite. In the present day he is the hardest worked member of the Ministry, and he seeks to justify his Ministerial existence by continuous contact and association with the farmer. Now, with this preface, let me ask his lordship if he behaved with his characteristic generosity in accepting that enhanced rent of a hundred pounds. The story which he told to the northern farmers at Newcastle of a farmer who, dissatisfied with his rent, appealed to the land court, and, as a consequence, suffered an addition of a hundred a year—an infliction which has now lasted for fifteen years—did not seem to me quite a Carringtonian episode. As an appeal to the landlords to accept the principle of a land court the idea was excellent. What, however, of the farmer? and, after all, in the Radical economy the tenant is the chief person to be considered. If, as a sequel to a land court, the tenant is going to have his rent raised—well, beshrew me, my lord, a land court will not have a fascinating guise to most of us. What if an Irish tenant had had his rent raised by a hundred pounds as a result of an appeal to the land court? Well, there would have been wigs on the Parliamentary green.

A Radical Threat.

In my capacity as a journalist I was the guest of Major Arthur Biggs—one of the sanest and present land reformers I know—at the National Liberal Club at the land reform dinner on Thursday. The speech of the evening was made by Mr. James Rowlands, M.P., the secretary of the Land Law Reform Association. Mr. Rowlands absolutely justified every assertion I have made as to the character of the Land Tenure Bill. He frankly hailed it as only a precursor, as a portent, as an omen. "I tell you," said he, "that the Land Tenure Bill is only the minimum of what we desire. We shall never again, if this measure be rejected by the House of Lords; be satisfied with anything short of the principles of the Scottish Bill being applied to England. We shall ask that the proposals of the Welsh Land Commission shall be applied in their essence, not merely to the Principality but to England. We shall demand that the most

MALTING BARLEY AND HOPS AT THE BREWERS' EXHIBITION.

The Growth of Malting Barley.

Cereals wears a golden crown this year, the result of a beautiful summer, and comes to us in nut-brown October costume, richly laden with the grain which from time immemorial has fed the brewing industry. In olden times October-brewed strong ales were in repute; but the arts of modern life have long since created the far-famed Burton beverage in our own country and the light Lager beer of the Continent. During the twenty-eight years the Brewers' Exhibition has had existence the evolution of this industry has brought revolutionary changes, and British farmers have acquired the knowledge how to grow most successfully the product which should invariably form the main element of the brew, prime malting barley.

Good Seed Essential.

Not until the Brewers' Exhibition demonstrated that some varieties of barley naturally produce plumper and finer skinned barleys than others, and that it is possible by rigorous, persistent selection to raise their quality to a high standard of perfection, were farmers in general impelled to recognise pedigree value in grain as well as in live stock.

Previously the acquirement of malting character was regarded as purely accidental due to seasons, weather, and soil influences. And there are still too many ordinary farmers who still cherish that delusion. To them one sort of barley for seeding purposes would be as good as another. But those who know regard the extra money expended in obtaining improved seed and corn as the best investment they could possibly make.

Crops and Manures.

Nor is this the only valuable lesson a study of the catalogue of the Brewers' Exhibition would give. Very wisely they contain information which every exhibitor is required to render with his entry as to the culture pursued, the crops it succeeded, the manure employed, and the period and character of the seedling. Every one of these conditions have direct or indirect influences on the barley yield, not only in respect to quantity, but quality.

The discovery was made by obtuse as well as intelligent farmers long since that, as a rule, better malting barley could be grown after a previous corn crop than after turnips, especially if sheep in feeding on the latter had left much more manure. Lands in good state of fertility, but not fresh manured, are found best for malting barley, and when some manuring is deemed essential, artificial fertilisers containing phosphates and potash with a very small proportion of nitrate are found better than rich farm-yard dung.

Time of Sowing.

Early sowing has been proved by the statistics of the Brewers' Exhibition catalogues to be very conducive to the successful growth of malting barley. In fact, the proofs recorded are too numerous for this point to be considered at all doubtful. Hence experienced cultivators seize on the very earliest period after the new year has opened, when weather and soil are both fitting for putting their crops in. Not infrequently lands are found in admirable condition in February, and sometimes still earlier, and experience, no less than the catalogue entries, prove the good policy of embracing such opportunities.

Too often those who have neglected to sow then find it impossible to get the like favourable conditions again until late in April. There are records in the catalogue of Chevalier barley having been raised successfully for exhibition purposes from November samples, but the winter four-wooded variety, the ancient name for which was Bere, is best suited for autumn seeding. Probably it was grown in this country for brewing more generally in old times than now. A strong, productive brown beer may be made, but its malt is not available for pale ale manufacture.

Threshing.

The fact that many a farmer spoils a good malting sample by bad threshing renders a word in season to be not out of place in advising very careful examination of the setting of the drum of the machine effecting the operation when it has commenced. The corns that are broken together with many others simply bruised are worthless for malting, so that it would save money in the end to go to the expense of making two threshings rather than spoil a good malting sample.

No doubt barley is the most difficult of all grain to thresh and prepare for marketing. Agricultural engineers have invented several admirable screens to facilitate the work and to enable those unaware of the services they render to know what ones are mostly made use of. Every exhibitor is required in filling up his entry form to state the kind of screen used for his barley.

Barley at the Brewers' Exhibition.

This department of the Brewers' Exhibition will not only be well worth inspecting during the present week, but will be so replete of object lessons for barley growers that a visit from country to town purposely to con them will be well worth while even by those farmers who are not exhibitors. When the difference in market value between malting and gringing barleys is considered, every occupier of land well adapted to grow the former ought to endeavour to his very utmost to learn all about the culture and conditions by which the best of the best have been grown.

The Barley Prizes.

The barley section of the Brewers' Exhibition, which opened on Saturday, is again well supported by British and foreign growers and merchants. This year there are submitted in competition 341 samples, of which 302 are home-grown and thirty-nine foreign, which exceeds the number of last year's entries by forty-six. The schedule this year shows nineteen different classes, and it may be noted that it is possible for the champion sample to be awarded six cups, two gold and other medals, several diplomas, and upwards of £100 in cash. Moreover, experience has proved that all samples which secure notice from the judges sell at far higher rates, and for this reason it is always advisable for entrants to state the exact stock they hold and the price at which they are agreeable to sell.

At the inaugural luncheon on Saturday Mr. Frank Flinn, the chairman of the barley judges, while expressing great satisfaction with the quality of the exhibits, again drew attention to serious faults in the way in which the barley was dressed. He pointed out that the machines were badly set, and that in consequence the ends of the corns get broken off, with the result that it is rendered unsuitable for the malting floor. He was convinced that this was not due to any defect in the machine itself, but entirely to the way in which it was operated. This year a class had been instituted for the best thrashed barley, with prizes of £4, £2, and £1, half the prize money to go to the man who fed the thrashing machine and half to the man who drove the engine. This, it was hoped, would bring about improvement in the way in which the barleys were dressed.

The following are the prizes as far as they were allotted on Saturday. The remainder, together with the winners of the MARK LANE EXPRESS Diplomas, will appear *in extenso* in our next issue.

The judges were: Frank Flinn, Maltster, Bishop's Stortford; James Grant, Manchester; Edward R. Hill, East Dereham; H. Mackeson, Hythe; Lewis J. Meakin, Burton-on-Trent; C. H. Stafford, Scarrington, near Nottingham; S. N. Thompson, Smethwick; C. Howard-Tripp, Esq., Burton-on-Trent and Romford.

PRIZE LIST.

THE WORLD'S CHAMPION PRIZE (Value £10 10s.).—Oxfordshire Barley (144): Mr. H. G. Hatt, The Vale, Ipsden, Wallingford.

THE "MARK LANE EXPRESS" CHALLENGE CUP.—Oxfordshire Barley (144): Mr. H. G. Hatt.

THE BURTON CHALLENGE CUP.—Oxfordshire Barley (144): Mr. H. G. Hatt.

THE J. K. KING AND SONS' 25 GUINEA CHALLENGE CUP.—Oxfordshire Barley (144): Mr. H. G. Hatt.

THE R. BORY, LTD., CHAMPION SCREEN PRIZE (£10).—Oxfordshire Barley (144): Mr. Hatt.

RESERVE FOR CHAMPION.—Essex Barley (47): Mr. C. M. Stunt, Belchamp Walter (entered by Mr. W. Cross, Colchester).

CLASS I. BRITISH MALTING BARLEY (CHEVALIER VARIETY).—1. Oxfordshire Barley (144): Mr. H. G. Hatt. 2. Essex Barley (17): Mr. C. M. Stunt, Belchamp Walter (entered by Mr. W. Cross, Colchester). 3. Suffolk Barley (205): Mr. H. J. Richey, Washbrook, Ipswich. R. Essex Barley (42): Messrs. Parish and Son, Kelvedon (entered by H. T. Eve and Co., Maldon).

CLASS 2. BRITISH MALTING BARLEY (GOLDTHORPE VARIETY).—1. Bucks Barley (242): Mr. W. Purser, Boveney Court Farm, near Windsor. 2. Hereford (253): Mr. F. Bonnor, Bollitree, Ross. 3. Hereford (255): Mr. J. J. Corbishley, Eccleswade Court, Ross. 4. Hereford (254): Mr. J. J. Corbishley, Eccleswade Court, Ross.

CLASS 3. COLONIAL MALTING BARLEY. (No entries.)

CLASS 4. FOREIGN MALTING BARLEY (Two Rowed).—1. Bohemian Barley (308): R. Liebmann and Co., 13, Southwark Street, S.E. 2. Austrian Barley (329): Prince Rudolf Lichtenstein, Kroman, Austria. 3. Hungarian Barley (334): S. and J. Reif, Vienna (entered by Woodley, Watney, and Richardson, 31–32, Crutched Friars, E.C.).

CLASS 5. FOREIGN MALTING BARLEY (Two Rowed).—1. Ouchac Barley (336): Messrs. Woodley, Watney, and Richardson. 2. Asiatic Turkey Barley (314): Messrs. J. Westrope and Co., High Street, Hull. 3. Ouchac Barley (312): Shaw, Son and Co., Ltd., High Street, Hull.

CLASS 6. FOREIGN MALTING BARLEY (Two Rowed).—2. Chilian Barley (337): Woodley, Watney, and Richardson.

CLASS 7. FOREIGN MALTING BARLEY (Other than 2 rowed).—1. Bohemian Barley (305): Liebmann Bros. 2. Bohemian Barley (306): Liebmann Bros. 3. Hungarian Barley (303): Liebmann Bros.

CLASS 8. FOREIGN MALTING BARLEY (Other than 2 rowed).—1. Smyrna Barley (338): Woodley, Watney, and Richardson. 2. Timisian Barley (323): J. Westrope and Co. 3. Smyrna Barley (313): Shaw, Son, and Co., Ltd.

CLASS 9. FOREIGN MALTING BARLEY (Other than 2 rowed).—1. Californian Barley (326): J. Westrope and Co. 2. Californian Barley (327): J. Westrope and Co. 3. Chilian Barley (341): Woodley, Watney, and Richardson.

The Hop Section.

The show of hops this year is very satisfactory, as regards both the number and quality of the exhibits. We have no less than seventy-three samples on view, the competing growers numbering forty-two. This is a considerable increase on the numbers of last year, and the average quality of the hops shown is an indication of the superior character of the English crop, as the judges testify that never since the competition has been established has there been so fine a selection submitted to their examination.

The list of entries gives the following details:—

- Class 1.—East Kent, twelve exhibits.
- Class 2.—Mid-Kent, six exhibits.
- Class 3.—East and Mid-Kent, seven exhibits.
- Class 4.—Wool of Kent, five exhibits.
- Class 5.—Wool of Kent, seven exhibits.
- Class 6.—Sussex, four exhibits.
- Class 7.—Sussex, four exhibits.
- Class 8.—Worcester and Hereford, eleven exhibits.
- Class 9.—Worcester and Hereford, seven exhibits.
- Class 10.—Farnham and country, five exhibits.
- Class 11.—Farnham and country, five exhibits.

It will be seen that every district is well represented, and we can well understand that the task set before the judges was not easy, when so many

excellent samples had to be compared. But we are informed that the following awards were arrived at with absolute unanimity.

The championship, with gold medal and diploma, goes to Mr. J. Thompson, The Hyde, Woolhope, Hereford, who is, therefore, also the winner of the special prize of £10 offered by Messrs. Sydney Myer and Co., Hereford. This is the first time that the championship has been gained by a Midland Counties grower, and we congratulate the fortunate winner on his well deserved success.

Class 1.—1st prize, No. 8, Goldings, G. Mount, Woolton Farm, Bekebourne; 2nd prize, No. 12, Goldings, Exors. of G. Whiteman, Tyler Hill, Canterbury; 3rd prize, No. 9, Goldings, S. Neame, Selling, Faversham.

Class 2.—1st prize, No. 18, Goldings, E. A. White, Ltd., Beltring, Paddock Wood; 2nd prize, No. 16, Goldings, W. Rogers, Horton, Kirby.

Class 3.—1st prize, No. 21, Bramblings, W. Lillywhite, Thainington Court, Canterbury; 2nd prize, No. 25, Cobbs, Exors. of G. Whiteman, Tyler Hill, Canterbury.

Class 4.—1st prize, No. 28, Cobbs, Ernest Mannington, Eaglesden, Benenden; 2nd prize, No. 26, Goldings, Exors. of W. Highwood, Marden.

Class 5.—1st prize, No. 34, Fuggles, Ernest Mannington, Eaglesden, Benenden; 2nd prize, No. 32, Goldings, J. D. Large, Taywell, Goudhurst.

Class 6.—1st prize, No. 39, Bramblings, C. Brissenden, Cousley Wood, Wadhurst.

Class 7.—1st prize, No. 42, Fuggles, E. Ballard and Son, Bartley Mill, Frant.

Class 8.—1st prize, No. 55, Bramblings, J. A. Thompson, Woolhope, Hereford; 2nd prize, No. 51, Mathons, W. F. Pudge, Bishops Frome, Worcester; 3rd prize, No. 46, Bramblings, F. O. Bomford, Leigh Sinton, Malvern.

Class 9.—1st prize, No. 59, Mathons, W. F. Pudge, Bishops Frome, Worcester; 2nd prize, No. 61, Bramblings, E. G. Shew, Bosbury, Ledbury.

Class 10.—1st prize, No. 67, Goldings, P. and C. Seward, Weston, Petersfield; 2nd prize, No. 64, Bramblings, G. W. Duncan, The Glade, Bentley.

Class 11.—1st prize, No. 73, Fuggles, P. and C. Seward, Weston, Petersfield.

The prizes offered by Messrs. Webb and Sons, Wodeley, to growers in the Southern districts are taken by Mr. S. Neame, Selling, and Mr. W. Lillywhite, Thainington, and in the Midland districts by Mr. J. A. Thompson, Woolhope, and Mr. E. G. Shew, Bosbury.

Messrs. E. A. White, Ltd., Beltring, offered prizes of £10, £5, and £3 for hops grown with the aid of "Spimo." These were awarded to Mr. G. Mount, Bekebourne, Mr. F. Pudge, Bishops Frome, and the executors of G. Whiteman Tyler Hill, in the order as named.

The Sheppy Glue and Chemical Works, Ltd., offered prizes of £10 and £5 for hops grown with their manure, and these were taken by Mr. G. Mount, Bekebourne, and the executors of Mr. G. Whiteman, Tyler Hill.

Not having had an opportunity of examining the exhibits in detail, we must postpone our criticisms concerning them till next week.

Blandford Barley Show.

Some dozen years since it was felt desirable amongst the agriculturists of Dorset to do something alike to improve the grain products of the country and at the same time direct attention to them from outside sources. This could not be done right away, but through the energies of Mr. J. E. Tord, of Dorchester, a most happy combination of the various Dorset farmers' clubs were brought about, and the first show was held at Dorchester. In many respects it was very crude, but it was highly representative of the barley and other grain as then grown in the county of Dorset. Barleys were high in the land and fairly reeking of the sheepfold enough to taint the beer brewed by them. They were very badly threshed and dressed, there being plenty of material left in for the top of the maltster's vat as well as in the bottom of it, the wheat was thin and horny, and contained plenty of clanners as well as other undesirables; whilst the oats were marvellous as regards the various shaped flints they contained.

That first show was an eye-opener as to what the market required and what it did not, and the entries have never been so numerous since, though improvement has to be recognised, still it comes somewhat tardily. Better threshing and far more attention to dressing is now the rule, whilst the old sheepfold barleys have vanished entirely. It seems a pity that prizes are not offered for seed barley. This would direct more attention to the show by the seedsmen, and thus better seed would be distributed in the country, and a few beans might be added. Are these not as useful to make the mare to go as the oats? It would take some of the mawbured ones to prove so effective. The barleys, as a whole, were fairly good, though the season had affected some of them very adversely. The wheats from

the strong lands of the Blandford district were very good indeed, especially the red wheats; nearly all were well grown, but some were shown out of condition. The oats were a very poor show. The judges were: for barley, Mr. W. Collis, Alresford, Hants, and J. E. Williams, Salisbury; for wheat and oats, Mr. J. Raymond, Poole, Dorset.

Class 1 was for the best exhibits of malting barley drawn from a bulk sample of 50 quarters. The first prize went to Mr. W. J. Foot, Stourpaine, with a very plump, very kind barley, with a nice curl and rather high coloured, which was grown on loam overlying a chalky loam, grown after wheat in 1905, and in 1904, the variety Carter's Prolific, seeded at the rate of 3½ bushels per acre on April 6 and harvested August 20 with a natural weight of 55 lb per bushel. The second went to Mr. C. Trowbridge, Imerne Minister, for a rather harder, more steely barley, and not so good in colour. It was grown on a chalky loam overlying chalk, after wheat following turnips, the variety being Hallett's Pedigree, seeded on February 24 and cut August 11, with a natural weight of 57 lb. The third went to Mr. F. C. Packard, Hamford. The commended card went to a rather two-coloured barley exhibited by Mr. M. N. Tord, Spettisbury.

The prize for the best threshed and dressed sample went to Mr. W. Hunt, Blandford St. Mary. It was beautifully turned out, but was much too high-coloured to be otherwise in the prize list. It was very unfortunate for Mr. J. Vye, White Cliff, that his barley was delivered after this class had been judged, else the awards might have been very considerably altered.

Class 2 was for the best exhibits of malting barley drawn from a bulk sample of 30 quarters. Here the entries were more than doubled. Mr. W. H. Hibberd, Canford Magna, was placed first and reserve for the championship of the show with a slightly stained, but otherwise very kindly barley, very plump and nice. It was grown on a sandy loam overlying gravel, after mangolds following turnips, rather an unusual preparation, the variety being Kinner Chevalier, seeded at the rate of 2½ bushels per acre on April 19, and cut on August 20, showing a natural weight of 50½ lb per bushel; second went to Mr. W. C. Marsh, Corfe Castle, for a very choice, nice colour barley, very bold and plump. Third went to Mr. G. Bissell, Affpiddle, for a very nice barley of two shades which was grown on gravel over chalk after roots following wheat, the variety being Webb's Chevalier seeded at 2½ bushels per acre on March 10. A commended card was given to Mr. W. J. Foot, Stourpaine.

Class 3 was for the best exhibits of malting barley drawn from a bulk sample of 20 qr. Here the first prize went to what was undoubtedly far and away the best sample of barley in the show. It was exceedingly kind, very plump, with a big red berry of good quality as the maltsters desire; subsequently it was given the championship of the show. In a measure this was due to the fine manner in which it was prepared, as to this sample was also awarded the first prize for threshing and dressing. It was grown on flinty chalk after oats following swedes, Hallett's pedigree being seeded at the rate of 3 bushels on January 30 and cut on August 7, the weight being 56 lb. to the bushel. Mr. N. H. Hibberd was awarded second, but for some unascertained reason was disqualified; third went to Mr. W. Hart, Shillington, and a commended card went to Mr. W. J. Spicer, Chettle, but his sample was too ripe and not dressed sufficiently.

The class for exhibits of white wheat drawn from a bulk sample of 25 qr. Here there were several very choice samples. Mr. J. Cossin's Tarrant Raunton was first with a very even, smart berry, in the best of condition; it was an ideal seed wheat. It was grown on loam and chalk after turnips, following ley. The variety, Ambrose Stand Up, seeded at the rate of 3 bushels on November 19, and cut on July 30; weight, 60 lb. to the bushel. It was awarded first prize for threshing and dressing, as well as the reserve championship. Second prize went to Mr. T. B. Sprake, Knowle Hill. Mr. J. Cassins was also placed third, whilst commended went to Mr. J. Lockyer, Wyke St. Giles.

The red wheat drawn from a bulk sample of 25 qr., constituted an exceptionally strong class indeed, Mr. J. Shepherd, Long Cribbel, headed the class with a magnificent sample of Imperial Standard. It was of that strong character millers desire, and it was clean, hard, dry, and perfectly dressed, but it had to yield to the white wheat in this respect, but it was so much superior in other respects that it was awarded the championship. It was grown on plint and chalk, after rape and turnips following turnips, was sown on November 4 and cut August 21, second went to Mr. T. B. Sprake, third went to the same exhibitor.

The oat class for best exhibit of spring oats drawn from a bulk sample of 25 qr. was a decidedly weak one as a whole, several of the oats being out of condition, first prize went to Mr. W. H. Stokes, Delcombe Farm; second prize to Lord Allington, Long Cribbel; and third prize to Mr. J. Nye,

Durlescombe Farm. The trade in the exchange was very fair, most of the offered lots being purchased at prices ranging from 26s. to 36s.

Method of Selecting Seed Barley.

Our illustration on the first page of this issue was reproduced from a photograph taken in a field of Mr. J. B. Sainsbury's (Whitecross, Ross) new Winter King two-rowed barley, and depicts him with assistants selecting the seed barley. Mr. Sainsbury claims for his new Winter King barley that it is the earliest two-rowed variety known, is a very heavy cropper, and a favourite with maltsters for colour and extract. It will stand any ordinary winter, and has been grown in Scotland with great success. The straw is very heavy, and stands better than most varieties. Mr. Sainsbury adds that clovers succeed better after Winter King barley than spring-sown on account of this variety's earliness, whilst one can obtain a green crop, turnip or mustard, after a crop of Winter King barley.

HOPS.

What is the Outlook?

Traders say there are rocks ahead, which growers will be well advised to be careful about, lest they find themselves stranded. What they mean is, that while brewers are now prepared to buy, their inclination in this direction will only last as long as prices are moderate. Their needs have not increased, and they will certainly cease to operate as soon as the firmness of growers has raised values above what they are disposed to pay. I hear that several of my country friends, who formerly held very exalted opinions as to the future of the market, have now modified their views, and have let some of their hops go at current prices.

I think they are wise in taking this course. Though it is not unlikely that we shall be able to secure a little more money, it will only be done by the exercise of great caution, and I am sure it is not safe to reckon upon the future with too much boldness. I heartily welcome the present revival of trade, which I am glad to believe is not the result of speculation, but of a legitimate consumptive demand. Growers should, therefore, deal with it wisely, they are not sending on ground that is actually and undoubtedly safe, as they have still before them the foreign supplies, which are coming forward, and will certainly continue to come forward in increasing quantity.

It is a very trying and teasing time for all concerned. Merchants will, I am sure, do their level best to uphold the market, as it is distinctly to their interest so to do. But they cannot resist the force of facts, and they know only too well that the brewers are the masters of the situation.

Produce of Hops.

Preliminary statement, showing the estimated total production of hops in the years 1906 and 1905, with the acreage and estimated average yield per statute acre in each county of England in which hops were grown:—

Foreign Hops

are being freely offered on our market at tempting prices. The value of Belgians has fallen considerably, and there is some pressure to sell them here at competitive rates. The German houses are very active in scouring the country. Their representatives are to be met everywhere, and although they are not booking many orders, their quotations hinder the business of English merchants. American hops of the new crop are also coming forward, quotations having recently been reduced. I have seen this week an offer of 500 bales of Oregon, the samples showing splendid quality. The price asked was 15½ cents per lb., free on rail on the Pacific Coast, representing about 85s. per cwt. in the English buyers' warehouses. I am also informed that a well-known American house, having an agency in London, is moving heaven and earth to place contracts with brewers for a series of years at about 84s.

SHOW GOSSIP.

A meeting of citizens and residents of Lincolnshire was held in the Guildhall, Lincoln, on the 12th inst., to promote the success of the Royal Agricultural Society's Show, which is to be held in Lincoln in June, 1907. The mayor presided, and he was supported by the Earl of Yarborough, Lord Monson, Lord Heneage, Sir Gilbert Greanial, and others. The mayor announced that there had been a liberal response to his request for donations. Already the promises amounted to very nearly £4,000. The Earl of Yarborough moved a resolution cordially welcoming the show to the city, and pledging the meeting to promote its success by every means in its power. The resolution was carried unanimously, as also was another that the meeting should form a general committee, with power to add to their number, for the purpose of giving effect to the former resolution.

At a public meeting held at Fakenham, it was unanimously resolved that steps be immediately taken to invite the Norfolk Agricultural Society to hold their show at Fakenham next year, and a committee was appointed to arrange matters. It may be mentioned that it is ten years since the Norfolk Show was last held at Fakenham, and as it then proved a success, the society will be sure to accept the invitation offered.

As was only to be expected, the wretched weather experienced by the Yorkshire Agricultural Society for their show at Middlesbrough caused a somewhat big financial loss. The report of the finance committee, which was presented at a meeting of the council last week, stated that the attendance of the public at the Middlesbrough Show was £2,722, being 7,229 less than at Hull in 1905, and 9,461 below the average for the last five years, and that a loss of over £700 had been incurred. The total receipts at the turnstiles, £2,362, and the grand stand, £374, together £2,736, were £438 less than at Hull, and £697 below the five years' average. The loss on the sale of timber, etc., used in the erections was 38½ per cent., or 8½ per cent. above that of last year, and 6½ per cent. above the average. The total fund amounted to the handsome sum of £1,621 gross, towards which the Middlesbrough Corporation contributed £250.

The Council requested the Finance Committee and the Stock Committee to consider and report to the next meeting of the council in December as to what reductions, if any, in the expenditure were possible. The question of the best means of obtaining an improved attendance at the shows, in order to ensure their financial success, was discussed, and it was resolved that in future the shows should be held on Saturday, which, being a general half-holiday, it was hoped would result in a larger gate, and they will in future commence on Thursday instead of Wednesday, the show at Barnsley next year being fixed for August 8, 9, and 10. A sum of £2,000 was voted for prizes at the show.

The last of the Westmorland cattle shows, known locally as the "Fellside Royal," took place at Dufton, near Appleby, on Wednesday in favourable weather. The exhibition differs from others in several ways. It is held in uncultivated ground on the village green, no charge is made for admission, and no printed catalogues are issued. The society derives its revenue solely from subscriptions and donations. The premium list is very comprehensive, and contains a class for unbroken Fell-going stags (i.e., young horses). At night a dance and waiting competition attracted country people from far and near.

Arrangements have been made by Mr. Frank Euren, who is the English secretary of the International Horse Show Society, to hold the first show at Olympia on June 7 and following days, 1907. The show will last for a week, and it will be run on the lines of those which are now held on the Continent and in America.

The following is the list of gentlemen who have been selected to act as judges of live stock at the Scottish National Fat Stock Club's Show, to be held in the Waverley Market, Edinburgh, on Wednesday and Thursday, December 5 and 6:—

Cattle: Shorthorns, Aberdeen-Angus, and cross-breeds: Messrs. James Durno, Jackson, Rothiemorran; George Cran, Morlich, Glenkindie; and John McKinnon, auctioneer, Blairgowrie. Gallows, Highlanders, and president's prizes: Messrs. Wm. McConnel, Glasnick, Kirkcovan; Arch. Turner, Kilehamag, Kintyre; and Duncan McLaren, Cornaton, Stirling. Butchers' cattle and dairy cows: Messrs. John Grisdale, Spittal's Farm, Kirkbythore, Berth; Thomas Lawrie, Windlestrawle, Edinburgh.

Sheep: Black-faced, Cheviot, and half-breeds: Messrs. A. M'G. Sprout, Baldoun, Wigtown; John S. Johnston, Crailing Hall, Jedburgh; and

James Wood, Eansett Hill, Gullane. Crosses and extra classes: Messrs. Wm. Cradock, Holenback, Maxwelltown; Wm. Martin, Dawyck Mill, Stobo; and John Shields, butcher, Alloa.

Pigs: John Brooks, Pinkhill, Corstorphine.

It has been felt for some time past by those interested in the Bristol Cattle Market that some movement should be made to popularise and add to the trade now carried on. During recent years the trade done at Bristol market has been falling into the hands more and more of the dealers, and farmers have not been supporting the market as they used to do in years gone by. One step decided on to make the market more popular is to hold a fat stock show in December, and so far £150 has been allotted in prizes, but if, as it is hoped, subscriptions comes in liberally, additions will be made to the prize schedule. The show will be open to competitors within a twenty miles' radius of Bristol, and judging from the present outlook it should prove a successful fixture. Mr. W. T. Howes, of the firm of G. Nichols, Howes, Co., Brow Street, Bristol, is the secretary.

At a special meeting of the Leicester Sheep Breeders' Association held at Driffield to consider a suggestion from the Royal Agricultural Society that a contribution should be made towards the class prizes for Leicesters at the next Royal Show, it was resolved to provide a class prize of £18, to be met partly from the society's funds and partly from voluntary subscriptions.

SHOW SECRETARIES.

Mr. HOWARD SAMMONS,
Oxfordshire Agricultural Society.

The meeting held in Banbury Town Hall to make arrangements for the visit of the Oxfordshire Agricultural Society next May, was very largely attended, and satisfactory progress was made, for a committee and also the secretaries were appointed, and a site—that used for the society's last show in this town—was selected. The Mayor read some of the details from the last balance-sheet at Banbury, in which it showed the total receipts to be £907 17s. 5d., and that the subscriptions locally came to £610. The town guaranteed £200 and provided special prizes and the band. That meant they had to pledge themselves to raise a similar amount this year. He hoped they would all aim at making the show a success. He thought if they raised about £600 they would do as well as before—or £650. As there is a balance in the bank of £250 from the last show the Oxfordshire Agricultural Society may rest assured that the requisite amount of subscriptions will be forthcoming, and we look forward to a most successful show in the cake town.

An interesting case to exhibitors at shows and show secretaries was heard by Sheriff Lee in the Arbroath Sheriff Court on Wednesday. It was the action of George Bean, a farmer, of West Balloch, by Montrose, against the president, standing committee, and secretary of the Angus Agricultural Association, as representing that association, for loss and damage incurred by the plaintiff in consequence, he alleged, of the defendants having illegally and unwarrantably refused to allow him to enter his mare, Queen Marcella, under the three-year-old filly class, and thereby deprived him of earning a prize in that particular class.

The defence was that the animal, having had a foal, was no longer entitled to be classed as a filly,

but was a brood mare, and accordingly fell to be entered under the brood mare section. The defendants contended that the claim, as stated, was irrelevant in respect that there was no definite statement showing how the actual loss had been sustained, and of consent of parties the claim was altered to the effect that, owing to the action of the defendants, the animal had been deprived of any chance of taking a prize in the filly section.

Witnesses for the plaintiff brought out that in other provincial shows, especially in the West of Scotland and in the Aberdeen Show, the practice of admitting three-year-old fillies with foals was dissimilar to that of the Angus Society; but, on the other hand, it was admitted that the custom of the Highland and Agricultural Society was in effect the same as that of the defenders.

The defence was that the Standing Committee of the society, in issuing their decision, had acted after careful investigation according to the best of their ability, and that, therefore, they were not liable in damages; further, that on the merits of the case the professional opinion and a large proportion of the lay opinion supported the decision of the Standing Committee, and that in any event the plaintiff was personally barred from insisting in his action through having accepted a commended ticket in the brood mare section for the animal in question, no animal being entitled to compete in two sections. A large number of witnesses from all over the country having been examined on both sides, the case was adjourned.

NOTES AND NEWS OF AGRICULTURAL SOCIETIES.

Dairy Shorthorn.

It was decided at the meeting of the council of the Dairy Shorthorn (Coates' Herd Book) Association, held at the Agricultural Hall, Islington, during the Dairy Show, to offer in 1907 the same number of prizes for pedigree Dairy Shorthorns as in 1906, with the exception that an increased amount be given to the Royal. The prizes offered will be as follows:—Royal Agricultural Society, £30; The Bath and West of England, £10; The Oxfordshire, £10; The Royal Dublin, £10; The Yorkshire, £10; The Royal Lancashire, £10; and The Tring, £10.

The conditions are:—(1) All cows and heifers competing in any class in which the association offers all or part of the prize money shall be cleanly milked out to the satisfaction of the stewards at 6 p.m. on the evening previous to the show; (2) On the first morning of the show all cows and heifers are to be milked in the ring in the presence of the judge, who shall also see each cow's milk weighed, and any animal that does not yield up to the association's standard, when milked in the ring, will not be awarded a prize; (3) No animal having been awarded one of The Dairy Shorthorn (Coates' Herd Book) Association's prizes, is eligible to compete for another of these prizes during the same year. The association's standard is as follows:—Cows, four years and upwards, not less than 25 lb. of milk; cows, three years old and under four, not less than 20 lb. of milk; heifers, under three years old, not less than 15 lb. of milk. These amounts apply to animals that have calved within three calendar months of the first day of the show; for those that have calved more than three months the quantity of milk is in each case 5 lb. less.

Hereford Herd Book.

An important resolution was carried almost unanimously at the last council meeting of the Hereford Herd Book Society, viz.:—That in view of the fact that the English Hereford Book has been closed since the year 1886 to any animal whose sire and dam had not been registered previous to that date, the council of the Hereford Herd Book Society, in the interests of the Hereford breed, invite and recommends the American Hereford Cattle Breeders' Association, the Argentine Rural Society, and the Uruguayan Rural Society, to alter their rules prohibiting the entry of English-bred Hereford cattle whose pedigrees do not trace to the 13th or previous volumes of the English Hereford Herd Book, and to accept the entry of any cattle which have been entered or are eligible for entry in the English Hereford Herd Book.

The President, in moving the resolution, said the question had been much discussed amongst Hereford breeders, and he thought a great majority of them would be in favour of it. Other remarks were to the effect that the present rule caused a great loss, as breeders had to be so careful in research as to the pedigrees of animals for breeding, and some new breeders had been disgusted on finding that important purchases were ineligible on one side or other of the pedigree. There was evidently a consensus of the meeting in favour of the terms of the resolution, and opinions were expressed that any animals entered in our Herd Book were quite good enough for acceptance by the foreign societies, considering that our Book

had been closed for twenty years against animals whose sire and dam had not been entered.

Devon County.

The Devon County Agricultural Association's Show at Tavistock in May was the largest ever held in the annals of the association, but the financial success was spoilt owing to heavy rain, and the takings were spoilt—£1,000 less than at Exeter in 1905. Still the increased entry fees produced more revenue, and the revised plan of shedding saved a considerable expense in the fitting of the showyard, so that there was no big loss, and the society's year finished with a good balance at the bank. These details were reported at the annual meeting on the 12th inst., when Lord Clinton was elected president for the ensuing year. The 1907 show will be held at Bideford on May 22 and 23.

Wadhurst.

The hill for the abolition of private slaughter-houses came in for severe criticism at the last meeting of the Wadhurst Farmers' Club. One member described it as "another bit of grand-motherly legislation," and another remarked that such a measure would mean another nail in the coffin of agriculturists, for the result of the Bill passing into law would force the retail butcher into the dead meat markets, to the great benefit of the foreign importer, as he would not be put to the inconvenience that might attach to the using of a public abattoir erected, it might be, miles from his shop. Eventually it was unanimously resolved, "That this meeting of the Wadhurst Farmer's Club pledges itself to do all in their power to oppose the Bill."

Exeter Horse Show.

That the Devon and Exeter Horse Society's Show at Exeter is a popular one was proved by the large attendance at this year's fixture, when the receipts—thanks to a fine day, a feature so seldom given the show—were £157 odd, as against £80 last year; but subscriptions do not come in as they should do, and at the annual meeting of the society on the 12th inst., Mr. M. B. Ford, one of the hon. secretaries, raised the question of whether or not the show should be continued. It seemed to him, he said, that unless they could find some means of obtaining subscriptions they should seriously consider whether the show should be held another year. Whether there should be a cessation he was not prepared to say. He was opposed to dropping the show, because it would be so difficult to restart it. They had worked all year at a loss of just over £20, instead of which they ought to have been adding to the money obtained in the year when they amalgamated with the County Association. There has been a falling-off of £30 in the subscription list, and another £30 in the entrance fees. He suggested that a subscription list should be opened, and that the success or otherwise of this venture be reported to an adjourned meeting. His remarks were supported by others, and one suggested opening a subscription list at once, but it was eventually decided not to publish a list until early next year.

Suffolk

The Suffolk Agricultural Association believes in no half measures when they issue a publication, as was evidenced by the ideal show programme and catalogue for their exhibition this year, and now they give further evidence by publishing their annual report for 1906 in pamphlet form. The idea is, of course, not a new one, but it is in the contents and arrangement that this pamphlet shows to advantage. A notable and new feature is the inclusion of the judges' reports on the stock and implements at this year's show, and the remarks of these experts cannot but prove useful to exhibitors. Another noteworthy feature is a copy of the illuminated address presented to the secretary, Mr. Robert Bond, in June, in recognition of his valuable services to the society. A full list of awards at the show is also given. The balance-sheet shows that the total receipts for the year were £1,143, a result comparing very satisfactorily with previous years, when the show has been held at Ipswich, viz., 1902, £3,809; 1897, £2,321; 1891, £2,132; 1888, £2,106. The expenses were—Prizes £1,581, working expenses £1,837, including bands, £63, military and naval sports £14, motor gymnasia, water display and tug-of-war £13, illuminations £26, sheep-dog trials £55, implement field trials £79. The profit on the Ipswich Show was £691, which now brings the total balance to the credit of the association up to £3,148.

British Dairy Farmers' Association.

The annual meeting of the British Dairy Farmers' Association was held at the Agricultural Hall, on Wednesday, Dairy Show week, the Marquis of Winchester presiding.

Mr. Cardick, in moving the adoption of the report, took the opportunity to refer to the deliberations of the Select Committee on Butter and Adulteration, remarking that the delay of the House of Commons in dealing with the matter

had been very keenly felt. He hoped the representatives of the agricultural industry in the House of Commons would use their best endeavours to see that early legislation was secured.

Mr. James Sadler (Crewe), who seconded the adoption of the report, complimented the council on what had been done on the present occasion to excite a greater interest in the milking of cows. The milking of cows had become an almost pre-judiced employment, and he did hope the association would continue to give every encouragement possible to the milking of dairy cows, because if there was not an ample supply of efficient milkers it would be impossible to carry on the dairy business. (Hear, hear.)

Sir Edward Strachey, M.P., who attended as the representative of the Board of Agriculture, remarked that formerly he had always been present as a member of the association, or latterly as a vice-president. Having asked the meeting to accept the apologies of the President of the Board of Agriculture, Lord Carmichael, who was attending a meeting of agriculturists in Scotland, Sir Edward said he might claim for the President of the Board of Agriculture that he had a very good record indeed. (Hear, hear.) In the past season not only was the fullest possible time given for the discussion of the Agricultural Estimates, but they were passed without a division. Two Bills which the Central Chamber of Agriculture had for years been pressing Parliament to pass—namely, the Fertilisers and Feeding Stuffs and the Dogs Bills had become Acts of Parliament. On the question of butter adulteration, several Bills had been introduced into the House of Commons, but had always met with the same fate. In the last Parliament, Mr. A. E. Fellowes said the adulteration of butter had increased to such an extent that it was necessary to appoint a Select Committee rather than bring in a Bill. Unfortunately, the late Government never appointed that committee, although it was promised to the Central Chamber of Agriculture. Immediately the present Government came into power they proceeded to the appointment of a Select Committee to inquire into the butter trade. That committee, consisting of men of different views, presented practically an unanimous report, the recommendations in which concerning the frauds perpetrated upon the public

would be embodied in a Bill. It was unwise to legislate in a hurry, and the President of the Board of Agriculture had said it was the intention of the Government to introduce a Butter Bill at the earliest possible moment, and it would be next session. There was enough work left over from last session to occupy the whole of the Autumn Session. (Applause.)

The President said he thought the statement of Sir Edward Strachey was very satisfactory to all of them.

Professor Long said members of a Government were generally antagonistic to the agricultural industry—(laughter)—but he was exceedingly glad that Sir Edward, though he had reached a Ministerial office, had been nothing of the kind. He should like Sir Edward to inform them when the earliest possible opportunity would be.

The Chairman said that would be placing Sir Edward Strachey in a hardly fair position; they must remember that the hon. member said that next session would be a hopeful time for introducing the Bill.

Lord Kenyon was chosen President.

Mr. Stapleton urged the Council to make representations to the War Office to include cow beef in their contract tenders, dairy farmers were suffering from the small demand for cow beef, which, in the case of fat cows, was more nutritious than that of bullocks.

Another member expressed the hope that something would be done to rebut the scurrilous attack upon the British dairy farmer that had been made in some of the London dailies, which among other things, alleged farmers persistently milked tuberculous cows.

Mr. Walker, on behalf of the West of England exhibitors of cheese, complained of the unfair manner in which it had been judged. The West of England cheeses exceeded the Scotch exhibits by more than two-thirds, and yet the two judges came from London and Scotland. The result was that the champion cheese at Frome Show was only commended, whilst the unnoticed cheeses there were brought right to the front.

Mr. J. T. Farmer (Devonshire) thought better prizes should be offered in the milking contests, otherwise they could not expect the competitors to bear the cost of going to London. (Hear, hear.)

Midland Notes.

OCTOBER, 1905, left the farming outlook better with us than it found it, and this October will do the same, yet what a difference between the two months. Last year we went about wrapped up in winter garments, for it was bitterly cold with a touch of north always in the wind, and nipping frosts each night. This year, without anything like a real St. Luke's summer, the month has kept for the most part unseasonably warm, so that, contrary to expectation, the leaves are remaining long upon the woodland trees, while autumn hatched insects are more plentiful than one expects at so advanced a date, and though the summer birds are going or gone, the bats have not retired yet to the winter quarters where they hibernate.

OCTOBER last year was a wet month, and this so far will be gratefully remembered for its rain; so far the two agree. But ploughing then was far forward, and pastures kept their greenness up to a late date in the season. One hears complaints, by the way, from farmers of heavy land that the recent rains have failed so far to penetrate the hard caked subsoil, and that the surface is in danger of becoming water-logged. Certainly the customary tramp of inspection round the farm has been a dirtier and more unpleasant business lately than one looks for as a rule after such moderate downpours as we have had, which looks as though the water was not soaking in as it should.

THE local root and grain shows which are now beginning to be held indicate that the downpours of the last few weeks have brought along the mangol crops very rapidly, and that on the heavier soils a much more bountiful harvest will be gathered than seemed probable a month ago. The Colehill show yesterday was interesting as marking the jubilee of the local Farmers' Club, and attracted some well-known visitors in the persons of Sir P. A. Muntz, M.P., the Hon. Arden Adderley, and Dr. Wall.

A FALLING-OFF in dairy produce at this Warwickshire fixture was accounted for by the suggestion that dairying is occupying less attention than hitherto in this district. If that be so, the Colehill neighbourhood is rather an exception—the tendency as a rule is all the other way—and the more rapidly as the advantages of combination become more fully recognised.

THAT, of course, is happening now in many quarters. During the period of extreme milk scarcity the contrast between the prices paid to producers who were protected by an association and those who enjoyed no such assistance was too remarkable to escape comment, and the lesson is being turned to account. The Water Orton Association is the most recently formed; and then the same movement has borne fruit at Tamworth, and the Leicestershire producers are also organising. In the end it is hoped so to organise the trade that all the milk which goes to Birmingham—the greatest centre of consumption—shall realise a fair standard price. That ideal is far off yet, but recent developments do something to bring it nearer.

MEANWHILE the new contracts promise to be more remunerative than the old. An interesting case in point is furnished by the Tame and Rea Drainage Board contracts in respect of the new sold off their enormous sewage farm. In this instance, the price obtained for the first nine months' milk represents an increase of a farthing a gallon on last year's rates, and that for the remaining three months an increase of a halfpenny. The Board agrees to supply 150 to 180 gallons a day at these rates.

ONE is sorry to see the school-attendance and hop-picking trouble cropping up again. This week the batch of parents and guardians summoned to Brierly Hill police-court was only eighty-six, which means that the prosecutions this year are less than they were a year ago; but it is a pity there should be any. The hop-picking exodus is so regular a thing in some parts of the Black Country that it is much to be regretted educational authorities cannot see their way to arranging holidays so as to fit in with it.

THE returns of animal diseases are not altogether pleasant reading. Having taken the trouble to look back over the official figures, I find ten Midland counties have furnished sixty-five cases of swine fever since the beginning of July. Staffordshire heads the list with fourteen, but Salop with thirteen and Warwick with ten are not far behind, while Worcester and Gloucester account for seven apiece. When the year's statistics come to be made up, it seems hardly likely that any further progress in stamping out this disorder will be shown; on the contrary, we seem to be "advancing backwards"; and meanwhile we must expect the Board's new policy of grouping together the Swine Movement Order areas to hang fire.

October 18, 1906.

CORRESPONDENCE.

Lime Properties in Soil.

SIR,—For some time past the question of the exhaustion of the lime properties in our English soil has been freely ventilated in the public press as having an important bearing on the farming interest, and more especially on the augmenting or decrease of our crops in proportion to its absence or presence. Will you kindly allow me a little of your valuable space to make a few remarks and recommendations that will be interesting and valuable to farmers.

Having this year grown some wheat from pulverised limestone without any soil or any addition whatever that will compare favourably with any farmer's sample, and also a great improvement in the bulk and quality of the straw (more particularly in its power of resisting adverse weather), it must of necessity follow that this will eventually be a great consideration in matters connected with farming, and also to what extent it will pay a farmer to invest his capital in pulverised limestone in preference to artificial manures that only last one year and leave the land in a worse condition than it was previous to their application.

As clover contains a large amount of pure lime, it is impossible to grow a crop if it is not in the land, but by a liberal application it can be grown on any land, and as clover ought to enter largely into the rearing of all young stock it will be seen what an important item this is on all farms, to

great measure to condition of soil and climate which do not exist here; now M. Jules Méline throws fresh light on the state of affairs in France.

France also has a rural depopulation problem to face, and M. Méline, ex-Premier and ex-Minister of Commerce and Agriculture, discusses it in his "Return to the Land," a copy of which has just reached me. Some of the figures he gives are curiously instructive. In 1862, he tells us, there were 1,134,000 peasant proprietors in the country; by 1882 the number had fallen to 727,000; and in 1902 there were but 589,000. The chief cause of the agricultural depression which induced this remarkable decline was removed, he adds, when the Government consented to place farming on an equality with commerce by means of a protective tariff.

That is a statement worth remembering. Has Earl Carrington, one wonders, considered his fellow Minister of Agriculture's experiences?—
Yours faithfully,
October 19, 1906.

READER.

The Change in the Farming Class.

SIR,—The grass fields are green all over the Northern Counties of Scotland, and there will be a heavy crop of roots for sheep and cattle feeding, so that the price of both cattle and sheep is high, and store cattle and lambs and old ewes for stock are

WHEAT (exact size). GROWN BY Mr. HAWTHORN.

say nothing of the mechanical benefit derived as the land can be ploughed with one horse less after its application.

I am afraid of trespassing too much on your space, or I could give further evidence if you think it desirable.

I am, Sir, your obedient servant,
GEO. HAWTHORN.
Small Heath, Birmingham.

The Small Holdings Panacea.

SIR,—Now that small holdings—thanks in large measure to Earl Carrington—are much in the air, one meets many people who point in triumph to Belgium and France as shining examples of what can be done in that way. Some years ago Lawes and Gilbert in the R.A.S.E. Journal showed that the success of the Belgian holdings was due in

three times the price they were thirty-five to forty years ago. Thus our Scotch Highland farmers give up driving about the country in their old style of trap and dog cart, and now use only motor-cars, and are appealing to Parliament to get their farms reduced in rents. I and my father belong to a family that has farmed for the last 800 years in Ross-shire, and we paid £2 per imperial acre for land that our forefathers cultivated from waste land, and this same land is now let to others at 20s. per acre. Further, the prices of sheep and cattle, butter and eggs are now three times the money we used to get, and yet we lived well and happy with contentment, with natural affection and brotherly love. The old have passed away and died happy, but have left a cold race behind void of natural affection, with only the love of this world and thirsting after its vanities.

October 17, 1906.

INVERNESS.

Insect and Fungus Pests.

SIR,—I quite agree with "Sevenside" that nothing will ever be done to effectually deal with insect pests without combination of effort, but, except in a few cases, I think one might as well expect our Board of Agriculture to spend money on fighting these troublesome foes. "Sevenside" asks if sheep dipping is to be required of us by law, why not fruit washing? Just so, and much as I agree with "Sevenside" as to the desirability of making it compulsory to keep fruit trees clean, I can see many difficulties in the way. As a matter of fact, we do not treat our fruit growing seriously enough, and the slipshod way in which it has been carried on for years has allowed the foreigner to get a foothold in our markets which is firm and lasting. "Sevenside" quotes the ease of California as an example. Quote so, but in California fruit growing is treated as a business and an industry, not a mere happen and chance adjunct to ordinary farming.

I need not tell "Sevenside" that there are scores, yea hundreds, of orchards in the West of England that are crowded with old and insect-ridden trees that are living examples of years of unpardonable neglect. "Sevenside" knows all this as well as I do, and supposing a law were passed making it compulsory to keep fruit trees clean, who would the task of dealing with these old specimens fall on? It would certainly be too great a job for either landlord or tenant without State aid, and the object of it would only be to prevent the pests spreading to young trees, because there are hundreds of old specimens growing in orchards that are not worth spending a penny on. We have let things go in that delightfully philosophical way of ours, while foreigners have been raising orchards and treating fruit culture on sound business lines, and now it is difficult to know which way to turn for the best. Last season I had reason to complain about some newly-purchased trees having American blight on them. The tradesman apologised and pointed to an old blight ridden orchard just outside his boundary as the cause. He spends pounds every year in keeping his stock free from the pests that are bred in the old orchard and has no jurisdiction. Of course he ought to have, but in the words of Hodge, this is only one of the things that "don't seem tight to me." Oh! if we were only just starting orchard fruit-culture instead of patching up something that has been allowed to go down almost to decay, how differently we might act! I sympathise with "Sevenside" and agree with the principles of his arguments, but I much fear that the remedy he suggests will not come in his time or mine.

October 18, 1906.

WEST COUNTRYMAN.

Sales of English Wheat.

SIR,—I cannot help writing you a line to say how astonished I am to see in your MARK LANE EXPRESS of last week that the returns from the statute towns of the quarters of wheat sold in September of this year are 15,400 qr. less than in September, 1905, namely, 400,000 last September, 1906, and 465,000 in September, 1905, or 14,000 qr. a month less this year than last in the corresponding period, consequently a very fair comparison. These figures do not quite go to confirm the estimated crop of wheat returned by so many, several returning them from 100 up to 105, but rather confirm my view, that the crop was rather under than over average, and especially when you consider what a fine month the whole of September was for threshing.—Yours truly,
Devizes, October 12, 1906.

Wm. FOOKES.

A Famous Jumping Mare.

SIR,—The mare Fanny Drape was at one time in my possession, and my object in troubling you with this letter is to correct "Looker-On" in two or three of his remarks on which his memory appears to have failed him. The said mare was from a half-bred mare, and got by A British Yeoman by Liverpool, dam Fancy by Osmond, &c. At the Royal Show, at Manchester in 1888, she was ridden by a brother of her owner, the late Mr. Casson. The late Mr. E. Mulcaster rode her on several occasions, but she was never—in my recollection—ridden by Mr. Geo. Mulcaster. In colour she was a sound black, and a good specimen of a 14 stone Hunter, having strong limbs, bloody quarters, big thighs, and clean hocks. Through her I claim to have owned, trained, and ridden the winner of the first jumping prize in England, which was given by the Brampton Agricultural Society in the year 1897. I have seen two or three horses in my time that could jump higher, but none a greater distance; in a trial jump over water she once covered 28 feet, measured.—I am, yours faithfully,
Jno. P. LAW.

Croft House, Brampton, Cumberland.

SIR,—"Looker-On" in MARK LANE EXPRESS, October 8, says he has forgotten Mr. Duell's Cleveland mare Star's breeding. She was by Barnaby XVIII., dam by Master William II., dam by

Hamilton Hero. I have driven her in harness sixty years since. Star was bred at Low Borrowby, near Hinderswell. The other mares were bred at Plumtree House, Staithes. Water 'umps were just coming into fashion at that time; now they are mostly done away with. Star was not trained to jump water, though she won two good prizes at Scarborough first time she was tried in 1873, and several times at Eston over water and timber. Pretty Polly in the Cleveland book has never been beaten. She is of the same strain as Star.

ANOTHER LOOKER ON.

SIR,—I wish to contradict the statement made by "The Looker-On" in the MARK LANE EXPRESS, as to the breeding of Fanny Drape, the famous Cumberland jumping mare. He says she was by a Cleveland bay horse and from a thoroughbred mare, which is not correct.

She was by a thoroughbred horse called A British Yeoman, and he was by a horse called Liverpool.

She was from a half-bred mare got by a horse called Galser, and bred by a gentleman named Isaac Drape, of Abbey Town, near Silloth, near Cumberland, and was sold to Joseph Casson, of Burgh-by-Sands, Carlisle, who owned her when she met with the fatal accident.—I am, yours,
BURGH SIDER.

Liverpool, October 16, 1906.

The Importation of Canadian Stores.

SIR,—A letter appeared in the MARK LANE EXPRESS of October 8 advocating the importation of store cattle into the United Kingdom. If this be allowed, another nail will be driven into the coffin of British agriculture, will ruin the cattle raising industry of this country, and it is doubtful if any advantage to beef-producers would accrue from it, because imported meat beasts would then invade our markets, be slaughtered in every town, and would much more pertinently compete with home-fed beef than imported dead meat does now.

The whole system of importation may be summed up by the following few words:—

Free imports naturally benefit a man as a consumer, but injure him equally as a producer.—
Yours truly,
October 16, 1906. A. J. R.

PUBLICATIONS RECEIVED.

The October number of the Madresfield Agricultural Club's Quarterly is distinctly a show number, for the major portion of its pages are devoted to the society's shows held in August, but there are other interesting items, and, like its immediate predecessors, this new number of the Quarterly is a credit to its compilers and also to the club.

The Calendar of the West of Scotland Agricultural College, Glasgow, for the session 1906-1907 has recently been issued in the form of a small book well bound. It gives full information of the college and the work carried on there, which to intending students and also present students cannot fail to be of the greatest service.

The new volume (number XLII) of the Kent or Romney Marsh Flock Book bears eloquent testimony to the increasing popularity of the good work of the Kent and Romney Marsh Sheep Breeders' Association, for the contents in each of its sections is larger than in any previous volume. It gives details of rams nos. 16,196 to 18,020, ewes 249 to 384, and flocks 1 to 114, whilst other items of interest to breeders of Kentish sheep are included. Copies can be had on application to the secretary, Mr. W. W. Chapman, Room 4, Mowbray House, Norfolk Street, Strand, W.C.

"A Dissertation upon Guns and Shooting," by Edgar Harrison, provides interesting reading for the sportsman, but its chief feature is perhaps its general introduction to the art of shooting for those who have not yet succumbed to the fascination of the gun. It gives many a useful hint, and is altogether a welcome addition to the sporting library. It is published at 5s. net by Messrs. Cogswell & Harrison, Ltd., 226, Strand, W.C., and 141, New Bond Street, W.

"Book-Keeping Down to Date," by A. Munro, Larbert, N.B., although only issued in September of last year, has now run into a third edition. It merits its success, for it is written by one who knows his subject, is an exhaustive treatise, and is cheap. It is published at 2s. 6d. net by Effingham Wilson, 54, Threadneedle Street, E.C.

After having been in turn a monthly, a quarterly, and issued as circumstances permitted, Messrs.

Bibby and Sons' publication now makes its appearance under the title of "Bibby's Annual," and it should prove one of the most popular of annuals, particularly to all who take an interest in matters agricultural. It has been enlarged, and good as have been other issues, we doubt if the present has ever been excelled, for the illustrations are of the very highest quality—quite gems of the printer's art—whilst the reading matter is most varied and interesting. A feature is made of coloured pictures, and these are most commendable; in fact, the annual is an excellent shillings-worth, no matter from what point of view you look at it.

Messrs. Webb and Sons, of Wordsley, Stourbridge, have issued a catalogue of new and improved cereals for the season 1906-7, which contains details and illustrations of their new and improved varieties which have been so extraordinarily successful during the past season, and have secured many high awards.

Lincolnshire Farmers' Union.

The monthly meeting of the Central Committee of the Lincolnshire Farmers' Union will take place on Friday next.

During the month meetings have been held as follows:—October 1, Sleaford and Heckington; October 2, Barnetby; October 3, Newark and Ruskington; October 4, Billinghay; October 5, Stamford; October 6, Retford; October 10, Rolleston; October 19, Gisherton; and for future—October 22, Waddington; October 25, Brant Broughton; October 26, Hykeham.

James Musty, a groom at St. Fagans Stud Farm, was summoned at Cardiff, on Thursday for "gingering" a horse at the Cardiff Horse Show on September 19, and James Rees was summoned for aiding and abetting him, but both gave an emphatic denial to the charge. The deputy stipendiary said that he feared the practice of "gingering" was very prevalent at shows, and persons found guilty of the offence in that court would be severely punished. He would, however, dismiss the present case, giving the defendants the benefit of the doubt, and remitting the costs of the prosecution.

The BRITISH OIL & CAKE MILLS, Ltd.

Offices—Cleveland Street, HULL.

Manufacturers of:—

"B.O.C.M." PURE LINSEED CAKE

"B.O.C.M." PURE COTTONSEED CAKE

"B.O.C.M." COMPOUND FEED CAKE

"B.O.C.M." COMPOUND FEEDING MEALS

Pure Linseed and Refined Cottonseed Oil.

The brands of the British Oil and Cake Mills, Ltd., are a guarantee of the purity and high quality of their different products.

The old brands of the Company, viz.: "E. R.," "Stephens," and "W. H. & W.," are still available to any customers who prefer them.

Sold by Cake Merchants and Dealers.

WE MAKE GUNS

We sell to the user with only one small profit.
We sell for cash direct to the user.
We buy the finest materials to be obtained.
We pay cash for all materials.
We employ some of the finest workmen in the Gun Trade.

We use finest machinery for machine operations.

RESULT.

We sell for £25 Guns of a quality for which sportsmen have previously paid from £50 to £80.

We sell thoroughly reliable Guns.

We got the finest shooting it is possible for guns to make.

Our "Field" Hammerless Ejector Gun—A perfect Ejector Gun of the finest quality, £25.—It made with the best single trigger mechanism ever invented, £30. A perfect pair of these Guns, beautifully matched, £50. A perfect pair of Single Trigger Guns, £60.

"The Gun of the Future," as an Ejector, £15. "The Gun of the Future," without Ejector, £10. A sound and reliable gun, well made, and perfectly balanced, which will give entire satisfaction.

Pattern 8662, £6.—A sound and reliable hard shooting and hard wearing hammerless gun. Better than many sold at double the price.

Pattern 8358, £4.—A sound and reliable hard shooting and hard wearing hammer gun. Better than many sold at double the price.

ESTABLISHED 20 YEARS.

Bankers: London and Midland Bank, Temple Row, Birmingham.

MIDLAND GUN CO.

Demon Gun Works,

PRICE STREET, BIRMINGHAM.

Northern Notes.

THE ram sales are over in the north, and farmers are now settling down to their autumn and winter occupations, with a day or two of hunting to sweeten the routine of farm life. The turnip flats are already invaded by the young flocks, and these afford most bounteous feed. In Yorkshire the lambs are being put on roots, with a supply of sweet hay available in sheep racks within the fold, a method which counteracts the scouring effect of a green crop. There is always a percentage of mortality amongst lambs at this season, but we are not cognisant of any excess this far.

GRASS is now abundant in the pastures wherever they were not overstocked, and cattle and sheep are able to obtain a good bite, though it is obvious that at this time of year grass does not contain the highly succulent properties which it possesses in spring and summer, and especially needs supplementing in the case of horses. Sheep and lambs are at the present time being folded in comfortable circumstances; the weather, so far, has been comparatively mild, although we have had reminders of an approaching and probably violent change by the announcement that the highest of our hills have already had a slight coating of snow.

WE are all more or less familiar with the ever-increasing expense of poor-law administration and one is inclined to the opinion that guardians do not exercise so strict a supervision as they might do in the matter of incidentals. We have a workhouse in our mind's eye at the present moment, the front of which might readily be taken for some person's worldly mansion, so gorgeous is it with beds of flowers, rustic seats, and other ornamental devices, including a large hothouse on one side. Such institutions, with their grand fronts and lavish ornamentation which the poor inmates seldom see and do not appreciate, cost a deal of money to maintain, and we contend the money would be spent much more sensibly in providing comforts for the aged inmates. Expenses grow bigger, notwithstanding that inmates do not increase proportionately.

A CORRESPONDENT quotes a striking instance of what has happened in a small parish in North Yorkshire in connection with poor-law and highway expenditure, and he draws a comparison between the amount raised now and forty years back. For the three years ending March 31, 1866, the aggregate amount drawn from the ratepayers was £441 6s. 3d., whilst for the three years ending March 31, 1906, it is £258. In addition, the Government now gives a grant on country roads and also on the pay of police. In considering the increase in this particular parish, which amounts to a rate of 4d. in the £, allowance must also be made for the Agricultural Rating Act, which, coming into operation in 1896, relieved the occupiers of land of half the rates levied in respect of their holdings. But for that it is impossible to say what the increase in the rates of this little North Yorkshire parish would now amount to.

THE conference of farmers associated with the North-Eastern Agricultural Federation, held in Newcastle last Saturday, must have given a great fillip to those present and to thousands who will read an account of the proceedings. The federation is yet in its infancy, but it has already made its influence felt, and its future usefulness, under a strong executive, is fully assured. The federation had an interesting report to present, and a no less suggestive agenda to consider.

ONE of the most important matters mentioned was that relating to the representation of the agricultural interest on electoral bodies. True the landlords, as representative of agriculture, are returned in large numbers to our county councils, but not all of them are practical men, and the tenant-farmers are the people who must be run as candidates wherever their interests lie. "Organised agricultural opinion has given to agriculture," the report said, "the oldest and still the greatest of all industries, something like the same degree of attention and consideration which Governments of the day extend to the better organized industries." The resolution relating to land tenure was practically a declaration in support of the Bill dealing with the subject, a plea for more freedom in the management of holdings. Farmers, it is rightly claimed, should have more liberty in dealing with ground game, in cropping, and in the disposal of produce. They should, in fact, have the utmost freedom, compatible with due regard to the rights of landowners, in deciding how they shall most effectively employ their capital.

"HOW is it that you allow the Danes to get a couple of millions out of us every year when you could put the money into your own pockets?" This question was addressed by a

MOST EASTERLY NURSERY

As a FENCING EXPERT and GROWER of no small reputation, I should like to arrest your attention for a few minutes, provided you are requiring a fence of some description. I have an enormous stock of HEDGING PLANTS of all sorts, grown on my Nurseries, of England's Bleakest Coast, which are open to every wind which blows, with a consequence that my large and varied stock is as hardy as it can be and will thrive anywhere. A DESCRIPTIVE PAMPHLET, containing CULTURAL DIRECTIONS for HEDGING and

description of Myrobellia, free. MYROBELIA (from fencing), the wonder of the age, still unrivalled for quickness of growth. It makes a close, thorny — i.e., impenetrable fence — and is non-injurious to stock. 1½-2 ft., 5/- 100, 30/- 1,000; 2-3 ft., 7/6 100, 50/- 1,000; 3-4 ft., 10/- 100, 70/- 1,000. PRIVET (Common), 1-1½ ft., 5/- 100, 35/- 1,000; 2-3 ft. 8/- 100, 55/- 1,000. PRIVET OVARY, 1-1½ ft., 6/- 100, 45/- 1,000; 1½-2 ft., 10/- 100, 70/- 1,000; 2-3 ft., 15/- 100, 100/- 1,000. QUICKTHORN, 1-1½ ft., 3/6 100, 25/- 1,000; 1½ ft., 5/- 100, 35/- 1,000; 2 ft., 7/6 100, 50/- 1,000. LAURELS, BEECH, HOLLY, YEW, &c., in all sizes, prices on application. STARTLING OFFER! — I will pay carriage on all 5/- and larger orders to your nearest station. Distance or weight is no object. Send for Catalogue of FOREST, FRUIT TREES, SHRUBS, ROSES, PLANTS, BULBS, &c.; all sorts and any quantity supplied.

Publishing Offices: 3, Wellington St., Strand, London.

Leeds doctor to an audience of the Yorkshire Dairy Farmers' Association. It is a plain question, and one to which a straightforward answer might be given: "Because we do not sufficiently co-operate." Co-operation ought not only to be the watchword of farmers, but of milk-producers as well. Dairy farmers at present hold the field against the foreigner, but there is no guarantee that he will do so for long.

THE pasteurisation of milk may open up a vista of hopefulness to our Continental dairymen, and we may in the near future have our milk shipped from Denmark and other places in bottles. The argument in favour of the foreigner is that if milk can be sent a long distance, and still be fit for consumption, the foreigner has his opportunity. The preference given by railway companies to foreign produce in bulk would place the importer in a favourable position as a competitor in large centres of population; and if we desire to keep abreast of all possible competition there is one way only of achieving that desire, and it is by a well-defined system of helping one another.

FEDERATIONS may do something towards bettering the position of agriculturists and dairy farmers. Federation only touches the fringe of the whole matter; there must be active co-operation on a large scale following on the heels of this farmers' "Parliament" just held in the north. October 19, 1906.

POULTRY.

Poultry Exhibition in Moscow.

The Board of Agriculture and Fisheries are informed by the Russian Embassy through the Foreign Office that an exhibition of poultry will be held at Moscow in November next by the Russian Poultry Society. The exhibition, which will include an international section, will be open from November 29 to December 4.

Good Prices Expected for Christmas Turkeys.

It is a somewhat ungrateful task to recommend any venture in breeding, for before the time when the stock bred can be placed upon the market plenty of disturbing events may occur. None the less, there are periods when inferences may be drawn some weeks, and some months, beforehand.

At the present moment, when so many farmers are debating whether or no they shall fatten turkeys for the Christmas market, it may be worth noting that the season in Ireland, whence much of the competition comes, has been singularly unfavourable.

It is held by good judges that at the best Ireland next December will be able to send only a moiety of last year's supply. France has not had so bad a period for the young birds; nevertheless, both in Britanny and Normandy, which are the chief provinces upon which we draw, the mortality has been very great, and 75 per cent. of last December's surplus for shipment to England is the anticipation.

In these circumstances farmers in the approaching season ought to get a price compatible with profit. Russia is an unknown factor in the matter, but the quality of Russian turkeys does not come so near to English as does that of French and Irish birds. And, apart from natural quality, the journey, of course, is considerably longer.

Corn Crushing by Tramps.—Recognising the unprofitable nature of stone pounding as a task for tramps, the East Preston (Sussex) Board of Guardians have decided to set their casual visitors to work at corn crushing instead. In former years the tramps who frequented this workhouse used to crush a good deal of corn, the board making a charge of a penny a bushel for the crushing, but the practice was eventually dropped in favour of stone pounding, owing to the difficulty of getting sufficient corn to crush.

Farmers and German Gipsies.—The German gipsies, who have been wandering in the Midlands and North of England for several months past, are still being driven from pillar to post. Upon arriving at Ampleforth, a village in the North Riding of Yorkshire, they encamped as usual for the night. Next morning a number of villagers and farmers in the locality met together, some armed with sticks, and others with guns, and proceeded to the camp. On arrival they gave the gipsies summary notice to quit, but were quickly told in reply that the gipsies intended to remain that day. To show their determination not to be driven away, the gipsies also armed themselves with sticks and axes. One gipsy raised an axe, and was about to make a rush at a man, saying he would strike him down, when a farmer shouldered his gun, and told the gipsy if he stirred an inch he would blow his brains out. Evidently impressed, the king of the gipsies gave orders to drop arms and clear out, and this the whole band did, not forgetting to wrap their maledictions on the villagers and farmers.

Works cover Six Acres

Fertilisers and Feeding Stuffs.

USEFUL INFORMATION FOR FARMERS WHEN BUYING.

Approximate Unit Cost of Fertilising Constituents.

It is necessary for guidance in the economical use of fertilisers, and especially in the purchase of Complete and Special Manures, that the relative unit cost of the principal fertilising constituents should be studied: the subjoined table affords information on the subject. By multiplying the guaranteed minimum percentages of a fertiliser by the unit costs given in the table, the buyer will get a good idea of the commercial value of any chemical manure offered to him. The unit values are subject to variations from time to time, and in this respect we shall endeavour to keep the table up to date, besides which, buyers living in remote districts may have to pay a little more for heavier cost of delivery. If credit is required, this will also add to the cost.

	Peruvian Guano.			Nitrate of Soda.	Sulphate of Ammonia.	Bone Meal.	Superphosphate.	Basic Slag.	Bone Com-pounds.	Special Man-ures.	Kainit.	Sulphate of Potash.	Muriate of Potash.
	Raw or Equa-lised.	Phos-phatic.	Dis-solved (sol-uble).										
Ammonia, organic as in Guano and Bones	s. d. 15 0	s. d. 12 6	s. d. 15 0	s. d. —	s. d. 10 0	s. d. 12 6	s. d. —	s. d. —	s. d. 15 0	s. d. 12 6	s. d. —	s. d. —	s. d. —
" in Sulphate of Ammonia ...	—	—	—	—	10 0	12 6	—	—	15 0	12 6	—	—	—
" calculated from Nitrogen in Nitrate of Soda ...	—	—	—	12 0	—	—	—	—	—	—	—	—	—
Phosphate soluble in water ...	2 0	—	2 0	—	—	—	1/10-2/3	—	2 0	2 0	—	—	—
" assimilable ...	1 3	1 2	1 3	—	—	1 2	—	—	1 3	1 3	—	—	—
" insoluble ...	—	—	—	—	—	—	—	1 3	—	—	—	—	—
Potash (pure) ...	4 0	4 0	4 0	—	—	—	—	—	4 0	—	3 10	4 0	3 10

N.B.—The above table is based on the commercial cost of the fertilising constituents. Agricultural value is not always synonymous with the commercial cost, and every farmer must exercise his judgment, while considering the cost, which fertiliser may be expected to give the most profitable return on his soil and for his crops. This is the cheapest manure for him.

Approximate Unit Cost of the Nutritive Constituents in Feeding Cakes and Meals.

June, 1906.

Cakes and other Feeding Stuffs.—In order to be able to form a correct opinion of their value, it is necessary to know the relative cost of the different nutritive constituents. The following note, by an eminent authority, supplies this information. By reference to it, a farmer can calculate out the approximate commercial value of a cake or meal, and then use his judgment as to which is most suitable for his special requirements.

	s. d.	s. d.
Albuminoids ...	2 8	3 0
Oil or fat ...	2 8	3 0
Carbohydrates ...	1 1	1 2

NOTE.—Most authorities in England are agreed that the value of each per cent. of unit of albuminoids and of oil is at least 2½ times that of 1 per cent. of unit carbohydrates. If, therefore, the percentages of albuminoids and oil in a feeding stuff be respectively multiplied by 2½ and added to the percentage of carbohydrates, the total feeding units contained in the article are obtained. The cost of the feeding stuff divided by this total of feeding units gives the price per unit. Example: A cotton cake contained

	Per cent.	Feeding units.
Albuminoids ...	22.1 x 2½ =	55.2
Oil ...	5.2 x 2½ =	13.0
Carbohydrates ...	33.2 x 1 =	33.2

Total feeding units ... 101.4

The price of the cake being £5 7s. 6d., the cost per feeding unit was just about 1s.

Note to Regular Subscribers.

We may remind our readers that we are prepared to analyse free of cost for our regular subscribers, who are farmers, and not in trade as vendors of fertilisers or feeding stuffs, samples of minimum lots of 2 tons of either article, in cases where there is solid reason to suspect an attempt to defraud. The analyses are published, under a *nom de plume*, in the paper.

We are also willing to publish replies in these columns to inquiries relating to the quality and use of fertilisers and feeding stuffs.

Necessity of Care in Using and Buying Cakes and Feeding Stuffs

Although in recent years there has been a general improvement in the quality of the cakes and feeding stuffs supplied to farmers, we still not infrequently hear of unsatisfactory results arising sometimes from the quality of the material being inferior, but sometimes also from their injudicious use. Examples of both these points occur in the recently issued report of the Analytical Department of Midland Agricultural-Dairy College.

It was pointed out that many farmers continue to purchase those foods and manures which cost least per ton, without regard to the real value of their substance. Many, too, are led to purchase inferior articles by the persistence of agents who, to secure commission, often make exaggerated statements, forgetting that in the long run it is the farmer who pays for extravagant expenditure in this direction.

Attention is drawn to the high percentage of water contained in many *Linsed Cakes*, the water having been deliberately added in the process of manufacture. It is an illegitimate source of profit to the manufacturer, and causes the cake to turn mouldy and to keep a much shorter time. It is recommended that buyers should insist on cakes containing not more than 11 per cent. of water, and stipulate for a reduction of 1 per cent. off price charged for each per cent. of water over 11 per cent.

Referring to cotton cakes, it is reported that

numerous deaths of young and pregnant animals were traced to the use of uncoarticated cotton-cake. Very full examination and analyses of the cakes failed to disclose anything peculiar in their composition, and the losses serve to show how unsuitable these cakes are for the above-mentioned classes of animals. Even with mature beasts uncoarticated cotton cakes must be used with care, for in one case full-grown animals were killed through being fed with too much of this cake.

The following are examples of cases which have occurred during the spring of this year:—

	2	3
Moisture	14.45	13.45
Oil	5.16	5.03
*Albuminoids	23.68	24.18
Mucilage	30.16	30.91
Woody Fibre	21.00	21.13
†Ash	5.55	5.30
	100.00	100.00

*Containing Nitrogen ... 3.79 3.87 3.02
† Sand ... 0.30 a trace
1. In the first case a cow in calf was lost. Eight to 10 lb. of this cake had been given per day; other food consisted of good meadow hay and swedes.

The veterinary surgeon reported: "I have examined your cow, and have found irritation of stomach and bowels. All other parts were healthy. The casting of calf was evidently due to the condition of the stomach and bowels."

My report sent with the analysis was as follows: "I have examined this cake for poisonous seeds, &c., and have found none present. The cake is of good quality, and is made from Egyptian seed. Although there is no castor oil or other poison present, I think it very likely that this cake caused the death of the cow and the loss of the calf. Cotton cake (uncoarticated) should never be fed to pregnant animals or to young stock; 10 lb. per day is too much for any stock."

2. In this case seven ewes were lost within three days. About ½ lb. was given per head per day, but some would get a little more than others. The ewes were on white turnips and had a little chaff and a small quantity of malt culms.

The remarks on the analysis were as follows:—

"I have been unable to find any poisonous substance in this cake, which is of good quality. Ewes in lamb should never be given uncoarticated cotton cake. . . ."

No. 3 was sold as a "calf meal," and was sent in with the stomachs and intestines of a calf.

The remarks sent with the analysis were as follows:—"This meal contains a large quantity of cotton husk and fibre, which make it a most unsuitable food for calves." The stomach showed signs of acute gastritis, which might have been caused by the unsuitable meal, much of which was present in the stomach. No arsenic or other mineral poison was found.

Use of Household Refuse in Germany.

The refuse from the Munich households, according to a recent consular report, is taken every day by specially constructed and covered vans to the Puchheim Works, a few miles outside the town. The cost of removing the refuse is borne by the local rates. The sifting of the refuse at the works is done by a system of drums, and with such expediency that the daily quantity of 700 to 800 cubic metres is dealt with within ten hours. Most of the matter is turned to account by the chemical works on the spot, such as bones, rags and paper, whilst metal scraps and glass are sold. The men doing the work are provided with gloves and must make compulsory use of the baths on the premises. These are well ventilated and washed with diluted carbolic acid twice a day. The best proof that all hygienic requirements are fulfilled is the fact that during the last seven years not a single case of infectious disease occurred. The quickly decomposing refuse, used as manure, reaches in some places a height of 4 metres, and is used to fertilise a tract of moorland on which the works are situated. There is now—the works have existed for ten years—an abundant crop of potatoes, rye, oats, beets, cabbage, radishes, cauliflowers, and cucumbers. The cultivation of beets is especially successful, as on an average £600 worth per annum are furnished to the Bavarian Beetroot Sugar Works at Regensburg. It is a remarkable fact that the crops on the older fields are of better quality and quantity than those on the newly-manured ground.

Some Familiar Faces in the Feeding Stuff World

(Held over from our issue of the 1st inst. We regret want or space obliges us to limit them).

Experiments with Lucerne.

Lucerne is without doubt one of the most valuable fodder crops, yielding from 20 to 30 tons per acre of valuable cattle food. It is particularly useful in dry seasons, as its roots penetrate a long way down and find moisture when other crops suffer from drought.

The Missouri Experimental Station have been conducting a series of experiments in connection with its cultivation, and have arrived at the following conclusions:—

1. Lucerne is being grown with success on various types of soil, although many soils are not well adapted to its growth.

2. A knowledge of the peculiarities of the plant will ultimately make it possible to extend its culture to most soil types.

3. Liberal manuring is the key to successful lucerne culture on the upland soils of the State. The manure may be applied before ploughing, and also as frequent top dressings.

4. The value of the crop as a feed, and its high yield where favourable conditions are supplied, make it a particularly desirable crop to grow, at least in small areas, on farms where mixed farming or dairy farming is practised.

5. While lucerne makes a most nutritious pasture crop, it does not lend itself well to pasturing unless certain precautions are taken.

6. When lucerne is grown for hay, difficulty is often experienced in harvesting the first, and sometimes other cuttings, on account of wet weather. The silo may be used in such cases.

7. Stiff subsoils are responsible for most failures reported, because it requires some knowledge of the methods of handling the crop to make it succeed under such conditions.

8. Lucerne is not adapted to soils that are sour, liming, manuring, or drainage being necessary to prepare such soils for the crop.

9. Lucerne grown on upland soils that have never grown the crop or sweet clover is benefited by inoculation. On bottom lands, or lands that are very fertile, inoculation has little or no effect.

10. The surest, and often the simplest, means of inoculation is by means of inoculated soil. The cultures prepared for seed inoculation have in many cases given excellent results, but they are still in the experimental stage, and some skill is required to handle them properly.

11. The best preparation of the seed-bed is that which allows of an early ploughing and the use of a harrow every time a crust forms or weeds start before time to sow the seed. The seed-bed should be much like that for wheat—loose above, but firm below.

12. The best time to sow in this state is between the middle of August and the middle of September, the last week in August usually giving best results.

13. The amount of seed to sow is between 15 and 20 lb., depending upon the quality and the character of the soil, and it is best sown without a nurse crop.

14. Lucerne must be clipped frequently the first, and sometimes the second season, especially on soils to which it is not well adapted. It should usually be cut when the lower leaves begin to turn yellow.

15. Disking occasionally after cutting, with the disks set at a moderate angle, is an aid in keeping out the weeds and grass, but its use is still somewhat experimental.

Perils of Refuse Manure.

Anthrax has broken out on a farm at Bradford Abbas, Dorsetshire. Two cows have died from the disease, and their carcasses have been destroyed. The outbreak is attributed to the use, as manure, of refuse from the glove factories of Yeovil.

The Advantage of Periodical Liming.

Writing under the heading, "How long does lime last in the soil," Mr. Hall, of Rothamsted Experimental Station, has contributed to the September issue of the *Journal of the Board of Agriculture* an instructive review of the advantages to be derived from the practice—nowadays too often neglected—of periodical applications of lime.

1. It improves the texture of the soil by coagulating the finest particles of the clay and rendering the land drier and more friable. Drainage goes on more readily, the land is warmer, and it is more readily worked to a good tilth. It is difficult to exaggerate the value of this action of lime on the heavier soils; it often means that it is possible to secure a seed bed when the unploughed land is still too wet to work, and the character of the root crop, particularly swedes, depends more on securing a good tilth than on manuring.

2. The insoluble reserves of nitrogenous and potassic material in the soil are brought into action and rendered available for the plant by the presence of lime.

3. All the leguminous crops usually cultivated on a farm flourish much better when there is a good supply of lime in the soil. Clover, in particular, is very intolerant of acid soil conditions, and is much more subject to clover sickness when lime is deficient. In 1906 alsike clover at Rothamsted was almost a complete failure on a plot where the carbonate of lime had been reduced to about 0.3 per cent., though it was good on an adjoining plot with about 0.5 per cent.

4. It seems to be established that the soil organism (*Azotobacter*), which fixes nitrogen without the aid of leguminous plants and is a great factor in the gain of fertility when land is laid down to grass, cannot develop properly unless there is a good supply of carbonate of lime.

5. Turnips are always liable to "finger-and-toe" when lime is deficient in the soil.

It cannot be doubted that the fertility of many of our fields to-day is due to the liming and chalking that was done by the farmers of the eighteenth and earlier centuries; they, indeed, made the soil, for it is through their labours that it remains in profitable cultivation at the present time. Owing to the very large amounts of chalk and lime which were then applied, it has been possible for later generations to live upon the capital thus accumulated, and dispense with any expenditure of their own in this direction. But this spending process cannot continue indefinitely, for natural causes alone—the percolating rain-water—are steadily removing the lime in the surface soil; for example, the Rothamsted soil, which at the beginning of the nineteenth century must have contained something like a hundred tons of chalk per acre, has now less than fifty, and many other soils which started with a smaller initial stock are beginning to run dangerously short. All over the country there is evidence that much of the land, especially on the heavier soils, is in need of liming, and though it would not be wise to return to the old wasteful dressings of six to ten tons to the acre, a much smaller quantity, half a ton or so per acre, could be profitably applied at least once in the course of each rotation.

It is reported that the arrangements for the erection in Lincolnshire of a beet-sugar factory are progressing in a satisfactory manner, although some doubt appears to exist in the minds of many of the farmers whether the prices which they will be paid for the roots will be as remunerative as the results which they can obtain from the cultivation of the usual crops. The secondary advantages from beet-sugar cultivation, such as cattle food from the factory refuse and an increased supply of manure should not be overlooked.

Minor Sources of Nitrogen.

In consequence of the high price of nitrate of soda, which is the chief source of nitrogenous plant food, more attention will be directed to sulphate of ammonia, Peruvian guano, and the minor sources of nitrogen derived from various waste products.

The Board of Agriculture has recently issued a leaflet, No. 175, giving some useful information about these waste organic substances:—

They have long been extensively used in Kent for hops, as well as round London by market gardeners for vegetables and fruit, and there seems no reason why they could not be employed with advantage for ordinary farm crops.

They serve the following purposes:—

1. Increase the supply of plant food in the soil.
2. Improve the mechanical condition of the soil.
3. Retain moisture in the soil.
3. Encourage the growth and work of beneficent micro-organisms, upon whose activity the productiveness of the soil is dependent.

Among such substances may be mentioned dried blood, fish guano, ground hoofs, shoddy, waste feathers, greaves, meat guano, rape cake, soot, &c., all of them useful substances when they can be obtained cheap and of a reliable quality.

They are valuable for the organic matter they contain, which slowly decomposes in the soil, being gradually converted into available plant food.

Ground hoofs, dried blood and fish guano are rich in ammonia, and are recognised as such valuable fertilisers that there is always an active demand for them, so that the fertilising constituent in them is not particularly cheap.

But in shoddies, feather waste and hair, the ammonia is considerably cheaper, and if they can be locally obtained and applied without much expense, they are certainly worth putting on the land.

It is necessary, however, to point out that their quality is very uncertain, so that buyers should have a guarantee of quality, and should get samples tested.

Shoddy varies in its contents of ammonia from 13 per cent. down to 3 per cent.; greaves from 3 to 6 per cent.; fish guano and meat guano are variable.

We repeat, therefore, that buyers must safeguard their interests by making sure of the quality they receive.

It seems uncertain whether such waste substances will fall within the scope of the Fertiliser Act, because it is most difficult for a seller to guarantee their contents within reasonable limits, and yet it is just in these waste substances that farmers are most exposed to overcharges and deceptions. It is a matter which the Board of Agriculture will no doubt carefully consider when drawing up regulations for sampling and analysis. As it is almost impossible for the seller to guarantee the ammonia in waste products of so variable a character, it would seem reasonable that they should be sold at a price fixed per unit of ammonia, as ascertained by analysis of sample.

If a seller chooses to give a guarantee, he must give one well within the margin of chance, or accept the unpleasant responsibility involved if the quality proves lower than expected.

A very exhaustive series of practical feeding experiments, both with cattle and sheep, has been conducted in this country with dried grass, and almost without exception they have proved more economical than any other concentrated food or mixture of foods. Dried grains alone, or, better still, mixed with decorticated cotton cake, have often proved superior to linseed cake both for cattle and sheep.

Nitrogen-fixing Bacteria.

In the annual report of the New Zealand Department of Agriculture the history of nitrogen-fixing bacteria is discussed, and a series of reports are given showing the results obtained from experiments on beans, peas, vetches, and red clover. The results seem to demonstrate (1) that on land which will already produce a good crop of legumes, the inoculation is of little benefit to the crop treated, but (2) it increases the number of nodules on the roots, and consequently the quantity of nitrogen left in the soil for the benefit of a following crop, such as grain or roots, which have not the power of providing nitrogen for themselves; (3) the inoculated seed invariably gave better results than the inoculated soil. The relative merits of inoculation by means of infected soil and by pure cultures are discussed, and directions and precautions to be observed in the use of inoculating material are given.

As Captain Cuttle in "Domby and Son" used to be fond of saying, "when found make a note of it," so we who are interested in British agriculture might make a note of the following remarks from the report of the English Consul at Düsseldorf:—

"Germany is no field for dishonest dealers in cake, mineral manure, seed, and meals; they get no chance here at all; science has come to stay among the farmers—among all classes of farmers, great and small; they all recognise the absolute necessity and the pecuniary benefit bestowed upon them by having due knowledge of chemistry and making use of this science to know how to judiciously feed their stock, produce milk, meat, or muese, how to feed the crops with certain quantities of nitrogen, phosphates, and potash, and make use of the many Government technical, scientific, and chemical testing institutions established for the welfare of the community and all who choose to use them.

CORRESPONDENCE.

To the Editor MARK LANE EXPRESS.

DEAR SIR,—I am sending herewith two samples of Bombay cake, marked respectively A and B.

A purchased in 5 ton lots August 1; cost £4 17s. 6d. on rail nearest station.

B, purchased from another merchant September 13; cost same price in 5 ton lots.

On lot A bullocks have apparently thrived and done well. With the same quantity of B they do not appear to do so well, and the eake seems of a more woolly nature.

Would you kindly have the samples analysed for me, according to the terms of your gratis offer to regular subscribers and inform me through the columns of your valuable journal the comparative feeding value of each.—Yours truly, "CARPAX."

[We beg to apologise for the delay in answering this inquiry. It has been caused in consequence of the attention of our expert having been completely absorbed by his duties at the Dairy Show. He has now examined the samples and found them both satisfactory as regards purity, but the B sample contains more husk and fibre. In this week's issue we gave a report showing the necessity of prudence in the use of undecorticated cottoncakes.]

To the Editor MARK LANE EXPRESS.

DEAR SIR,—I should be extremely grateful if you could kindly send me (or give me the address) the tables which are published giving the value of manurial residues derived from different feeding stuffs, and which you refer to in your issue of October 1.

May I add, as a constant reader of the MARK LANE EXPRESS for more than twenty years, my very great appreciation of its merit, and particularly of its continuous improvements.—Yours truly, A. D.

[The table referred to appeared in the Journal of the Royal Agricultural Society of England, Vol. 63, 1902. It is based on the tables of Messrs. Lawes and Gilbert, compiled in 1897, and is accepted by estate agents and valuers as forming the best guide at the present time. The position will, however, be modified when the Land Tenure Bill—which has already passed through the House of Commons and will be considered by the House of Lords this autumn—becomes law.]

Sale of Widnes Chemical Works.

The Chemical Trade Journal reports that the business and plant of Messrs. Thos. Hudfield, Ltd., chemical manufacturers, of Weston Point, Cheshire, was put up for auction on the 20th inst., by Mr. George Gaunt, of Liverpool, acting on instructions from Mr. T. S. Sheard, the Receiver appointed by the Court of Chancery. It was sold as a going concern for the sum of £25,000. The business and property had for some time past been for sale by private treaty, but no "deal" was arrived at. The auction was interesting as a practical test of value. A number of buyers from all parts of the country attended with a view of picking up details, but the sale *en bloc* prevented the attainment of their object.

The Nitrate of Soda Position.

Total shipments for the month of September are officially reported to be 86,927 tons, against 108,500 tons during the same month last year, and the quantities in course of being loaded on the first of this month are advised as being 160,626 tons, compared with 155,400 tons at the corresponding date last year.

The stocks available for shipment in Chili are said to be very heavy, amounting to 560,000 tons, against 471,200 tons at the same period in 1905.

THE "BIBBY" CAKE IN THE FORM OF "CAKETTES."

"Send me two tons of they nobbs same as Mr. Brown is a using" was the colloquial way in which a new customer gave us an order the other day through our Market Representative.

This buyer had often thought he would like to try the "Bibby" Cake, but he belonged to the old school of farmers who are not easily led along untrodden paths.

He had, the previous week, been paying a visit to his neighbour, Mr. Brown, who had often spoken favourably to him of our Cake, and on looking over his Stock and noting the extreme handiness of the "Cakettes" for Summer Feeding, he at last resolved to give us a trial order, and did so in the words just quoted.

It was doubtless the good condition of Mr. Brown's Cattle and the manifest handiness of the "Cakettes" which had finally broken down this buyer's conservatism; and now we have received a trial order we shall take good care to retain his business. Our method is a simple one: We put such value into all our Cakes and Meals as will insure the best results obtainable.

THIS IS THE TRUE SECRET OF OUR SUCCESS.

It is, perhaps, hardly needful to point out in this place that the "Bibby" Cake is the most popular brand of Cake that has yet been made, and no other explanation but the one above mentioned will explain this fact.

It is not well, therefore, for buyers to be put off with a Cake which is offered as something "just as good"; it is much better to say to the Cake merchant: "I must have 'Bibby,' and will not take a substitute."

The "Bibby" Cake has steadily won its way to

THE PREMIER POSITION IN THE PUBLIC FAVOUR,

and of all the Cakes on the market is admittedly the best. In the form of "Cakettes" it is also the handiest; there is this further to be said about it—the more carefully it is tested against other competing Cakes, the more certainly and with increasing emphasis will be the reply to those who offer a substitute:—"I MUST HAVE 'BIBBY,' PLEASE; THAT IS THE CAKE I WANT, AND I WILL TAKE NO OTHER."

BARLEY FOR MALTING PURPOSES.

The opening of the Brewers' Exhibition brings into prominence more than one question connected with the cultivation of barley in this country. That a large proportion of 1906 barley is steely, and that mellowness in samples is more than usually rare, is an event which must be ranked among things which we call the fortune of war, and there is another side to this particular matter; the barley of 1906 if it seldom satisfies the aspirations of the fine ale brewers, seldom falls to merely feeding level. Quantity exceeds the average, and it is not at all certain that prices will not prove an improvement on the preceding campaign. What is the leading question raised this October relates to the possibility of largely increasing the growth of barley in this country.

In 1873, the first year for which we have full returns, 2,575,000 acres were devoted to barley, but recently the total has been about 800,000 acres less than this. Now the demand for beer since 1873 has increased by at least 20 per cent., largely by sheer increase in the number of consumers. Consequently the area under barley

for 1907 ought to be, at the least, 3,000,000 acres. Why should it not be?

The fault is not with the price which maltsters and fine ale brewers are willing to pay. Their buyers are commissioned to pay a penny per lb. for the fine bright types of barley, whereas wheat at present fetches only '67 of a penny per lb., and oats are '63 of a penny per lb. Can farmers make the type of barley requisite?

The question of a large wheat crop is often one of liberal manuring, but the manuring of barley can easily be overdone, and the limits to farmers' powers of growing malting barley may be said to be these:—(1) fit soil, (2) favourable aspect, (3) good harvesting. The first of these requirements, the geologist assures us, will allow of a great extension of the present very small area. Not only should the 2,575,000 acre standard of 1873 be regained, but it may be extended. There are quite four million acres of British soil naturally fitted for growing good barley.

The second need resolves itself into such an arrangement of the farm as would secure for the barley crop preferential treatment. This demand, it may be submitted, is not unreasonable so long as there is a margin of '33 of a penny per lb. in favour of barley prices as compared with competing cereals.

Finally, [there is the good harvesting, and though a wet August may cause a great discoloration, a determination to stop other work and snatch every occasion to get barley in will in our variable climate make the farmer largely the master of the situation.

There are other points of interest involved, but at present it will be enough if we name the bogey of foreign competition. In the wheat trade, in the oat trade, this is a very real bogey. Mr. Lang, in his latest book on the supernatural, has told us of a ghost which bit. Foreign competition is a ghost which bites. But it only bites the growers of other cereals than barley. Surely this is a matter for farmers to think over. If they will exert themselves and study to grow malting barley, they need never concern themselves "with what the Gaul pretends or what the Russ."

Even if the sample falls below the standard of Burton there need never on English soil and

with English food cultivation be a decline below the level of bold poultry barley, and the average price of this we work out at at not less than '72 of a penny per lb. The barley grower therefore should be in a safe position as far as any grower of cereals nowadays can be. He should always have his chance of an admittedly remunerative price if he gets his barley up to fine malting standard, while even where luck fails and that standard is not obtained, the price realisable for his barley should be somewhat higher per lb. than that secured either for wheat or for oats.

AGRICULTURAL LAW.

Advice of a Legal character is offered to Readers entirely free of charge. Particulars of cases should be addressed to the Editor, "MARK LANE EXPRESS," 3, Wellington Street, Strand, London, W.C.

"Carting Away the Freehold."

SIR,—Will you kindly answer the following in your next issue:—A hires a glebe farm in addition to his larger occupation, and as the glebe land is very foul he burns the rubbish on large heaps and carts some of the ashes on to his home farm. To this the rector objects, as he says it is carting away the freehold. Is a legally entitled to do this?
SUSPENDER.

October 17, 1906.

Answer: I was highly amused with the vicar's contention that burning the rubbish on the field and carting the ashes away amounts to a carting away of the freehold. I suppose, however, that the vicar considers that the ashes should remain on the fields, or is it the rubbish that he requires? If the ashes improve the field I should not remove them. "A soft answer turneth away wrath."
BARRISTER-AT-LAW.

Mr. William Child, a successful brewer of Shire horses, was found lying on the road near Gainsborough the other night seriously injured, and died without regaining consciousness. He had attended a stock sale during the day, and it is supposed that the animal became unmanageable on the way home, and threw him.

A largely attended meeting of the committee appointed to formulate the scheme for the extension of a sugar beet factory in South Lincolnshire, of an estimated cost of £200,000 was held at Scunthorpe on Wednesday, when it was reported that negotiations with the railway companies had now been completed, and the final selection of a site was therefore deferred for a fortnight. It was announced that numerous applications for shares in the company had been received, and also for dealing with the by-products.

Notes of the Week.

As the date approaches for the opening of Parliament, the voice of the politician is heard more frequently in the land.

It may be noted that agricultural matters are receiving more attention than usual.

Earl Carrington is sparing himself no trouble to convince the farming community of the benevolent intentions of the Liberal party.

In a few months' time we shall know whether this friendly disposition, which we are already convinced exists in Lord Carrington's mind, also extends to the other members of the Government.

Conservative members are similarly posing as the farmer's friends.

Lord Lansdowne in a recent address made the happy quotation from Kipling.

"Great is the sword and mighty is the pen,
But mightier still the labouring ploughman's blade,

For in her oxen and her husbandmen
A nation's strength is laid."

And yet some people venture to think that agriculture is neglected.

Agriculture is the greatest industry in the country, and agricultural prosperity the surest foundation of a country's general happiness.

The Parliament of the country, the richest country in the world, cannot spare more than £120,000 to promote its interests.

Farmers in Bavaria are noting with satisfaction that mistletoe is becoming less abundant.

This is not from an objection to the privilege which a bit of the plant in a particular position gives to a man,

But because of the injury which the parasite has caused to large numbers of apple trees.

The potato crop in Germany amounted to about 42,000,000 tons in 1903, and increased to over 47,000,000 tons in 1905.

Old Lady: "Are you sure it is English mutton?"

Butcher: "Well—er—born in New Zealand, Madam, but of English Parents."

[of the Proprietors of "Punch."

The bold and progressive action of the Lincolnshire Farmer's Union is awakening great interest.

Nothing is so contagious as example, and therefore it may confidently be hoped that other counties will follow the lead set by Lincolnshire.

"Union is strength," "United we stand, divided we fall," are truisms old as the hills, and resting on as sure a foundation.

A federation of farmers unions, independent of any political party, and representing only farming interests, would wield enormous influence.

Such a movement deserves the energetic and enthusiastic support of every farmer in the country.

In Germany in the course of last year 96,834 horses and 1,584 dogs were slaughtered for human food.

Beware of alien sausages!

The United States of America allocate for the purpose of agricultural research the sum of £1,265,000.

The United Kingdom the magnificent sum of £119,337. About as much as the London County Council devote to the building of a municipal hall.

Board of Agriculture contains several articles of a very useful character.

There are about 1903-one margarine factories in England and twelve in Scotland, but the bulk of margarine comes from Holland.

As somebody said, the fault of the Dutch is giving too little and asking too much.

At Knaresborough horse fair on Wednesday there was a fair show of horses, and a good demand for the best. Best cart horses made £40 to £65; secondary ditto, £25 to £35; harness ditto, £30 to £40; and ponies, £10 to £20 each.

The Irish Potato Crop.—A deputation from the County Council, Corporation, and Harbour Board of Sligo waited upon the Chief Secretary for Ireland on Wednesday in reference to the distress which is threatened in consequence of the serious failure of the potato crop, and urged the immediate necessity for relief works being instituted. The Chief Secretary (Mr. Bryce) said that the question of distress in consequence of the failure of the potato crop in certain districts in Ireland was receiving the anxious consideration of the Government, and he assured the deputation that the matter they had brought forward would receive proper attention. So far as his present information went, the failure of the potato crops, although serious, was not so bad as some had represented it to be.

ing-in day of Entries for the Norfolk Christmas Fat Stock Show.

MONDAY, OCTOBER 23.—Agricultural Sale, Harleston—Buxton, Cannock, Helston, Mossley, Totnes, Wellingburgh, and Halyburton Fairs—Midhurst Cattle Fair—Horncastle Agricultural Fair, first day.

TUESDAY, OCTOBER 30.—Horncastle Fair, second day—Ashford Cattle and Sheep Fair—Preston Cheese Fair—Collingham Farmers' Club Show.

The Dr. Fream Memorial.

A meeting of the general committee of the Dr. Fream Memorial was held during the Dairy Show week at the Royal Agricultural Hall, under the presidency of the Earl of Jersey. After considerable discussion it was ultimately decided that the memorial should take the form of a research scholarship, provided sufficient funds were forthcoming, failing which the institution of Fream gold medals and presents of books as prizes for agricultural research work.

It was mentioned that the Board of Agriculture and Fisheries had agreed to undertake the direction of the memorial.

For the endowment of a research scholarship something like £2,500 will be required, and it is sincerely to be hoped that the appeal which the committee are issuing will meet with a speedy and generous response.

Notes and Jottings.

"He doth nothing but talk of his horse."
—"Merchant of Venice."

TURNING over some old papers the other day I came across a curious incident in horse breeding such as was entirely new to me, and which I think will be new to most of my readers. Some sixteen years ago the well-known Hackney breeder, Mr. J. Makeague, sent a mare heavy in foal to Mr. William Flanders, of Mepal, Isle of Ely, to be nisted with Reality after she foaled. In due time she foaled a filly foal to Lord Derby II., and a fine, strong, healthy filly she was. She was foaled with an udder full of milk, which flowed freely from her teats, and her dam had no more show of milk than a gold mare. Naturally Mr. Flanders was put to his wits' end by such an extraordinary occurrence, but being a man of resource he commenced feeding the foal and managed to keep it alive for a few days.

BUT the most curious thing has yet to be told. At the end of two or three days the mare's milk "came," and of course as soon as she gave signs of milk the foal was put to her. Unfortunately, however, the milk seems to have been tainted—at any rate, the foal sickened and got into a very weak state, and was very like dying. Mr. Flanders was unremitting in his attentions, and they put the mare through a course of physic, and whilst this was going on kept the foal alive by hand-feeding. Then when physicking was over the foal was again put to the mare, and this time with excellent results, and within a day or two, or when the foal was eight days' old, she was beginning to play about a little. A fortnight later mare and foal were doing well, and the udder of the latter was quite dried up.

THE unremitting care and attention of Mr. Flanders, and those about him is, of course, the first thing that strikes one on reading this very extraordinary occurrence—but at the end of sixteen years the question seems to me to be even more interesting than it was at the time, and it presents two or three features which are worth consideration. How many men are there who would have looked upon the situation as hopeless from the first? I am afraid a great proportion of breeders would scarcely have made an effort to save the foal under such circumstances. They would have looked upon the case as hopeless, recorded it, and there an end. So that one lesson is that no matter how abnormal may be some of the circumstances connected with a foal, provided the foal be strong and healthy when foaled, it should, with ordinary care, be reared in ninety-nine cases out of a hundred.

A QUESTION which presents itself to me is that there is very likely always a great risk when a mare's milk is late in coming. Mr. Makeague in the account he gives, says the mare's milk was tainted, and perhaps it was, though perhaps it was not necessary for the milk to be tainted for the foal to be affected. My own experience with brood mares has always been that there is a good supply of milk from the first. I do not remember a single instance of a mare of my own, or of a mare coming immediately under my notice, in which the supply of milk from the moment of foaling was not normal. But, however carefully a foal might have been fed, is it not possible that, when it was put on to its dam, especially if a hungry, healthy foal, after three days of hand-feeding, the change of food would have a prejudicial effect? It may, of course, be urged that when the mare had been physicked the foal did well on her milk, but then the foal was over three or four days older, and consequently much stronger.

THE curious thing, of course, is the foal having an udder full of milk. It is not an unknown thing for some animals to make a great show of milk that have never had young—indeed, with young foxhound bitches it is very frequent and sometimes they look so much like nursing mothers that the question has been asked of the huntsman, "What have you been doing to let that bitch have a litter?" In Friedberger and Fröhner's "Veterinary Pathology," one of the most exhaustive books I have come across, speaking of unusual

lactation, "it is stated that the secretion of milk and swelling of mammary glands sometimes occurs in many animals in the absence of pregnancy. In single cases this has been observed to arise from the animal having fancied itself pregnant, or that it had given birth. Thus in bitches (pugs) we have often had occasion to notice lactation quite independent of either pregnancy or parturition. Among 70,000 dogs treated in the Berlin Dog Hospital, sixty-five cases of this unusual lactation were observed. The same occurs also in horses, cows, goats, and sheep." But so far as I can gather, these keen observers do not seem to have come across or heard of lactation in a foal.

CONCERNING agalactia or the arrest of milk, they have something to say which the breeder may remember to his advantage whenever or if ever he should have a mare foal without making a show of milk. "Arrest of milk," say they, "is one of the earliest symptoms of internal disease, and especially of stomach with bowel complaint. It also arises from bad feeding, prolonged hunger, as well as from over exertion in work." This, of course, throws considerable light upon the case of Mr. Makeague's foal. The complications set up by disease of the stomach or bowels in the mare and the change of food to the milk, that would certainly be affected if not exactly tainted, are quite sufficient to cause the 'serious illness of the foal.' Whenever a mare is found to have no milk at the time she foals, the wise plan would seem to be to send at once for a veterinary surgeon and have her thoroughly examined, and, at any rate, when the milk does come, she should be put through a course of physic when the foal is put to her. Perhaps, too, if the latter is strong enough, a little castor-oil when the change of food takes place would be beneficial. But in all abnormal cases veterinary advice should be sought.

I WONDER how many of my readers have ever had anything to do with a Casarean horse. I rode one for some years—indeed, she was the first Hunter I ever rode, and as she had rather a curious history, I will relate it. She belonged to a relative who got her during the war, and who was killed by her fall from his horse. The dam was a well-bred mare of what would now be called the Polo pony type, by Dr. Syntax, dam by Ling Cropper. She was as good as she was well-bred, a wiry, fast mare, and as hard and tough as they make them. She bred my relation a foal or two which he did not care very much about, and which he sold, and then she was barren several years. As it seemed certain that she would not breed any more to thoroughbreds, my relative named her with a short-legged, active cart-horse named Short Legs. Now this horse, though called cart-horse, was something so different from the cart-horse of the present day, as exemplified in the Clydesdale or Shire horse as could well be. He was a firm stepper and had the cleanest and flattest of bone. I never saw him, but from descriptions I have had of him I should think he was not improbably one of the Northumberland Vardy horses, or at any rate, that he had some of the Northumberland Vardy blood.

THE old mare was in foal to him, but when her time was up it was evident that she could not produce a living foal. A veterinary surgeon who was called in told my relative how to perform the Casarean operation, and told him when it was to be done. When the time came the mare was shot and the operation carefully and quickly performed. A grey filly foal was brought to light, and was of course the pet of the establishment. She thrived well on cow's milk, with which sugar was mixed, and in course of time she was broken in. What was she like? Well, she had a plain, cart-horse head, a very plain one, and her neck was a little set the wrong way up, but her shoulders were well placed, she was short coupled, and well ribbed. She was a little short and round on her quarters, but she had the best set of legs and feet I ever saw on a horse. She stood about 15 hands 2 in., and was a beautiful dappled grey.

A NICE old-fashioned stamp of riding and driving mare, you would say from that description, and so said everyone that had to do with her or saw her. Yes, all except the mare herself. In course of time she was put into the "chains," alongside a pair in a plough. In three minutes she had kicked herself clear. Another attempt was made, and she got rid of the chains in even less time, and after a morning's work in which she was emphatically triumphant. Whether any further attempts would have been made to put her in harness it is impossible to say, but it so happened that a hard season's hunting had had its effect upon the stud, and her owner said if she won't do one thing she shall do another. So he rode her, being then three years old, to meet her owners few miles off in a rough hill country. If she had been a horse of any value she would have liked hunting, and the way she jumped a wall or two sealed her fate, and a hunter she became.

AND she was a very good hunter too. She could not gallop fast enough to turn herself," said some of the critics, and perhaps she could not, but if a man had a hard enough heart he could see the end of a good lung run when many a flash one was hopelessly beaten. She could jump anything she could put her nose on, she was hunted certainly ten or eleven seasons regularly, and she was ridden by all sorts and conditions—men that could ride and men that couldn't. She was the same contenting mount to them all. If the man wanted to go to hounds, she would take him the shortest way; she did not know how to refuse, and she never fell but once in her life, when she jumped into a bog, which of course caused her to come to grief, especially as the bog was at the landing side of a big wall. I am bound to admit, though I have a very warm corner for the old mare, that I would not care to ride one like her now, for she pulled like original sin, and was a bit of a bone-setter. But she knew her business, and was a two-days-a-week mare most of her hunting life.

WE tried several times to get a foal from her, but without success till the groom who had assisted at her bringing into the world, and who had prospered in life, suggested that we should try her to a cart horse of his—Yorkshire Stingo. This we did, and the result was a filly foal. The old mare had very little milk, and she hated her foal like poison; and after a few days' unremitting attention, in which the end was foreshadowed from the first, she died, and we had had quite plenty of breeding from the old mare. After this my brother rode her for some two or three years as a hack, and she dropped down dead with him, curiously enough, within a mile of the kennels. When she was opened her heart was found to be very small and withered; there was nothing else abnormal about her. She was nineteen years old, approaching her twentieth year, and her legs were as clean as the day on which she first saw the light. As I have said before I never saw such wearing legs in my life. And when I come to think of the unfortunate foal she had I am inclined to think we might have saved it if we had given the mare physic and castor-oil, and had fed the foal for a few days. I should add that this is the only instance I have known of a Casarean mare breeding, and I have been told that the foal would not have lived because its dam was a Casarean mare. I do not see why it should not, having once existed; and it must be remembered, in respect to the short-legged mare being a shy breeder, that her dam was a shy breeder also. THE LOOKER ON.

The Blagdon Shires.

A sale of Shire horses that should attract considerable attention from breeders is to be held on November 7, when Messrs. Sexton, Grimwade, and Beck, of Peterborough, will bring under the hammer just over forty animals of the best Shire blood belonging to Mr. Clement Keevil, of the Blagdon Shire Stud, Billington, Leighton Buzzard. The catalogue includes twelve Shire foals, several by Blagdon Benefactor, Locking Midnight, Birdall Menestrel, Dunsmore Jameson, &c.; one, two, and three year-old fillies, yearling stallions; also two four-year-olds, one by Locking Forest King, and one by Ercall Wynn, and some exceedingly well bred in foal mares, which are good workers. Included in the above are several promising young animals that have not been exhibited, which are sure to come to the front in the show ring, also Blagdon Princess, the champion mare at Buckingham Show, and the prize-winning foals Blagdon Armour Plate and Flower of Blagdon, &c. The sale will take place at Billington, and be without reserve, so that it presents a good opportunity to breeders. Catalogues may be had of the owner or of the auctioneers.

Sales at the Cheshire Repository, Crewe.

Messrs. Frank Lloyd and Sons special October prize sales will be held on Wednesday, Thursday, and Friday next. Wednesday's sale includes 250 high-class Hunters, including many well-known performers, and who have all been well summered and cob hunted up to date, they are in hard condition and fit to go, being the finest selection offered for some time in any repository.

For Thursday's sale 350 ride and drive horses, match pairs, pedigree Hackneys, show cobs, and ponies have been entered. These are of grand quality, have bone, substance, and manners, including a large number of prize-winners at the leading shows of 1906, and can be highly recommended.

Friday will witness the big show of the week of 125 pedigree Shire stallions, mares, fillies, and foals from the most fashionable blood of the day, including great prize-winners in the show ring; drafts from important studs are sent to this sale, and they should make a record; 175 heavy town mares and geldings, some of great substance and quality, the bulk warranted sound, being specially reserved by farmers and breeders in this district. The sale on this day concludes with 100

one, two, and three-year-old colts and fillies, broken and unbroken, with rare substance, many being by pedigree sires; they are of the right sort to grow into massive draught horses. The sale commences each day at 12 o'clock.

Sale of the Blaenon Point Clydesdales.

An important sale of Clydesdales from the Blaenon Point Stud, Chester, took place at Lanark on the 11th inst. Owing to the death of Mr. Thomas Smith, the owner of the stud, the executors resolved to dispose of the whole of the splendid breeding mares which Mr. Smith retained when he sold his other stock in the spring of 1905. Blaenon Point has for long been renowned for its Clydesdale stud, particularly for the high standard of the female stock bred there. The speciality of Blaenon Point was mares and fillies, and the rearing of these was a pursuit which Mr. Smith had followed with no small amount of zeal.

The catalogue for the sale comprised 15 animals—7 mares, 3 fillies, and 5 stallions—and they came in for a good deal of competition, the attendance of buyers being very large. Royal Rose, a sixteen-year-old mare, was the plum in the female class, and up till nearly the 500 guinea point the bidding for her from all round the ring was very lively, but Mr. William Smith was not to be shaken off, and, after a keen tussle with Mr. Stephen Mitchell, he secured her at 515 guineas to found a stud in his new home in Cumberland. After the sale the bidding was also very animated, the top price being realised for British Chief, for which Mr. Stephen Mitchell gave 750 guineas. The sale all over was a highly satisfactory one, as shown by an average of £216 10s. 6d. for fifteen animals. Six mares averaged £172 4s.; three fillies, £51 16s.; five stallions, £368 11s.

Sale of the Ruddington Shires.

There was a large gathering at Ruddington on Thursday, when the last sale of the farm stock of the late Mr. Philo L. Mills took place. The Short-horns, Shropshire sheep, Large White pigs, and Berkshire pigs were sold during the summer, and the splendid stud of Shire horses, which Mr. Mills was at so much trouble to form, was now dispersed by auction. It consisted of twenty-two brood mares and foals, six foals, three two-year-old fillies, eight brood mares, four yearling fillies, six yearling colts, and six stallions, making a total of fifty-five animals.

As is well known, the Ruddington Shires have for many years taken a leading place among the many great studs of the Midlands, and their dispersal is a matter for general regret. In its formation Harold Premier and Bury Victor Chief played a leading part, and of late years descendants of Hitchin Conqueror have been brought into use. That the stud has been in an eminently satisfactory breeding condition was proved by the number of foals catalogued. Amongst the mares were some very valuable animals, and the foals—fillies and young stallions—are sure to do well.

Unfortunately for the sale, rain fell heavily, and the proceedings were conducted under most unpleasant conditions; but, nevertheless, there was a large attendance of breeders of Shire horses, a few buyers from the United States and the Argentine being also present. The best mares, fillies, and foals sold well, but the demand for stallions was not so good. The highest price was 230 guineas given by Mr. F. E. Muntz for the yearling filly Ruddington Brunette by Intake Albert. The same buyer gave 220 guineas for the famous brood mare Ruddington Heiress by Calwich Heirloom, and 190 guineas for Caper Sauce by Calwich Victor, another well-known prizewinner. Mr. E. Orme secured the fine mare, Knottingly Stella, at 120 guineas, her colt foal being bought for Lord Rothschild at 50 guineas. Mr. Freckleton bought the mare Victorine for 92 guineas. The stallion Boro' Conqueror II. realised 100 guineas from Mr. Williams; Ruddington Conquering Hero, 125 guineas from Mr. Whitehead; and Ruddington Conqueror, 115 guineas from Earl Mansvers. The average for fifty-five head was £65 6s. 7d.—total, 3,317 guineas, the results being considered satisfactory.

Pig Sales.

Messrs. J. Thornton and Co. are conducting two important pig sales this week—viz., on Wednesday, a draft from Sir Alex. Henderson's herd of Berkshires, at Buscot Park, Faringdon, Berks, and on Friday, Berkshire and White Yorkshires from the herds of Mr. Arthur Hiscock, at the Manor Farm, Motcombe, Sharnbury, Dorset. Both herds are so well known as suppliers of numerous prize winners at our principal shows, that it is needless to enter into a description of them. The animals to be offered will well maintain the high reputations of the herds, and as those belonging to Mr. Hiscock are to be offered without reserve, breeders have a rare chance of securing first-class stock. Catalogues can be had of Messrs. Thornton and Co., 1, Princes Street, Hanover Square, W.

Notes and Jottings.

THE arranging of the dates for next year's shows is now occupying the minds and time of many secretaries, councils, and members of different societies, and should do so. It would appear rather to be regretted that some association cannot be formed for regulating this sort of thing. It is quite perplexing for exhibitors, as it is unprofitable to societies, when the dates of holding shows clash so continually with one another. There appears, and one can but say it is natural that it should be so, that there is a great objection to holding shows on a Monday, otherwise if some societies would agree to hold their shows on Tuesday and Wednesday, others on the Thursday and Friday, there would not be so much clashing of our two day county shows. Such an arrangement would enable two of these shows to be held the same week without clashing.

THE arrangement as to show days of the important shows of the Bath and West of England is one that causes a great upsetting of

smaller herds upon smaller farms, and in the hands perhaps of less wealthy owners, more than one such man cannot be afforded.

ALL the several points mentioned in the above notes should be well considered by the management of our various societies, and every endeavour made to meet the needs and wishes of exhibitors, for after all it is the exhibitors that make the show and not the visitors. Were the exhibitors to withhold their stock there would be little either to interest or instruct visitors, and the thing would fall into a cold and uninteresting matter, useful to no one. The holding of shows on two earlier days and two later days in the week instead of on the two middle days, as is now commonly the case, and to curtail those shows that extend over a period of more than three days or four at most, are the main points that could be considered, and if practicable to arrange the days as indicated, very much clashing would be avoided and many societies would be much benefited.

GOING from the arrangements of the dates of shows to a section of them that is of very great importance nowadays, and connected with our cattle, is that of the dairy. In the showyards the working dairy attracts a great number of people. Especially has this been the case lately in the London Dairy Show, and the exhibition of that society held in London last week was visited by many thousands of people who spent many hours watching the manipulation of the milk from the first course, that of milking the cows, to the last one, that of making up the pounds of butter, weighing and selling them to the public; and how very satisfactory it ought to be to these visitors to see what cleanliness is observed in these dairies. After reading of the manner in which

with it. This cleanliness to be thorough should begin with the cow. During the summer season on most farms the cows are lying out day and night on the clean, green carpet Nature has provided for them, and very little filth can possibly be brought from the sheds to the dairy at that time of year; in winter, however, things are very different; the cattle are lying in the sheds invariably all night, and in many places all day, too, very frequently without bedding altogether, or, at best, with a very scanty amount.

IT is at this time of year that milk vessels become dirty from dirt proper, much filth lodges upon the cow's udders from the dirty bedding or the bare floor, and when milking commences is dislodged from its place and falls into the pail. To brush or sponge the udder before beginning to milk is a very great preventive of this source of dirtiness, and ought to be always done where the lying of the cattle is in such condition as intimated. When there does not appear to be time to brush or sponge the udders, such as when trains have to be caught, or other urgent business is to be attended to, the pails should not be drained of the last atom of their contents. Dirt is heavier than milk, and all settles quickly to the bottom of the pail; any light matter such as bits of hay or straw that may by any chance be blown or fall into a pail are always removed by the strainer.

ANOTHER matter that often affects the cleanliness of the dairy products, even in a more dangerous manner than the dirt from the udder or from the surroundings, is the lack of efficient scalding of the various utensils with boiling water, and also leaving them open in a good wholesome pure atmosphere to air and dry. Many milk churns that have come off the railway with their lids fastened down have a disgusting smell with them, and oft times small delivery cans used in private families are sent out for milk when smelling in a most unwholesome manner. A little Condyl's Fluid, boiling water, and an open airy place to dry are generally effective in getting rid of these smells. "Cleanliness is next to godliness," says the old proverb; do not neglect it.

A GREAT difference of opinion prevails with respect to the feeding of cows for dairy purposes. Naturally, the milk seller pure and simple regulates his feeding so as to obtain the greatest possible quantity of milk without regard to quality beyond a sufficiency to enable it to satisfy the analyst. The butter-maker or purveyor of cream in the country has to pay more attention to the quality of his milk rather than the quantity, in so far as he desires the greatest possible quantity of both the articles mentioned. How to feed to obtain these different results is a matter that needs not only great scientific knowledge and study, but also with this actual practical, shall we say working, experience which can only be obtained by the closest possible attention to the cows and their performances.

THE feeding of the cattle during the winter or shed season is a very troublesome business, and needs every care, even when the rations are decided upon. To feed simply with mangels or other roots and hay is a very simple and wholesome way for the health of the stock as well as for producing the best produce; on the other hand, sloppy or soft cooked foods usually result in a greater quantity or volume of milk, often of a poorer quality, but the giving to the cows a portion of their artificial food in the way of drinks such as oatmeal or linseed gruel with a little molasses adds very much to both the quantity and quality of the milk, but, on the other side, is not as wholesome or healthy for the cows, and really ought not to be given to breeding cows at all.

CATTLE that are intended to be kept on as a breeding herd year after year should not be fed upon these warm slops; they sap the constitution, and the animals invariably do badly when taken off them. There is nothing like the natural food, sound good hay, cake or corn, and uncooked roots to make the animals healthy and to carry them on in a condition from which they will not shrink when the day comes for turning them out to grass. It occasionally happens, indeed rather frequently, that it is necessary to mix something appetising with the chopped hay or straw, especially when the hay has been badly harvested; a funnel full of boiled linseed or corn meal at such times may be used with the greatest benefit by being poured over the chopped fodder, and will not in any way damage the cattle either for present or future feeding or breeding.

Sale of Lord Rothschild's Jerseys.

A large portion of the first-class herd of Jersey cattle, the property of Lord Rothschild at Tring Park, Hertfordshire, was sold on Tuesday by Messrs. Thornton and Co. The majority of the animals were three, two and one-half years old, which included several well known prize winners,

DEVON BULL, PROUD PINKUN.

Winner of First Prize and Championship at the Royal Show, Derby, this year. Born Jan. 4, 1904, sire Councillor, dam Pink 17th; bred by the late Mr. A. C. Skinner, Pound Farm, Bishop's Lydeard, but is the property of the Hon. E. W. B. Portman, Hestercombe, Taunton.

other societies. For a show of such dimensions to open on Wednesday or Thursday, and to continue till the Tuesday or Wednesday of the following week, practically spoils two weeks' exhibiting for those of our show breeders and feeders who make a point of exhibiting their wares as much as possible, and there is little doubt that it is on this account that so many empty horse stalls are found at that show. The classes would fill much better if the time of opening and closing could be completed in the one week, and four days is quite enough for any exhibitor's valuable animals and expensive servants to be occupied away from home upon such occasions.

THE question of the labour is of as much importance to the breeder as the exhibiting of his animals. No one would think of leaving any but experienced and reliable men in charge of their show cattle for a whole week or more; and how many animals equally valuable may be lost or damaged by neglect or by the need of more skilled attendance in the home herd, which, while the head man is at shows, must of necessity be left to others of less experience. In very large herds it frequently happens that there are two or more men equally competent to take charge of the show contingent or the home herd, but with

some articles of food are prepared, the dairy has a very satisfying touch about it.

IN the eyes of the practical farmer or his wife or daughter, or the dairymaid that has only been accustomed to the rough-and-ready as well as hurried manner of getting through the various processes of milking, separating, churning, &c., the time occupied in carrying out the work in these model show dairies is the greatest drawback to their value as a place of instruction. Many masters and mistresses or home-made (shall we use the term) dairymaids, when watching the slow movements and great amount of time occupied, are led to say: "Oh, I could not afford to be all that time over my work. I expect the butter to be made and the dairy cleaned in such a length of time so that other business can be attended to." Schedules of conditions for the churning competitions might with great benefit be made a little more restrictive in the question of time occupied.

CLEANLINESS in the dairy and all matters connected with it is a point of very vital importance. How much better customers can be obtained for the produce of a dairy where it is known that the most scrupulous attention is paid to the cleanliness of a dairy and of those connected

THE Melton Constable celebrated Herd of Pedigree Tamworth Pigs. Prize winners at Norfolk, Suffolk, and other shows. Champion Cags Smithfield. Several recently exported for Continental and Colonial herds.—**Apply R. OWEN GODDARD**, Estate Office, Melton Constable, Norfolk.

The annual October fair at Donington was held on Wednesday, when good draught horses, for which the fair is noted, were a small show, and the best did not command more than 65 guineas. Sound yearlings or two-year-old colts and fillies realised £20 to £35; foals, bred in the district, £12 to £14 for the best. Business was slow in the cattle fair. Useful two-and-a-half-year-old beasts made £13 to £14; in-calvers heifers, to £16; and cows, to £19.

At a recent meeting of the executive of the Free Importation of Canadian Cattle Association, held in the City Chambers, Glasgow, it was unanimously agreed to convene a general meeting of the association in London, with the object of taking steps to encourage the reintroduction into the House of Commons of Mr. Cairn's Bill in favour of free importation.

Notes and Jottings.

THOSE buying in sheep in these days have not nearly the difficulties that beset their fathers thirty or forty years ago. After the series of dry years which have dried up so many water channels, there is little to worry about concerning liver rot. Scab is being gradually stamped out, and with persistent care ought to become as extinct as hydrophobia; and even if it makes its appearance, the means of checking and getting rid of it are much more simple than when every sheep had to be handled.

FOOT-AND-MOUTH disease is almost a bygone scare, yet thirty years ago a farmer never went to his sheep without feeling anxious that the disease might not have made its appearance, which meant, at any rate, six months keeping for no profit; while when he went to market he never knew whether the sheep were a draft from a flock in which disease had appeared, and the particular lot had been sent out to be got rid of for someone else to have the pleasure of nursing them through the bad time that would soon be coming.

IT is doubtless difficult for many to realise in these days, when the sheep stock has been so improved, that at such a recent period, in even good sheep districts, farmers had to be careful in bringing a pen of sheep to look out for those which still showed traces of the imperfections of the old heath sheep, and would inevitably be unthrifty. With lined cake at £14 per ton, the sheep farmer's difficulties in those days were not imaginary; and when we talk of the good old days we have good reason to be thankful that so much that pertained to them is left behind. At the same time, the man who assumes that sheep farming is a simple business makes a big mistake, for where it is carried on in connection with arable land it calls for as much skill as any section of farming.

IT has been found compulsory to make some sheep keepers dip their sheep as a preventive to scab, and it is well that steps are being taken to make certain skin parties use dips which are effective. It seems incredible that there can be those so foolish in their own interests, or so careless in the interest of others with whom they trade, as to wilfully use inefficient dips; but recent proceedings have shown that such a condition may exist. Considering the trouble and expense being taken to protect foolish people against themselves, such avoidance should be most drastically dealt with.

THERE is little money spent on the farm which is surer in its profitable use than that which is laid out on dipping, and the mixture used represents only a portion of the expense, so that on the ground of saving expense there is nothing to excuse a man. Nor are sellers of effective dips sparing of advertisements, and it is impossible for any one who can read not to have heard of them.

NOW that mangels are being got up, care should be taken in the storing. We often think that undue rotting is taken in some directions, particularly in exactness in taking of the leaves; still the over-care, if a mistake is in the right direction. Where much valuable sheep food is lost is in not taking care to keep out those which are diseased. There has, undoubtedly, been some increase in the diseases affecting mangels within recent years, though on the whole it is a very sound crop.

IT is a great mistake to put these into the heap or clamp, for it is mainly due to them that heat is generated and disease spread. They ought really to be taken away and at once consumed on pastures where there would be little likelihood of their infecting the face and causing a spread of disease in the future. We have stored mangels from most classes of soil, and except where they have been unduly forced, as on sewage-irrigated land, have never known them keep badly if allowed free ventilation at first to get rid of the getting-up sweat. It matters little how they are handled if there are many diseased ones, for these are sure to give trouble—if not immediately after storing, they will do so in the spring when the leaves begin to sprout.

WHEN one gets into what seem to be the more inaccessible districts, one always seems to be running against the Shropshire sheep either pure or crossed, showing what a great range it must have. One meets with it in Scotland in places where one would expect to find local breeds firmly established; on the extreme south-west Welsh coast, and even in not over rich parts of Clure and Galway. As a rule, it is more or less crossed, though by no means always so; but it shows how serviceable the breed is in moist climates. When one gets into the drier climates it is far less frequently met with, and it has never become firmly established in the South of England.

THERE is no doubt that its hill origin in a district with a fairly heavy rainfall has had much to do with this. This is another instance, such as we have before mentioned, showing that climate as well as soil has a big influence on breed, and as such the point should be much more considered by those who buy with the view to instituting breeds in other countries. Those interested in breeds should, when they are trying to get a particular breed taken up, try as far as possible to arrange that the animals are selected not merely on show-yard successes, but on features which have been active in making them what they are. There is no doubt that much harm is done when a breed is sent to an unsuitable climate.

IF the difference between conditions met with in districts not far apart in a country like England are so marked, what may be expected in different parts of countries which in themselves are big enough to be almost continents? We do not often see this point dealt with when breeds are being set forward as suitable for export; but it would be better for the breeds if it were.

Malton Sheep Fair.

There was a good show of breeding sheep at Malton Fair. The best to sell were tupping ewes and gimmer shearlings, both of which were very dear. Some grand Leicester shearlings from Mr. W. D. Megginson, of Towthorpe, York, made 68s. to 74s. each (paid by Mr. Marwood), and some good ewes to 68s. each. Mrs. Weldon's Leicester shearlings made to 71s. each, and Mr. Triffitt's Lincoln to 68s. Young ewes made 55s. to 62s. for quality, and Masham gimmers to 58s. Some high-class Leicester ewes from the Wold farms brought 60s. to 68s. each. Cross-bred shearlings made 45s. to 50s., and ewes to 48s. each. Lambs were not a big show, and they were dear; cross-breds 26s. to 32s., and best pedigree Leicester lambs 38s. to 42s.; secondary, 34s. to 36s. per head. Down and Scotch sheep were scarce. Rams had been nearly all cleared on the first day, and those remaining on hand made £4 to £7, and lambs £2 10s. to £3 10s. per head. Gimmer shearlings and young ewes have not been known to be as dear for some time.

Maidstone Fair.

On Wednesday last this annual fair took place in the county town of Kent, and the entry, which was comprised of about 10,000 head of sheep, besides horses and cattle, was of a quality fully equal to the average. Messrs. Ambrose & Foster and Messrs. Waterman were the principal auctioneers, the first-named firm selling upwards of 7,000 sheep and rams, and the latter about 6,500 sheep and rams. The demand for store things was about the same as we have noted at the other sales and fairs of this district, and from our observations it would appear that practically the whole of those offered would be disposed of. Messrs. Ambrose & Foster have secured the bulk of the rams sold at this fair, and this year their entries included the whole of the Kent or Romney Marsh yearling rams. The demand was not quite so keen as was the case last season, but this arose mainly on account of the absence of the export buyers, and the home buyers being left to themselves, took good care to keep the prices within moderate limit. The leading lots of Kent or Romney Marsh rams were those mentioned below. Several smaller lots and remnants were also disposed of at a low range of prices.

Mr. C. P. Wykenham Martin's rams were of first-class merit, and they sold very cheaply. Here the top price was 14½ guineas to Mr. R. M. Wakeley, a real good ram; others from this lot made 9½ guineas to Mr. Fleming, 9 guineas to Messrs. W. Skinner, Mr. Maxted and Stewart; several made 8½ guineas; Lord Falmouth gave 8 guineas, and the remainder went down to 5½ guineas, with an average of £8 17s. 3d.

Mr. George Farmer, who always sends forward a capital lot, sold better than others, if comparison be made with last year's prices, for this year's average is just about the same, being £8 14s. 9d. for twenty-seven head, with the top price of 12 guineas to Mr. W. Skinner; Lieut.-Colonel Honeyball gave 11½ guineas; Mr. F. Mainwaring 10½ guineas; Mr. Alexander 10 guineas; Lord Falmouth 9½ guineas; and the remainder went at 5½ guineas.

Messrs. J. B. Palmer and J. Robinson averaged

£6 15s. 4d. and £4 16s. 6d. respectively for nine and twelve head.

Mr. P. Powell's nine Southdown yearling rams were in good demand; two made 10 guineas to Mr. P. Champion, and the remainder ranged down to 5 guineas, making an average of £7 11s. 8d.

Lieut.-Colonel W. N. Hammond sold seven yearling Southdowns for an average of £6 8s. 1d.; 9 guineas was the best price.

Several other lots of these sheep were sold, and also some few ram lambs, but in no case, either for these or the Hampshire Down ram lambs, was there any real demand, and so far as regards this part of the sale, the result was one of the most disappointing the vendors have experienced for many years.

VETERINARY.

Advice of a Veterinary character, by an M.R.C.V.S., is offered to Readers entirely free of charge. Particulars of cases should be addressed to the Editor, "MARK LANE EXPRESS," 3, Wellington Street, Strand, London, W.C.

Sweetened Chaff.

SIR,—Will you please give me your opinion of the sample of sweetened chaff which I am sending you by this post as a food for horses, cattle and sheep. It is mixed in the proportion of 3 cwt. of molasses to the ton of chaff, no water added. Do you think this is the best proportion, as the machine with which it is mixed can be varied from half-and-half to 1 cwt. to the ton. The capacity of the machine is about a stone of chaff per minute hand power.

Is such a machine worth £7 to the average farmer? The mixture will not keep many days, please examine at once.

Thanking you in anticipation of a reply.—Yours faithfully,
CHAS. E. HOPSON,
Bourne, Lincolnshire, October 15, 1906.

“* The sample of treacle cut straw came to hand in good condition, and appears in its present state to be perfectly palatable. It is presumably open to the user of the machine to sweeten any long fodder he pleases, but if only straw can be employed, it would not be suitable for feeding to horses, whose chaff should not consist of more than one part of straw, preferably good oat straw, to two parts of hay. Further, treacle is not suitable for working horses. It is fattening, and laxative, and fat is not wanted in horses. With reference to the question “Is such a machine worth £7 to the average farmer?” we should say not, and we doubt if there would be a demand for it even if sold cheaper. Treacle can often be made good use of when roots are scarce, and, if genuine, treacle is good food for hives. The Board of Agriculture leaflet (No. 74) on “The Purchase of Feeding Stuffs” says:—“It (treacle) holds about fifty per cent. of sugar, and consequently has considerable feeding value, and it is much relished by cattle. Mixed with water, and used at the rate of a pound per head per day to moisten chaff, it is a very useful addition to a diet.” A calculation on the basis of a daily allowance of 1 lb. per head for feeding cattle would give you an idea of the proportion of treacle to chaff most suitable. Putting the average daily allowance of hay and straw at from 28 to 30 lb. for large cows, the proportion of treacle can be estimated quite easily. But does the farmer want a machine to impregnate his chaff with treacle, and would he use it? It is admitted that the sweetened chaff or chopped straw “will not keep many days,” and is obviously messy stuff to handle. Nothing could be more simple and expeditious than the method of using treacle generally practised. It is thinned out with hot water, and poured over the chaff as required for use, and few farmers would invest £7 in a machine to do what the fodder man can do in a few minutes with a bucket and a shovel, and without risk of spoiling a lot of chaff. Further, the number of feeders who regularly employ treacle for stock feeding is not large. It is not always possible to obtain the treacle regularly, and sometimes the price is prohibitive. Moreover, there are now in the market several molasses foods which will keep indefinitely, and which are growing in public favour. The man who resorts to treacle feeding occasionally, when the circumstances are special, does not want a machine for mixing it with chaff, and we cannot see how anything of the kind can possibly be a commercial success. M.R.C.V.S.

The Public Health Committee of the Marylebone Borough Council have decided to recommend the council to communicate with the Board of Agriculture, pointing out the urgent necessity of the amendment of the regulations made by the board, so as to provide for the establishment, for the protection of the public, of an absolute standard of milk.

DAIRY.

Chester Dairy Show.

The Cheshire Dairy Farmers' Annual Dairy Show at Chester was held on Tuesday and Wednesday, and in every way sustained its high reputation. The entrance numbered 461, as compared with 441 last year, and with these increased entries the total weight was expected to be close on 100 tons. Actually, it only reached between eighty and ninety tons, the explanation being the obvious one that while there was a greater number of individual cheeses, they were of a smaller size and correspondingly less in weight. Mr. J. Pakeman, J.P., F.R.G.S., of Derby, who is in his thirty-fourth season of judging, and is one of the best authorities in the country, remarked that he had never seen a finer show of Cheshire cheese after a hot summer. The condition throughout was excellent—there being an absence of that wet cheese which has frequently of late years been detrimental to the Cheshire make.

The “blue ribbon” of the association—the gold medal for the best lot of cheese in the show—was awarded to Mr. Henry Denson, of Poulton, a tenant of the Duke of Westminster. They were a lot of four coloured, flaky, rich, mild, good-conditioned handsome cheese, which were exhibited in the “No barbed wire class.” The silver medal went to the same fortunate exhibitor with a coloured lot exhibited in the open classes, which contained no fewer than eighty-eight exhibitors. Mr. Denson has scored former triumphs in the cheese-making art, and previously won the gold medal at this show with a white lot. The “runner-up” lot was Mr. Jos. Jones's, of Doddleston, which was beaten on the vote of the judges on account of being considered not quite so flaky.

The butter exhibits were very good, and the judges singled out three classes—the Channel Islands class, the cottagers' class, and class 15, for occupiers of holdings under fifty acres—as being specially meritorious. “I have never judged finer butter at this show,” one of them remarked. “It is a very high class of butter—good in texture, flavour, and make. The class of butter being made in Cheshire to-day is better than it has been, and these shows are doing a useful work in encouraging that tendency.” The ornamental butter class furnished some clever examples of working butter into the shape of roses and other flowers, and the introduction of the natural leaves and stems produced a realistic effect. Farm produce and honey were small classes, but there was a good show of eggs.

At the cheese fair on the second day there was a combined pitch of about 140 tons, including most of the prize cheeses exhibited at the show. There was a good attendance of buyers, and the fair opened with a sharp demand, the result being that good prices were realised, finest making from 76s. to 80s., one special lot fetching 82s.; medium 70s. to 75s., and lower grades down to 60s. Mr. Denson's gold and silver medal prize cheeses realised from 120s. to 140s., which is £1 higher than the last year's average for the same years, while other first prize lots fetched from 120s., and lots with and without cards from 75s. to 85s.

The Army Meat Question.

A public meeting, held under the auspices of the Leicester Chamber of Agriculture, took place at Leicester on the 13th inst., to protest against the change in the form of army meat contracts, by which soldiers may be supplied with foreign instead of home-fed beef. The Duke of Rutland, who presided, expressed sympathy with the object of the gathering, and said the change made by the Government in a plain and worked well for at least five years would affect farmers, graziers, and butchers throughout the country. The excuses made by Lord Carrington for the proposed change were quite inadequate, and the saving which Mr. Haldane hoped to make would be quite out of proportion to the loss that would be sustained by the agricultural interest. The saving would be at the expense of the soldier. After other speeches the two following resolutions were carried unanimously:—

1. “That this public meeting, held in Leicester on Saturday, October 13, the Lord Lieutenant of the county, His Grace the Duke of Rutland, in the chair, protests in the strongest manner against the change recently made in the army meat tender form, under which contractors can supply foreign meat killed at the port of debarkation instead of native home-bred meat.” 2. “That this meeting also protests against Mr. Haldane's refusal to receive a deputation on the above-mentioned change so seriously affecting their interests from the Leicestershire Chamber of Agriculture, associated in this matter with many other chambers of agriculture and farmers' clubs in England, Scotland, and Wales, and directs its secretary to send them copies of the resolutions as well as to Mr. Haldane, Secretary of State for War.”

Agricultural Conference at Newcastle.

The second annual conference of the North-Eastern Agricultural Federation took place in the Great Hall of Armstrong College, Newcastle, on the 13th inst. Mr. J. Knox Lylly, the president, was in the chair, and there was a large attendance, which included the Right Hon. Earl Carrington, President of the Board of Agriculture and Fisheries.

The secretary first read the annual report, which was most satisfactory as far as work done was concerned, but the financial position is not as strong as it might be, for the income has been only £27 5s., and the expenditure nearly £28, whilst it stated that the payment of a small salary to the secretary would be a need of the future, for the work was both heavy and difficult.

The report referred with satisfaction to the part the federation had taken in Parliamentary matters, and added “the fact that we are at last bringing agricultural interests into the prominence they deserve by speaking with no uncertain voice and with the force of organised agricultural opinion, has given to agriculture, the oldest and still the greatest of industries, something like the same degree of attention and consideration which Governments of the day extend to the other better organised industries.”

The president, moving the adoption of the federation report, said they as farmers wanted no class legislation. They were prepared to take their share of the responsibilities of citizenship and desired liberty to cultivate the land and to make it yield such produce as it was capable of doing.

The report was adopted, and Mr. J. O. Trotter (Bedale) was elected president for the ensuing year.

The Rating System.

Mr. J. Hunter (Newcastle Farmers' Club) moved, and Major R. C. Hedley (secretary Newcastle Farmers' Club) seconded, the following resolution, which was carried unanimously:—“That this federation considers a revision of the rating system is necessary, so that the excessive burden on land may be reduced and all classes of property bear a fair share of local and county expenditure.”

Lord Carrington, in reply, said they were not there to attack any person or class or to advocate any side of politics. They were united in one determination, to do the best they could for the great agricultural interest. Representations had already come to the Board of Agriculture on the subject of the Rating System. It was a terrific question to tackle. All he could say was that the Government was pledged to deal with it on an early opportunity. The first step towards it would, of course, be the reform of the present system of valuation. He was glad that it was not a political question. It was a question which both sides agreed must be tackled fearlessly and fully. It was his duty as their representative in the Government to try to get some relief from the unfair burden of rates which pressed so heavily upon agricultural interests. He would give them his word of honour that he would do his best, and he was not without hope that they would in some way get a proper and satisfactory solution to this great and crying evil.

The Sheep Scab Order.

Mr. J. W. Wilkinson (Hexham Farmers' Protection Association) moved—“That having complied with the Sheep Dipping Order, every farmer should be at liberty to move his sheep without restriction.” The resolution was carried.

Lord Carrington said he was pleased to hear the speakers say that, in their opinion, it was absolutely necessary that sheep scab should be stamped out. He believed they were unanimous about that. But he understood Mr. Trotter to say that the same orders should be put into force all over the country if necessary again. He would make a note of that. In fact he believed there was some idea of that being carried out next year. He should like to point out, though he hated the word, that the Board had had a distinct mandate from the Central Chamber to enforce universal dipping. He would ask them, as fair-minded men, to go through with the order this year. He did not want to prophesy, but he really did hope that in a year or two at the latest they would get rid of this obnoxious restriction. He hoped that next year they would have an order merely requiring universal dipping without any declaration at all. That, he hoped, would to some extent carry out the requests of the resolution, to which he would give his most earnest and respectful consideration.

Game Laws, &c.

With regard to game laws, land tenure, &c., Lord Carrington said he heartily concurred with a resolution submitted. If they would only back him up he felt certain they would be able to produce a state of affairs which, if not perfect and not approved of by all, would be a pronounced improvement upon that which at present existed.

The Milk Supply.

Referring to the present arrangements, satisfactory

ing neither dairy farmers nor the health authorities, Lord Carrington could not say that he could give any opinion on the subject. He would only remind them that the regulations were brought forward by a committee upon which there were representatives from the dairy farmers. He heard the same thing in Scotland. He thought they had great cause for complaint. He would go into the matter thoroughly, and hoped that on some future occasion he would be able to speak with more practical knowledge, and that they would be able to propose a state of things which would be more satisfactory than the present evidently was.

Education in Rural Districts.

Alluding to a resolution as to the necessity of bringing education in rural districts more into line with the requirements of the scholars, his Lordship said all they wanted was more money to carry it into effect. But with the Income-tax at one shilling he would want some of the most resolute of the gentlemen he saw before him to accompany him in a deputation to the Chancellor of the Exchequer and brave his wrath by asking him for any more money at present. He hoped as time went on they would be able to economise and find money to spend, and that they would be fortunate enough to get some of it.

The proceedings then terminated with votes of thanks.

OBITUARY.

Mr. John Garne.

The death is announced of Mr. John Garne, aged eighty-six. He was a brother of the late Mr. Robert Garne, Aldsworth, and for fifty-four years resided at Filkins, near Lechlade, where since 1872 he had a good herd of Shorthorns. It was entirely descended from the Pye tribe, so long associated with the family, and which was brought down from Earl Spencer's herd at Wiseton by Lord Sherborne, about the year 1840. It was kept for practical dairy purposes, but when animals were exhibited at the Oxfordshire and Gloucestershire shows they were generally successful. Owing to Mr. Garne's failing health, he gave up the farm in 1902 and retired to a small occupation at Fulbrook. The herd was dispersed in July of that year, an average of £30 2s. 3d. being obtained for sixty-one head.

Mr. A. Brown.

Mr. Andrew Brown, a well-known agriculturist and dealer in hunters, died at Doncaster last week. Mr. Brown, who farmed about 3,000 acres of land in Yorkshire and Lincolnshire, was, until a year ago, a prominent figure in the prize-ring and a winner at the Royal and County shows, and there were few better judges of a hunter. He was a veterinary surgeon, but did not practice.

Lord Carrington in Oxfordshire.

On Tuesday the President of the Board of Agriculture addressed two meetings at Thame, Oxfordshire, on the Land Tenure Bill. Speaking briefly at a farmers' ordinary, Earl Carrington said that when Sir Henry Campbell-Bannerman gave him his "job" he told him that the Government were going into the land question in real heart, and he did not think they could say that so far as agricultural matters were concerned they had not had a good legislative harvest. But they had only touched the fringe of the question. The great crux of the subject was to give security to the tenant farmer without in any way encroaching upon the undoubted rights and prerogatives of the landlord. The Government had no idea of spoliation or confiscation, and they had no bad feeling against any landlord in the country. All they wanted was to do what was right between man and man. It would not be the slightest good in the world for him to bring forward the Land Tenure Bill in the House of Lords if he had not the tenant farmers behind him. If they left him in the lurch, and said they did not know whether they were in favour of it or not, then the Lords would throw it out. If, on the other hand, they backed him up, and were in earnest, with good luck they would be able to get the Bill through.

Subsequently Lord Carrington addressed a meeting of tenant farmers, and in the course of his speech said that those who described the measure as spoliation or robbery did not know the meaning of the British language. It was a Bill to protect the good tenant against the bad landlord, and the good landlord against the bad tenant. He was told that it would be wrecked in the House of Lords, but he believed that that Chamber would give the measure a patient and fair hearing. It was not the duty of the House of Lords to emasculate or destroy Bills approved by the industry it was hoped to assist.

Lord Heneage and the Land Tenure Bill.

Lord Heneage, who presided at the luncheon in connection with the Shorthorn sale at Kedington Grange, near Louth, on Tuesday, severely criticised the Land Tenure Bill. He said he had seen with the greatest astonishment that Lord Carrington had been agitating in favour of a private members' Bill which they all thought had been sent to the lumber-room. It was an ill-considered, ill-drafted, and bad Bill. He saw the other day that a Lincolnshire deputation had stated that they were generally in favour of the Bill. What in the world did they know about the generalities of the Bill?

Only a few days previously, unless his informa-

tion was at fault, one of the private secretaries to Lord Carrington said it would be inadvisable to discuss any parts of the Bill. He could quite understand that, because many parts of the Bill the Government themselves could not digest. He did not believe there was a man in Lincolnshire who knew what the Bill contained. If there was any principle at all in the Bill it meant dual ownership and land commissioners, as in Ireland. Lord Heneage announced his intention, when the Bill reaches the House of Lords of moving its rejection, in order that more time might be devoted to its discussion another year.

West of Scotland Agricultural College.

The West of Scotland Agricultural College reopened for the session on Wednesday under auspices more favourable than ever before in its history. That history is not a long one, the college having been founded in 1899, but it has been somewhat eventful. The premises first occupied by the college consisted of a suite of rooms in the old buildings of the Technical College, John Street. Later the governors purchased for the sum of £3,450 premises at 6, Blythwood Square, and fitted them at considerable expense for the purposes of the college. The increase in the number of students soon rendered the premises too small, and the chemical department was transferred to the Veterinary College, Buccleuch Street. This arrangement, however, was not satisfactory. Application was made to the Scotch Education Department for a building extension grant, and a sum of £1,500 was given. The Carnegie trustees gave an additional sum of £500 for the same purpose. The extensions have now been completed, and were occupied for the first time on Wednesday.

The opening lecture was delivered by Professor R. Patrick Wright, the principal of the college, who gave "Some Lessons from Denmark." Professor Wright was a member of the Scottish Commission which the summer before last visited Denmark, and which made a special inquiry into the success of small holdings.

Sir William R. Copland, who presided over a good attendance, referred to the excellent work done by the college, the successes of its students, and the high standard which was maintained generally.

A general meeting of the Yorkshire Union of Agricultural Clubs and Chambers of Agriculture, will be held at the Agricultural Club House, Pavement, York, on Thursday next, at 2.30 p.m., when the subjects to be considered include Motor Traffic, the Sheep Dipping Regulations, and the Land Purchase Bill.

HUSK
OR
HOOSE
IN HEIFERS, CALVES & SHEEP

DOSE EARLY — THE ONLY TRUE CURE

DAY, SON & HEWITT'S
BRONCHOLINE
FOR HOUGH MIXTURE
FOR HUSK, HOOSE &c.

SOLD AS FOLLOWS:—
QUART (sufficient for 84 Sheep), 10s. 6d.
HALF-GALLON, 20s. GALLON, £1 18s.
Also sold in Bottles, 2s each, post free.

HUSK
OR
HOOSE
IN HEIFERS, CALVES & SHEEP

No time should be lost in attacking the above fatal disease at the onset, and for this DAY, SON & HEWITT'S "BRONCHOLINE" is without doubt the most effectual medicine extant, if given on first symptoms. It allays Bronchial Irritation, destroys the parasites, soothes the lungs, and gives strength to overcome the malady.

DAY, SON & HEWITT, 22, DORSET ST., BAKER ST., LONDON, W.

AUCTIONEERS, AGENTS.

INVERNESS, WEST HIGHLANDS.—To Noblemen, Gentlemen, Land Agents, Farmers, and Graziers.—**JAMES ARNOTT**, Scotch Live Stock Commission Agent (Estd. 1870), Ellandrum, Inverness, selects and supplies on commission all classes of **SCOTCH STOCK** at lowest rates. Attend leading markets; others receive personal attention. Classes with approximate prices on application; references given and required; terms cash. Telegrams: "Arnett, Inverness." **CATTLE.**—Short-horns, Felled Angus, West Highlanders from the best Herds in Scotland, and direct from their folds, Felled and Horned Crosses, Yorkshire Cows, and Pedigree and Show Cattle of all classes. **SHEEP.** Border Leicester, Cheviot, Black-faced and Crosses, and Pedigree and Show Sheep of all classes. Cattle and Sheep bought throughout the Winter Season.

HIGHLAND CATTLE, SHEEP, AND PONIES.

ANY class of the above can be supplied on short notice and at moderate prices.

ANGUS CAMERON, Live Stock Agent, &c., Fort William, Inverness-shire; or, Taynult, Argyshire.

MISCELLANEOUS.

BASIC SLAG. Percentages phosphates guaranteed; lowest prices to any station; write us to-day.—CANNOCK AGRICULTURAL CO. LTD., (established 50 years), Bone Manure Manufacturers, Cannock, Staffs.

BASIC SLAG, all grades.—Kainit, Supers., Boiled and Dissolved Bones, etc. State quantities required and station, when prices, analyses, etc., will be sent by return of post.—CLEMENT SWAFFIELD, Derby.

POWDER for DESTROYING LICE IN CATTLE and HORSES, and FLEAS and LICE IN DOGS and POULTRY. Sure remedy; simply sprinkled on, no washing; quite harmless, 1s. per lb., over 5 lbs. per free. E. R. RUMSEY & CO., Rhuddall Fawr, Carmarvon.

GYPSUM.—Now is the time to apply 5 cwt. per acre. Marvellous effect on Clovers, &c. 88 per cent. Lime. 14s. per ton, f.o.r. line, bags free.—DERBY PLASTER CO., Ltd., Chellaston, Derby.

RATS! RATS!—A Truro Farmer writes:—"After using a 1/2 Pot of HARRISON'S 'RELIABLE' RAT POISON, I picked up 150 dead rats." Equally good for Rats, Mice, or Moles. Dogs or cats won't touch it. Price 6d., 1s., 2s. 3d., 3s. 8d. Postage 2d.—M. L. HARRISON, Chemist, Broad Street, Reading.

TRACTION ENGINES and WAGONS, Portable, Ploughing, and Fixed Engines, Thrashing Machines, &c., second-hand, for Sale, cheap, or to be Let on Hire-purchase. Full list free. Inquiries for all classes of Machinery solicited. Largest stock in England to be seen at our Works as below. We are also buyers of good modern Engines at all times, for cash, or large stock of Beltings, Oils, and Engineers' Requisites of all descriptions. HENRY LEWIS & SONS, Thames Bank Iron Works, Reading.

POULTRY Houses on Wheels, 7 ft. long, 5 ft. wide, 6 ft. high, nest boxes outside, 65s. carriage paid.—For other sizes write for Catalogue to WHITLOCK BROS., Great Yeldham, Essex.

WATERPROOF COVERS, same material and pliable as railway sheets, 12ft. by 9ft., 12s.; 15ft. by 9ft., 15s.; and so on to any size at 1s. per square yard, with lashes; quantity large pieces tarpaulin at 20s. cwt., odd pieces, suitable for roofing, 8s. per cwt.; cash returned if not approved of.—H. J. GASSON, Government Contractor, Rye.

LOOK!—You have all helped pay for them before! Military Knee Boots, smart appearance, 7s. 6d. per pair; Naval Knee Boots, very strong, 5s. 6d. per pair; Bluchers, 5s. 6d. per pair; any size; carriage paid. Cash returned if not approved of.—From H. J. GASSON, Government Contractor, Rye.

HORSES' LOIN CLOTHS.—Lined throughout with Army Woollen Rugging. Best and strongest in the market, 46ins. long by 33ins. wide. Waterproof on Stout Navy Canvas, and weigh 4lb. 3s. Any size made. Price in proportion. Special Carriage Loin Cloth, 4s. 6d. Either post free. H. J. GASSON, Government Contractor, Rye.

WILLSON'S CANADIAN PIG POWDERS. Packets, 7 Powders, 7d.; 16, 1s. 2d.; boxes, 4s. 14d. 8s., all post free.—STEPHEN WILLSON, Peterborough.

CONTRACT.

LONDON COUNTY LUNATIC ASYLUMS.

CONTRACTS FOR CORNHANDLERY, HAY AND STRAW, BREWERS' GRAINS.

THE ASYLUMS COMMITTEE of the London County Council are prepared to receive TENDERS for the supply from 1st November, 1906, of Cornhandlery, Hay and Straw, for five months to Claybury Asylum, Woodford Bridge, Essex, and Colney Hatch Asylum, New Southgate, Middlesex.

Also for the SUPPLY for 12 months of Fresh Ale Grains to all the London County Asylums, viz.:—

1. Banstead Asylum, near Sutton, Surrey.
2. Bexley Asylum, Bexley, Kent.
3. Canes Hill Asylum, Coulsdon, Surrey.
4. Claybury Asylum, Woodford Bridge, Essex.
5. Colney Hatch Asylum, New Southgate, N.
6. Hanwell Asylum, Hanwell, W.
7. Horton Asylum, Epsom, Surrey.
8. Manor Asylum, Epsom, Surrey.
9. Epileptic Colony, Ewell, Surrey.

Printed forms of tender upon which alone tenders will be received, conditions of contract, and particulars of estimated quantities required, may be obtained at the office of the Asylums Committee, No. 6, Waterloo Place, S.W. Tenders must be delivered at the said office not later than 9.30 a.m. on Thursday, 1st November, 1906.

Persons tendering will be required to declare in their tenders that they pay such rates of wages and observe such hours of labour as are recognised and in practice obtained at the date of the tender by the trade unions of the districts where the work is to be done, and where no trade union exists, such rates of wages and hours of labour as are generally accepted as fair in the trade.

The Asylums Committee do not bind themselves to accept the lowest or any tenders, and reserve to themselves the right to accept such tenders, or part thereof, as they may think fit to select.

H. F. KENZIE,
Clerk of the Asylums Committee.
London Asylums Committee Office,
6, Waterloo Place, S.W.,
13th October, 1906.

SEED WHEAT.

SEED WHEAT.—Webb's Standard Red, direct from Webb's last year; also Pilgrim's Proboscis only once grown, on rich fen land; both strong strawed, good yield varieties. Price, 32s. per qr. of 36 stones, f.o.r., Ramsey.—Apply MAJOR BROS., Ramsey, Hunts.

SEED WHEAT.—Garton Red King. Grown once. Splendid Crop, 36s. 480 lbs., 1s. sacks. Cash with order.—J. GARFORTH, Drighlington.

SEED WHEAT.—Red Standard, Square Head's Master, White Queen Challenge, Stand Up; also Winter Oats, Beans, and Tares. Good samples, low prices.—DALLEY, LIMITED, Agricultural Co-operative Stores, Kidderminster.

SEED WHEAT.—Square Head's Master, grown on good fen land; also Carter's Stand Up White, which grows short straw, not liable to lodge; price 32s. per qr. of 36 st., f.o.r. Hilgay Station, G.E.R.; cash with order or banker's reference required; sample on application.—HORACE J. MARTIN, Littleport.

GARTON'S (new breed) Red King Wheat, cost 65s. direct from Garton's last year. Grown expressly for seed, 38s. per quarter of 50lb. f.o.r., sacks 1s. each, returnable.—MANN & SOXS, Farmers, Twickenham, S.W.

SEED WHEAT for 1906.—Red Fife is accepted by the Millers' Association as the wheat of greatest "strength" ever grown in the United Kingdom.—Price 45s. per qr. f.o.r. in new Sacks.—G. F. YORNG, Swineshead Abbey, Boston.

MISCELLANEOUS.

CATTLE WEIGH-BRIDGE, with removable fence and latest improvements, for Sale, cheap; also wagon weigh-bridge.—LAURIE & Co., 7, Union Passage, Birmingham.

OIL AND GAS ENGINES, 14 h.p. £20; no lamp required. Specially simple, and suitable for all farmer's work. Any size equally cheap. List free.—CLIFFE ENGINE WORKS, Morton, Bingley.

SHEEP Hurdles, 2s. 9d.; Cattle Hurdles, 3s.; Fencing of all descriptions at lowest prices; estimates free; Galvanised Barb Wire, 12s. 9d.; Fencing Wire, 8s. 3d. per cwt.—DAVID & Co., Taff Vale Iron-works, Cardiff.

PEDICURA for HORSES. Cures Thrush, Seedy, Brittle, Shelly Hoof, Foul Smell of Feet, Greasy Hoofs, Itchy Mane, Tail or Legs, Mangy Skin, Fleas, and Lice in all Animals. Price, 2s. 6d.—GREGORY & Co., Temple, Bristol; or through Chemists.

JOHN PRIEST & SON, Ltd., Castle Iron Works, Bristol.

Wire Netting.—Best Galvanised, Cash prices per roll of 50 yds. 3 in. mesh, 2/1, 4s. 5d.; 2 ft., 6s. 1d.; 4 ft., 8s. 1d.; 2 in. mesh, 2/1, 5s. 8d.; 3 ft., 7s. 9d.; 4 ft., 10s. 3d.; 1 in. mesh, 2/1, 9s. 5d.; 3 ft., 13s. 5d.; 4 ft., 17s. 10d. BEST GALVANISED SHEEP NETTING.—50 yard rolls, 3 ft. wide, 4 in. mesh, with centre strand, strong, 10s. 4d.; medium, 9s. 3d. 50 yard roll, strong Slakes, 6s. per cwt. Carriage paid on lot, netting or slakes, 70s. value.

Iron and Steel Hurdles, Fences, Gates.—Excellent quality; 6 ft. hurdles, 4 rails, 30s. per doz.; 5 bars, 30s. Steel fencing wire, 9s. per cwt.; galvanised wire strand, 15s. cwt.; galvanised barbed wire, 13s. cwt., 500 yards. Challenge field gates, 9 ft. by 4 ft., 25s. each. Carriage paid on six gates. Strong sheep fencing, five steel wires and iron posts, 8d. per yard.

Splendid Galvanised Roofing.—Perfect quality, 5 ft., 1s. 5d.; 6 ft., 1s. 8d.; 7 ft., 2s. 3d.; 8 ft., 2s. 8d.; 9 ft., 2s. 8d.; 10 ft., 3s. 2d.; 12 ft., 3s. 2d. per 100 sq. yds. Galvanised Cisterns, corrugated steel, 30 gals., 5s.; 50 gals., 13s. 3d.; 100 gals., 21s. Corn Bins; Sheep Pigs, and Cattle Troughs at very low prices.

J. PRIEST & SON, Ltd., Castle Iron Works, Victoria Road, Bristol.

PUBLICATIONS.

THE NEW ZEALAND FARMER. Bee and Poultry Journal. An illustrated monthly publication, containing practical and scientific information on Farming, Stock Breeding, Cattle, Horses, Sheep, Dairying, Fruit Growing, &c. The only paper entirely devoted to Farming and Stock Breeding throughout the Empire. Price 1s. 1d. by post 1s. 4d. Proprietors, The Press Printing and Publishing Co., Ltd., Auckland. London Manager, R. B. BRETHERTON, 2 and 3, Imperial Buildings, Ludgate Circus, London, E.C.

JEF'S MILK (ACCOUNT) BOOK. For Farmers, for Dairymen, for Consumers. Price 2s., by post, 2s. 3d. Published by W. A. MAY, "Mark Lane Express" Office, 3, Wellington Street, Strand, London, W.C.

Wasted Force.

SINCE the drought broke up rain has fallen heavily everywhere, on manure heaps as well as on the open ground, and it is not an uncommon sight when passing farmyards to observe streams of rich, brown liquor trickling away from the dung hills, and going to make the docks and nettles in adjoining ditches grow more vigorously than they did before. This is a waste of force, and every gallon of liquid manure lost means so much money thrown away. Can it be avoided? Perhaps not in all cases, but in many it might. It is easy to talk about the advantages of covered yards in which the manure can be kept dry and thus retain all its virtues, but there are hundreds of farmers who have not got covered yards and have no chance of possessing them, so they stand to lose something. Still an effort should be made to stop the waste of liquid manure which is the essence of plant food. It is a fine thing to have a tank to catch the liquid drainings from stables and dung heaps; but everyone does not possess this convenience. Nevertheless, we do not like the idea of good liquid manure running into ditches, and by a little contriving it can be run into a hole dug for its reception, and as the latter gets filled let the liquor be carted out and poured on the grass or over the roots of fruit trees in the orchard. There need be no fear about it doing good, and if applied even in the dead of winter the benefits to the plant found in the liquid manure will be seen later on.

The Strength of Unity.

IS agriculture at last awakening to the importance of unity, and are farmers beginning to realise that if they are to be a strong body they must drop their old method of working as units, and join hands for the common weal? Such a state of affairs seems almost too much to hope for, and yet there is a sign in the heavens, for in a recent issue of this journal exhaustive particulars were given of the establishment of the Lincolnshire Farmers' Union. We do not propose here to add anything more to the comments already made on the newly formed union, but our advice to every other county in the country is to do so, and do likewise. We hear enough about the poor representation of agricultural interest at Westminster—we mean farmers not landlords, and we know that farmers have reasons for complaining about this. The day has gone by, however, for the farmer to look to anyone to help him; he must learn to help himself, and we know of no better way of doing it than for the sturdy members of the fraternity to stand shoulder to shoulder, not antagonistic to the landlord, but working, if possible, with him,

because their interests are mutual. Unity is strength, and if every county in Britain had a union strongly supported and fashioned on the lines of that of Lincolnshire, there would be a chance of doing something. It was pitiable at the last general election to see every important industry organised for its own benefit, except agriculture—in our opinion the most important of them all, and for the want of unity its cry was scarcely heard in the turmoil about Education, Tariff Reform, Chinese labour, and other bones of party contention.

Plagues of Wood Pigeons.

EVERY autumn, sooner or later, reports come to hand about the damage done to crops by the hordes of wood pigeons which visit certain districts and swoop down on the fields, spreading devastation right and left. The majority of these birds are aliens, or visitors to our shores, but it is no good putting a Bill before Parliament to prevent their landing. Happily the law does not protect them when they get here, and there is only one means of dealing with the marauders—i.e., co-operation again. What is the good of one farmer here and another there wasting powder and shot in futile attempts to protect himself against thousands of wood pigeons? Such efforts are childish, and the most sensible suggestion we have seen on the subject is that of the Cornwall county farmers' union, which proposes that a combined onslaught should be made on two or three fixed days with the hope of reducing the pigeons. A campaign of this kind was conducted last season by a party of farmers in the Cotswold country, and the result was more beneficial than weeks of desultory shooting on the part of individuals acting alone.

The Care of Drains.

THE other day we happened to be in a field on the lower part of which a large pool of water had accumulated in consequence of the heavy rains. It was suggested that the stoppage of the mouth of a drain was responsible for the flood. Where was the mouth of the drain supposed to be? Nobody knew. In which direction did the drains run? Again nobody knew. Was there any plan of the drainage? There had been one link; it was apparently missing. What an odd story all this is! Time and money are spent in draining land, and for a time all goes well. Then the ditches into which the drains empty are allowed to get filled up, the mouths of the pipes are choked with mud and weeds, and in some cases, when the old hands on the place drop out, the very existence of the drains is forgotten. Of course we have an object in writing this paragraph, and it is to advise looking

after the drains. When a field is drained, let a proper map be made of the system and preserved, and let it afterwards be the duty of someone to see that the mouths of the drains are kept open, so that they can effect the purpose for which they were intended—i.e., the carrying away of superfluous water.

Farm Labourers' Prospects.

IT is a reasonable contention on the part of some persons who know what they are talking about, that young men do not leave farm labour because they are averse to it, but simply because it offers no prospect for the future. There is a good deal in this, and the President of the Board of Agriculture realises it, for he recently observed that no industry could be in a sound condition which did not offer opportunity and encouragement to the small man to improve his position. Just so, and Earl Carrington went on to say that, he looked forward to the day when every agricultural labourer might have a chance of becoming his own master. Does this mean that every agricultural labourer would become his own master if the chance were offered them? Not a bit of it, but probably the best men would, and, unfortunately, it is the best men now who have the hand because it offers so little prospect for their future. Why should not the intelligent labourer live with the reasonable hope of one day getting a small place and being a farmer himself in a little way? Prospect is what men ask for, and they will drift into the occupations which offer it. Hundreds of youths have left farm labour and gone into stuffy sheds to clean engines. Would they do it if they thought they were going to remain cleaners to the end of the chapter? Certainly not; but they know that cleaning is the first and necessary step on the way which leads to a driver's position and a driver's wages. The instance is a typical one, and we feel that the most likely way to keep men on the land is to offer them a prospect there.

The Value of Experiment.

WE are continually receiving reports of experiments conducted by different persons to find out different things, and while some of these do not serve any useful purpose in agriculture, others are extremely valuable. It is not a difficult thing for scientific experiment in agriculture to propound certain theories, but before they can be of any use they have to be proved by experiment. This is strange and surprising, though nevertheless true, that in this great constitution the State should so far not afford to experiment for the benefit of the farmer, and so the work falls on the shoulders of

county authorities, business firms, and private individuals. We have before us reports of experiments conducted with potatoes by Sutton's, of Reading, and on fruit by the Duke of Bedford, but if agricultural research were left to the State it is doubtful if much would be found out. To experiment on a large scale is, of course, expensive work, and frequently attended by loss, but in a small way it is different, and there is no reason why every farmer should not be an experimentalist for his own benefit. It is a good thing to be of an inquiring turn of mind, so long as you confine this tendency to your own business, and in the use of artificial manures, feeding-stuffs, seeds, &c., a farmer may learn a good deal for his own benefit by experimenting in a small way.

October. RAIN fell on the first day of October with us, and it has fallen on nearly every day since. The advent of October and pastures burnt and

brown, with not a blade of grass to be seen; at the close of the month the same pastures are of that vivid green which we connect with the spring rather than the autumn. When October came in there was a general cry out about dried up wells and empty streams. Now the water supply is replenished, and as the month goes out we hear whispers that we have had rain enough and a bit of fine weather would be acceptable. If October has been wet it has been warm, and fruit trees and plants are doing all sorts of topsy turvy things. We saw a man picking plums a short time ago from a second crop of bloom which came after the first was cut off by frost, and it is quite a common thing to see apple and pear trees in blossom. The predominating wild crops just now are blackberries and mushrooms. In the bramble countries the former still hang thickly and fall because people have got tired of picking them, and as for mushrooms, they are such a glut in the market that mushroom gathering has been given up by many as being an unprofitable task.

are still not without influence; but for the moment the passing of the Bill in its present form would mean the buttressing of Radicalism.

The Dilemma of Lord Lansdowne.

Should the Lords reject the Plural Voting Bill? Well, I do not think they will; and for this reason: Then the Radicals who are anxious that they should, in the cant phrase of the hour, "fill up the cup of their iniquity," who are simply feverishly desirous that they should incontinently eject the Plural Voting Bill, the Education Bill, and the Land Tenure Bill, and who even hope that they will mutilate the Workmen's Compensation Bill beyond recognition by its own parents. These Radicals believe that this drastic and rigorous method would operate to the undoing of the Lords. The Marquis of Lansdowne, who may be described as "the real leader of the peers," is too astute and sagacious a Statesman to, by a general attitude which would be represented as mere perverse antagonism to what would be unctuously declared to be "human progress and the rights of the people," put a weapon into the hands of the shouting schismatics. The embers of hatred to the House of Lords as an institution still retain the glow of heat they had, and it would not be difficult to fan it into a flame, not a devouring flame perhaps, but still a flame of unpleasant meane. In what direction, then, will the Lords' amendment proceed? How will the voting-right of property be safeguarded? For the life of me I cannot see. Remember that, according to the dialectical Mr. Herbert Paul, "it is poverty and not wealth which should have the larger number of votes," and this has become the *mot d'ordre* of a considerable section of the Radicals. These Radicals would insist on any concession to property in the House of Lords being fought tooth and nail. Will Lord Lansdowne defy this temper? If he does he will evoke tornados of wrath. If he does not, the electoral position in the counties of Conservatism and of the landlord class will be grimly prejudiced. 'Tis an unpleasant dilemma, and the Government revealed craft in deliberately fashioning it at the outset of its career.

Agricultural Politics.

BY A LOBBYIST.

What the English Land Bill Will Mean.

"An irreducible minimum!" This is Lord Carrington's latest description of the Land Tenure Bill. It is this description which crystallises into a certainty the expectation that the measure is designed to be but a preface. It must not be forgotten that the Bill has never been heralded in Liberal circles as a panacea for the general ills affecting the land. It is held to be but a remedy for economic excrescences which have attached themselves to the laws and usages affecting tenure. Well, this being so, the prospects associated with the future of the Scottish Land Bill attain a more ominous significance. That Bill will not be passed this session. What is more, I doubt that it will be revived in its present character. What is probable is that it will be made the basis of a measure dealing with the whole island, special clauses being grafted on to the new measure dealing with Scotland. It is well to comprehend what such a Bill would mean. It would mean, the utilisation of the financial resources for the State in establishing occupying owners on the land. It would mean the first step—for I assume the same limitations as to the area of the purchased farms would be included in the new measure towards the realisation of Mr. Jesse Collings' ideal, the revival of the yeoman class. It would mean in a great and practical degree, the recognition of the principle of a land court for the establishment of fair rents.

How the Lords Would Strengthen Their Position.

It is well that we should comprehend in this connection the temper of the Liberal party. I was present on Monday at the conference held under the aegis of the Radical-manned Land Law Reform Association, at the Westminster Palace Hotel. One fact stood out in the debate luminous and eminent. This is that the Liberals, be they M.P.'s or be they members of the rank and file, are impatiently eager for some such measure as this. From Lord Carrington and Mr. F. A. Channing, M.P., down to the most inconsequent debater, the Land Tenure Bill was regarded as little more than an anodyne, a mitigant—as only an assuager of an individual ill. How far this temper might be intensified and deepened by the rejection or emasculation of the Bill in the House of Lords is a suggestive matter for speculation. My own view is that if the Tenure Bill be returned to the House of Commons practically intact the more strident legislation may be delayed. The Parliamentary appetite likes a change of diet—the stomach may be satiated by a continuous diet of land reform. Moreover, the House of Lords would then have a legitimate right to insist that the working of the tenure-reform policy should be carefully studied ere taking a leap into an unknown economy, or, rather, ere accepting an economy which, in its Celtic applications, is forbidding rather than fascinating.

Mr. Jesse Collings' Bill and the Radicals.

It is well that we should attune our thoughts to this Parliamentary possibility. I am bound to say that the Radicals have a strategical ad-

vantage in the fact that Mr. Jesse Collings' Purchase of Land Bill is subscribed to by undiluted Conservatives like Sir John Kennaway, Sir John Dorington, and, I believe, Colonel Kenyon Slaney. The measure does not, of course, go so far as many Radicals desire, a fact illustrated by the more emphatic legislative suggestions of Mr. George White; but at least it is in a considerable degree reflects the ambitions which now enthral the Radical heart. You can easily imagine the retort of the Radical politicians to the Conservative pessimist who had hailed the new Land Bill as revolutionary, who had claimed for it that it would mean the throwing of Social order into the crucible of chaos, who had limned down pictures of feckless confusion. "My dear sir," would come the reply, "is Sir John Dorington a modernised Camille Desmoulins? Is Mr. Jesse Collings a modernised Mirabeau? Is Colonel Kenyon Slaney a reincarnation of Robespierre?" Of course the fact that Mr. Jesse Collings' Bill is voluntary in character, and simply proposes to invoke the machinery of the State for the purpose of satisfactorily carrying out an arrangement mutually agreeable to both the landlord and his tenant would be glossed over. If it were recalled at all it would be simply to emphasise the fact that, be the machinery voluntary or inflexible, the Bill definitely proposes that the financial and administrative aid of the State should be utilised in the disposition of the landlords. I don't suppose that Mr. Jesse Collings would be seriously chagrined over this use of his authority as an apology for Radical agrarian schemes. Still, the incident has placed a pretty weapon within the reach of the Radicals; and we may be assured it will not be long ere we see fingers voraciously anxious to clutch it.

Electoral Future of the Counties.

Will the Lords reject the Plural Voting Bill? This is the problem at the moment of writing most concerning the mind of the Commons. One thing is certain—the Government is resolved to permit of no moderation of its desire to secure their ideal of one man, one vote. What is more, it is resolved that a man shall not be permitted to vote in which constituency the party exigencies associated with a bye-election might suggest—he must, indeed, every year definitely declare for which constituency he will vote. Now it is well to confront the meaning of the situation which the passage of the Bill would create. In my view, it means, so far as the counties are concerned, a new lease of power for Radicalism. Cast your eye down the constituencies and estimate how many there are in which a Conservative majority would be assured with the out-voters withdrawn. Probably, Sir Alexander Acland Hood, the chief Conservative Whip, is the most potent political personage in Somersetshire; yet in West Somersetshire he was at the General Election only able to secure a majority of 272. How many would he have secured had he not been able to rely on the out-voters of Taunton and the property votes? It is no use indulging in illusions over the matter. Of course, there might be eventually a restoration of Conservative ascendancy in the counties—territorial ties and family affections

A Friend of Agriculture.

The withdrawal from the House of Commons of Sir Frederick Carne Rasch—fortunately the event is postponed until the next General Election—will mean the withdrawal of one of the most chivalrous, courtly, and vivacious members of that assembly. One may often have disagreed with Sir Frederick's views—one may even have regarded some of them as belonging to the miocene and pliocene order, but no one could ever question his sincerity or denied him his own claim of being the friend of the farming community. There is a refreshing shrewdness and a breezy common-sense about Sir Frederick's Conservatism that has been the death of many a feather-headed project. His antipathy to what he regards as unwise reform has invariably associated with it the salt of so genial a humour that even the victims of his wit have welcomed his happy girdings. Sir Frederick finds the Parliamentary world sadly out of joint; its passion for change and evolution is to him a disease rather than a virtue. Alas! that he should not be ready to fight anew its restlessness, and to baffle its visionary enthusiasms! The House will be the poorer when he withdraws his kindly courtesy, his fragrant humour, and his yester-year faiths from it.

Boroughbridge Cattle Fair, held on Wednesday, was not so well attended as in previous years, and the show of cattle was also below the average. Calving cows made up to £21 8s.; heifers, £16 10s.; and two-year-old bullocks, from £12 8s.; while half-bred ewes sold up to 45s. 6d.

Claim Against a Railway Company.—At the Marylebone County Court on Monday a Southall contractor sued the Great Western Railway Company for the value of a horse, which, he said, was consigned to the defendants at Hungerford in the best of condition, and was delivered to him a carcase. Evidence was called to support the allegation that the horse was not given a sufficiently long halter in the horse box, and that in consequence the injuries to the neck were caused which led to death. For the defence it was submitted that the halter was sufficiently long, and that the railway company could not be held liable, because no negligence had been proved. The jury awarded plaintiff £45, the amount he claimed.

THE HOP SECTION.

A careful examination of the seventy-three samples of English hops confirms the opinion expressed by the chairman of the judges—viz., that a finer range of qualities have never been seen since this competition was established. It is possible that the average colour may have been brighter—that is, the delicate primrose shade may have been more evident; but as this point is of really comparatively little importance, we welcome the ripeness and richness which are the special characteristics of the present display, and congratulate our brewers upon the excellence of the crop thus indicated, and which has been secured by the perseverance and skill of our growers, under circumstances of exceptional difficulty. To attempt to criticise when all are so good, is not only an arduous but also an almost needless task; but we may be allowed to say a few words concerning some of the samples that are worthy of special mention.

The champion sample may be described as "primus inter pares," the first amongst its equals. As it came from Herefordshire it was keenly examined by expert growers, especially those who had hitherto been inclined to think that the south was the natural home of all that is super excellent in the growth of hops. But Mr. Thompson has proved that skill and careful personal attention can accomplish all that the judges desire. There was brightness, wholeness, condition, and flavour

in the sample which secured the unanimous vote of the experts, and we hope that this success may be the forerunner of many similar awards in favour of the district towards which we must admit that old associations induce some kindly feeling. We are informed by the grower that his hops are cured on kilns of ordinary construction, with open fires, the drying is managed by himself, and he considers his success is due mainly to a plentiful supply of air, and the strict regulation of the temperature which is not allowed to rise too high. The cultivation was assisted by Webb's special hop manure. In addition to the honour of the gold medal, Mr. Thompson gains the prize of £10 offered by Messrs. Sydney Myer and Co., of Hereford, in case of the championship coming into the Midland Counties.

In Class 1 (East Kent Holdings), a fine range of samples was shown, and we think the judges must have been somewhat puzzled in their work of adjudication. They placed Mr. G. Mount first, the exors. of G. Whitman second, and Mr. S. Neame third, and the wisdom of their awards cannot be questioned, although we are inclined to think that Mr. W. Lillywhite's splendid sample is equally worthy of recognition.

In Class 2 (Mid-Kents), Messrs. E. A. White, Ltd., are evidently and most deservedly in the first place. The usual high character of this celebrated growth is confirmed in the sample shown, but we cannot help feeling some sympathy for Mr. W. Rogers, whose hops are always well in front, that he is compelled to take an inferior position this time, as his samples are most commendable.

Mr. W. Lillywhite stands first in Class 3 (East and Mid-Kents) with a sample that presents richness, ripeness, and wholeness, the Exors. of G. Whitman being placed second. Of the samples from the Walsd of Kent, which are comprised in

Classes 4 and 5. Mr. Ernest Munington takes both of the first prizes, and in each award the merits of the hops are well justified. The samples were grown with the aid of Hop Guano prepared by the Anglo Continental Guano Works. Messrs. T. and W. Highwood and Mr. J. D. Large have the second positions in these classes, and brewers will be well satisfied with the growths represented by these excellent samples.

Sussex presents only eight samples in Classes 6 and 7, and we cannot avoid expressing regret that Mr. Gilbert Eames has not been selected for an award, as his samples appear to be so full of condition and generally so well managed as to be worthy of favourable notice. The judges have, however, placed Mr. C. Brissenden and Messrs. Ballard and Son in the first places.

Proceeding to Classes 8 and 9 (Worcester and Hereford) we are confronted with a grand show of 18 samples, which, as a whole, were accepted by the observers as the finest range on the boards. The champion is among them, but the samples that attracted most attention were the three grown by Mr. W. E. Pudge, of Bishops Cleeve. It is almost impossible to imagine a more perfect demonstration of scientific hop growing than was here seen. Their absolute wholeness is most remarkable, their condition is of the richest, their ripeness complete, and their colour all that can be desired. They attracted the special attention of every visitor, growers from other districts being so surprised at their perfection that doubts were sometimes expressed as to the possibility of the production of such bulk. But we are assured by the grower that they fairly represent his growth, and from evidence produced to us we are satisfied of the truth of his statement. The judges, however, did not think fit to decide altogether in their favour, having only given Mr. Pudge the second place in Class 8, and the first in Class 9, while one sample, selected by the grower, and by general opinion as the best of the three, was passed over. We understand that failure in flavour was considered to be their only fault, but we were unable to detect that in this important particular they were in any degree deficient. The lower awards in these classes were given to Mr. E. G. Shew and Mr. F. O. Bomford. Other very excellent samples were shown by Mr. W. L. Pritchett, Mr. T. L. Walker, Mr. J. A. Thompson, and Mr. E. G. Shew. The first prizes in Classes 10 and 11 (Farnhams and Country Farnhams) were taken by Messrs. P. and C. Seward for their Goldings and Fuggles, the qualities of which being all that can be desired. Mr. G. W. Duncan took the second prize in Class 10, and other noteworthy samples were those of Mr. G. Langrish and Messrs. Seward.

Amongst the twenty-four samples to which awards were assigned there were twelve that had been grown with the aid of the "Spino" hop and fruit tree wash, manufactured by Messrs. E. A. White, Ltd., the same well-known wash being successfully used in the very trying season we have passed through by the growers of thirty-two out of the seventy-three samples entered for competition. Another notable fact is the increase in the application of hot pure air to the curing of our hops. The Stroczo system was largely in evidence, and four of the prize winners had fitted their kilns with the new system invented and patented by Mr. E. G. Shew, of Bosbury, Hereford, this plant, being automatic and inexpensive, and apparently very effective. In view of the progress in this direction and of the importance of this part of the process of hop production, we would suggest to the Directors of the Exhibition that the system of curing in use by the competitors should be specified in future catalogues.

Apart from the competition, other exhibitors displayed some excellent hops. Messrs. Webb and Sons, Messrs. Jones and Co., Messrs. J. T. Best and Co., and Messrs. Jones Brothers of Northampton, Worcester, were prominent. The last mentioned are extensive growers as well as merchants, and have secured this year an exceptionally large crop by combating the drought of last summer by extensive and regular irrigation, the water being pumped from the River Severn to their gardens through one-and-a-half miles of 3 in. pipes. The whole of their hops which show most excellent qualities, are dried by their own patent system of hot air.

The preservation of hops, which has become of late years a most important feature in the trade, was demonstrated by some samples exhibited by the Burton Pure Ice and Cold Storage Company. These were both yearlings. One had been stored in the ordinary manner, and was brown, and had lost its fine aroma, which was replaced by a strong cheesy smell. The other, stored in a low temperature, retained its freshness and green colour, having the appearance of a new hop, its flavour being as true as life. The system of storage in vacuo was exhibited by Messrs. George Adam and Sons, Bristol. The hops being placed in vacuum-tight cylinders, from which the atmosphere is entirely exhausted, all germs are destroyed, and the hops are kept in perfect condition to an

indefinite period. We were shown samples that had been thus preserved for seven years, which were as fresh in colour and flavour as when they were originally cured.

The exhibit of the E. Clemens Horst Co., of San Francisco, was full of interest by reason of the working model of their elaborate system of curing hops in use in their extensive ranches. They demonstrate that all their hops are cured by natural air alone, the temperature of California being sufficiently high to complete the process without any artificial heat. The drying and baling houses are also automatic in action, the hops being conveyed from point to point by endless bands, so that they are not touched by hand from their arrival from the pickers until their completion in the bales. They claim that as brewers require real brewing value in hops—viz., a combination of strength and aroma—these essential factors are secured, the delicate resins being entirely conserved, and the possibility of under drying or burning being reduced to a negligible point. Analysis shows that hops thus managed contain 23½ per cent. of total resins, of which over 19 per cent. are soft and soluble.

We mention these points that our English farmers may be aware of the competition they have to contend with, and the consequent necessity there is for them to recognise the fact.

CIDER AND PERRY PRIZES.

But slight alteration has been made in the Cider and Perry schedule for this year. With the exception of Class 18—for novices who have never secured a prize at any show—the competition and the rules governing same remain much as before. There are twenty-two classes in all, eight of these being for *bona fide* farmers or owners farming their own land; two classes for cider merchants only; and six for both farmers and merchants. The entries reach a total of 131, and the following were judges: Messrs. Joseph Bennett, Down House, Dursley, Glos.; Frank H. Callingham, Cheapside, E.C.; John Ettle, Weston-super-Mare; W. Gaymer, Attleborough, Norfolk; W. J. Grant, Pentonville, Newport, Mon.; Eldred G. F. Walker, Chew Stoke, Bristol.

Prize List.

Champion Gold Medal.—Messrs. J. Slatter and Co., Paxford, Campden, Glos.; reserve, Mr. F. Ballard, Colwall, Malvern.

Silver Medal (Best Cider, Classes 1 to 8).—Mr. F. Ballard, Colwall, Malvern; reserve, Mr. A. E. Hill, Egleton Court, Ledbury.

Farmers' Classes

(Open to Cornwall, Devon, and Dorset).

Class 1.—Bottles: 1, Mr. F. H. Evans, Littlehampton, Totnes; 2, Sir T. H. H. Amory, Bart., Knightsbridge Court, Tiverton; 3, Messrs. W. Mann and Son, Broadheath, Totnes.

Class 2.—Casks: 2, Mr. F. H. Evans; 3, Messrs. W. Mann and Son.

(Counties of Gloucester, Hereford, Monmouth, and Worcester.)

Class 3.—Bottles: 1, Mr. F. Ballard, Colwall, Malvern; Equal 2, Eardiston Farming Co., Ltd., Stockton, Worcester, and Mr. A. E. Hill, Egleton Court, Ledbury; 3, Mr. John Hazley, The Bury, Stoke Prior, Leominster; h.c. Messrs. Ridler and Son, Cleehonger, Hereford.

Class 4.—Casks: 1, Mr. A. E. Hill. (County of Somerset.)

Class 5.—Bottles: 1, Messrs. Tilley Bros., Shepton Mallet; 2, Mr. H. J. Davis, Sutton Montis, Sparkford; 3, Messrs. D. J. Crofts and Son, Sutton Montis, Sparkford.

Class 6.—Casks: 1, Messrs. D. J. Crofts and Son; 2, Messrs. Tilley Bros.; 3, Mr. H. J. Davis.

Special Apple Class.

For the best collection of cider apples:—1, Mr. A. E. Hill; 2, Mr. H. J. Davis; 3 (equal), Mr. J. Davies, Messrs. D. J. Crofts and Son.

Merchants' Classes

Class 9.—Bottles:—1, Messrs. Tilley Bros.; 2, Messrs. Ridler and Son; r, Messrs. J. Slatter and Co.

Class 10.—Casks: 1, Messrs. W. Mann and Son; 2 (equal), Mr. Thos. Stone, Axe Vale Cider Works, Axminster, Messrs. H. Whiteway and Co., Ltd., Whimpey, Devon; r, Mr. Thos. Stone, Axe Vale Cider Works, Axminster.

Farmers' or Merchants' Classes.

Class 11.—Dry cider bottles: No awards.

Class 12.—Sweet cider bottles: 1, Messrs. J. Slatter and Co.; 2, Messrs. F. F. Woodward and Co.; 3, Sir T. H. H. Amory, Bart.; v.h.c. Mr. A. E. Hill, Eardiston Farming Co., Ltd.; c. Mr. F. Ballard, Mr. T. Stone, Messrs. Tilley Bros.

Class 13.—Dry Perry, bottles: 1, Messrs. F. F. Woodward and Co.; 2 (equal), Mr. F. Ballard, Messrs. J. Slatter and Co.; 3, Eardiston Farming Company, Ltd.

Class 14.—Sweet Perry, bottles: 1 (equal) Messrs. J. Slatter and Co., Mr. F. Ballard; 2 (equal), Mr. T. Shipp, Eardiston Farming Company, Ltd.; v.h.c. Mr. F. Ballard.

Class 15.—No entries.

Class 16.—Cider in bottles containing less than 3 per cent. of alcohol: 1, Quantock Vale Cider Co., Ltd.; 2, Sir T. H. H. Amory, Bart.; r,

Messrs. Tilley Bros.; h.c. Messrs. J. Slatter and Co.

Class 17.—Collection of Cider and Perry: 1, Messrs. J. Slatter and Co.; 2, Mr. T. Stone; r, Messrs. Tilley Bros.

Class 18.—(Novice Class) Cider or Perry: 1, Mr. H. A. Smith, Stow Hill, Newport, Mon.; 2nd, Mr. J. Davies, Malden, Hereford; r, Messrs. G. Hopkins and Son, Ltd., Kidderminster.

Class 21.—Exhibit in connection with Cider Making: Silver medal, Messrs. J. Slatter and Co., Paxford, Campden, Glos. (subject to two of the vent-peggs being sent to judges for a week's testing).

Northern Notes.

THE spirit of co-operation is in the air. From Lincolnshire, Yorkshire, and further north come reports of activity in this connection. This is as it should be. Co-operation is to be the salvation of the British agriculturist. He needs awakening to the spirit of the times, and to a sense of his obligation not only to himself and his family, but he needs to get in touch with the principle of mutuality. What is good for himself is good for his neighbour. One would love to see a more pronounced spirit of brotherhood amongst all classes of farmers, big and little.

A FARMER hearing of something to his advantage in stock buying, in the grain market, or in other departments associated with his business would be a churlish individual if he huffed the "tip" to his breast, and acquainted not his friend and neighbour. There are jealousies in the farming world we should like to see removed, and nothing will tend to that end more than the spread of co-operative principles.

WE have lately asked ourselves whether it is possible that a body composed solely and exclusively of farmers could come to a conclusion that a co-operative system is valueless. A demonstration of this obliquity of view was afforded by a small Yorkshire agricultural club recently. Appealed to by the Yorkshire Union, the members decided against the adoption of a system of co-operation. This decision seems almost incredulous, and one is absolutely forced to the belief that in such instances—which happily are rare—the clubs contain a large admixture of commercial agents and other middlemen, whose glib tongues influence their farmer friends in the wrong direction.

THE assumption of the club in question is contrary to all recent experience. The success of foreign systems of organised agriculture is based on co-operation schemes highly developed in their character. Germany and Denmark are simply saturated with co-operative societies, and the same factors appear in every civilised community except England.

THE evidence in favour of the co-operative principle is overwhelming in quantity, and it has also the merit of being very clear. As a community we are becoming more conscious day by day of the good advantages that must accrue from the acquisition of technical education in relation to farming; and the rising generation who fail to grasp their opportunities may have cause to regret their apathy heretofore. As to the immediate benefit of co-operation, the president of a farmers' club volunteered the statement to the writer, that in the purchase of seed for the use of members a saving of about 33 per cent. was effected, compared with the prices which individual members had been in the habit of paying.

THE terms of the Land Tenure Bill now before Parliament form a fascinating subject for the rural audiences of a politician, although it is difficult to work an audience of this class into a state of enthusiasm apart from a general election. A Radical member in Yorkshire, who had a four figure majority in a rural division last January, was telling his audience this week that the Government is in earnest over the Bill, and that Lord Curzon intends that it shall become law. This Radical member, moreover, intimated that if the House of Lords throw the Bill out—he was certain it would pass the Commons a more drastic measure will be introduced, giving sixty of tenure and setting up a land court for the purpose of adjusting rents.

THERE is a lot of legislation ahead in the farmers' interests if they will only back up the President of the Board, "who might," they have heard it said, "belong to any Government." Farmers must be content to take their reforms from either political party. "A rose by any other name is just as sweet."

October 23, 1906.

CORRESPONDENCE.

A Farming Candidate's Programme.

SIR,—Some little time back, Sir Carne Kaseh, M.P., speaking at an agricultural meeting at Bungay, said:—"If farmers had eighty members in the House who were prepared to stand firmly for agriculture, they would not have to sit smiling as one Government after the other put rats upon rats on the land. Agriculturnists must do something, or they would be wiped out before very long."

And I trust these words will be a warning to all interested in the farming industry, and at the next general election the farming community will be in the happy position to run candidates on the behalf of agriculture pure and simple.

Perhaps the following may give some idea of the programme likely to be adopted by any such candidate:

1. An entire readjustment of the land tax; that is to say, tax the land at its present value. The tax should be a sliding one, as land is very apt to go up and down in value, as the case may be.

2. In case of great distress, municipal bodies should have power to acquire land by purchase as railway companies have, and thus find employment for the genuine agricultural out-of-workers. This would, in my opinion, nullify to a great extent rural depopulation.

3. An Agricultural Holdings Bill is necessary. The Bill would give a tenant security in his holding and compensation for vexatious disturbance.

4. A Pure Beer Bill is absolutely necessary as far as the hop industry is concerned. Beer should be made from malted barley, flavoured with hops. Also, it should be punishable to make beer from any farinaceous grain.

5. An Adulteration Bill is required to prevent the adulteration of butter by fats or any other substances, the adulteration of milk in any form whatsoever, and of margarine by colouring matter.

6. A Road Bill is necessary, seeing that the main roads nowadays are used by motor cars from all parts of the country. The traffic is a national one, and not local as in the days gone by; so, therefore, the cost of the roads should come from the National Exchequer.

7. There should be a measure in urban and rural districts whereby the rates may be equally distributed.

8. Secondary education is of great importance; therefore the cost of the same should fall on the National Exchequer.

Trusting you will find space in your influential paper for this letter, which I hope will give your readers some idea of a farming candidate's programme.—Yours faithfully,

J. H. C. WOODRUFFE.

"Ivy Dew," Longfield Hill, Dartford, Kent.

Insect and Fungus Pests.

SIR,—I do not in the least expect to see the Board of Agriculture scheduling fruit and insect pests and issuing spraying orders. But "West Countryman" seems to agree that it were a consummation devoutly to be wished; and are we to refrain from calling out for a good thing merely because we are not likely to get it? For my part, I think not; and in the last day or so fresh facts have been brought before me which suggest directions in which we might usefully make a start. Perhaps, Sir, since this question seems to be arousing some amount of interest among growers, you can allow me a few lines to point out what they are.

First, there is the circular of the National Fruit Growers' Federation, which deals with American gooseberry mildew, and reached me yesterday. This disease, according to Professor Salmon, occurred for the first time in Europe in Ireland in three gardens. This was in 1900; now it is spread over hundreds of gardens in fourteen counties, and its effects are said to be worse than those of the "big bud" now fast driving the black current out of cultivation. In order to keep England free, the Federation recommends:—(1) Temporary restriction of gooseberry bush imports. (2) "The eradication of the disease in Ireland by the employment of legislative measures similar to those now in force against certain contagious diseases of animals."

Secondly, there is the warning just issued by Professor Collinge, of the University of Birmingham, against the elmworm pest so prevalent in parts of the Midlands this season. "It has been clearly evident for some time past," says Professor Collinge, "that the different species are infecting new areas and rapidly increasing in numbers." Is it too much to demand that the infected land, confined for the most part to well-defined areas, should be so treated during the winter as to afford at least a chance of stamping out these insidious and serious pests before they spread over the whole country?—Yours faithfully,

October 26, 1906.

SEVENSIDE.

The Lincolnshire Farmers' Union and the Land Tenure Bill.

SIR,—Some time ago I was asked to become a member of the Lincolnshire Farmers' Union and consented, feeling that any attempt to combine farmers for the benefit of agriculture should have all the support one could possibly give.

Though I had made it perfectly clear before joining that I had no time to take an active part in the working of the scheme, the members of the union did me the honour to put me on the committee, and I attended one or two of the meetings this year, but was unable to attend a sufficient number of them to enable me to keep in touch with the general aims and working of the union. At one of these meetings at which I was not present, the committee discussed the Land Tenure Bill, and decided to ask Lord Carrington to allow a deputation to wait on him to express its approval of the Bill, and to discuss some other matters. I was informed that I had been selected to form one of this deputation; this came to me as a surprise, as up to that time I had never spoken a word in favour of this Bill to anyone, but had always expressed myself adversely to it. I, of course, declined the invitation; but in spite of this my name has been printed in all papers connected with agriculture as one of those selected to form the said deputation, and owing to this fact I find it is generally supposed that I am a supporter of the Bill. Far from wishing to undermine the Union, I feel the greatest good is to be obtained by such a combination of farmers, and though I am about to criticise some of their proceedings in the matter, I wish it to be clearly understood that I am in sympathy with many of their aims. What I do feel is, that the committee, when acting, did not sufficiently ascertain the general views of the members they represented. It seems to me that they should first have discussed the Bill privately, and exchanged their own views on the matter, and then have ascertained, by vote, the opinion of every individual member of the Union, for on a question of this importance they were not justified, unless supported by a two-thirds majority, in laying their approval of the Bill before Lord Carrington. In doing so the committee misled him by causing him to believe that it represented a majority of the Lincolnshire tenant-farmers. Personally, I do not believe this to be the case, and am anxious to see an opinion taken by individual vote. If the committee is then proved right, Lord Carrington will be fully justified in feeling that he has so important an agricultural county as Lincolnshire at his back. I will go further, and say that had the vote been put to each individual farmer throughout the county, not even 20 per cent. of them would have been found in favour of the Bill. In the interests of all concerned, this subject should surely be fully ventilated and an unbiased opinion obtained, for no one can doubt but that Lord Carrington has the real interests of Agriculture at heart.

As a tenant farmer myself, succeeding father and grandfather, I venture to give an opinion as to what will be the effect of this Bill upon Agriculture in general. It seems to me that with the exception of the clauses having regard to the freedom of cultivation and the sale of all farm products, this Bill would not benefit farmers at all. Moreover, it is unjust to all owners of property, and seeks to benefit one class at the expense of another. I should like to see even more unity than now exists between landlord, tenant, and labourer, although I am proud to say there is, I think, already a greater union and affection existing between these classes than between masters and employees of most trades throughout Great Britain. Long may this state of things continue if we are to preserve the happiness of our country homes and villages, for to prosper we must be a united and not a divided force.

If this Bill should pass in its present form, I am convinced it will be the means of withdrawing capital from the land. For many years our landlords have sunk money in improvements on their estates, and on the whole it is owing to their generosity that a decaying industry has been saved from absolute ruin.

Then, again, take the case of capital invested in mortgages. Put yourself in the position of a trustee having a sum of trust money to invest; you invest on mortgage, the interest is not paid, you as mortgagee foreclose, take over the property and let it. The tenant evicts what buildings he likes, you as trustee are called upon to pay for his improvements, and are in the position of finding the whole of your funds invested in a concern with only partly paid-up capital.

Should this Bill pass, it will be the self-evident duty of every trustee to at once call in his money, and reinvest where there is no such liability.

Now if this be so with regard to trustees, would it not be the landlord's first impulse, on behalf of the younger branches of his family, to take a

similar step, in order to protect their future interests?

We are told that this Bill will not affect other good landlords or tenants, but will that I totally disagree. In the proposal that this Bill I see precisely what I forewarn the passing of the Land, District, and Parish Councils Act. I do not for one moment assert that they have done so good, but they certainly entail a considerable amount of expenditure to obtain a minimum amount of benefit. The expenses of this bill must of necessity be heavy. Where is the money to come from? It must be taken from the soil (the raw material, which is now greatly overtaxed, in order to give it to the farmer). The proposal to make a large leakage in the shape of expenditure; moreover, it will destroy confidence and friendship, and the result will be disastrous failure. I fully concede that there may be cases in which this bill would prove a boon to a good tenant under a bad landlord, but the good which would accrue to the few would be far outweighed by the disadvantage to the many. Now I want to be fully understood that I am not condemning the bill as a whole.

As far as the freedom of cropping and the sale of produce is concerned, I fully agree with the bill; but I believe, if farmers could speak out frankly, they could obtain this without an Act of Parliament.

Years ago we had difficulty in finding a market for hay, straw, &c., on account of the lack of means of transit, neither had that knowledge of the use of artificial manures which we now possess. We are now in competition as a nation with the whole of the world, and if we are to succeed in holding our own we must bring our knowledge to bear on the subject. The same thing applies to the course of cropping; we must grow what pays best. It is no answer for the landlord to say that if he allows this change he will have his land impoverished, or that he has no means of knowing that a proper amount of artificial manure is returned to the land. If the landlord has a competent agent he should know how the land is being farmed.

These are not days for agents to merely sit in offices and collect rents. They are days of keenest competition, and if the tenant farmer is to be up to date and use increased energy, the agent must be the same, and possess a full knowledge of the estate he is working. For example, take the Earl of Rosebery's Scotch estate, and see the advantage derived there by the advice of a practical agent to the tenantry.

Possessing a rather exceptionally wide experience in agricultural matters, I may say that in my opinion one of the principal ways in which the present Government can assist Agriculture to any great extent is by the relief of local taxation. I have taken every opportunity of expressing my views upon its injustice. The land of this country is heavily and unfairly taxed, and it is the duty of right-minded Englishmen to insist upon the reduction of these taxes. It is monstrously unfair that in country districts public expenditure should to such a large extent be borne by the land.—I am, yours faithfully,

ARTHUR W. DEAN.

Dowsby Hall, Bourne, Lincs., October 26, 1906.

Farmers and the Board of Agriculture.

SIR,—By far the most unsatisfactory subject to farmers at present is the action of the Board of Agriculture with its absurd sheep scab orders and regulations, which are universally condemned in the counties of Cumberland and Westmorland. If a vote could be taken I believe it would go for the abolition of the board, for although Lord Carrington may be anxious to befriended the farmers, I feel certain it will not accomplish what he craves for, that of bringing population back to the land. He is evidently a fatalist, and not the only one who at present presides over the general welfare of the country. T. B.

October 24, 1906.

Hay Sale at Haverhill.—The first of what is intended to be an annual auction sale of hay at Haverhill by Mr. C. Boardman took place on Monday, and proved most successful. The buyers were met at the station and driven to the various farms. Bowler Hall Park, Steple Bumpstead, was first visited, and there a large stack of upland hay (1904) sold for £117 10s., and another of 1905 produce made £123, whilst a stump of upland hay fetched £13. Then Baythorne Lodge, Kettlewell, was visited, and there two stacks of moorland hay realised £50 and £32; a stack of straw and timothy, £70, and a stack of hay, linseed, and sainfoin, £21. At Preston's Farm, Kettlewell, a stack of sainfoin and stover found a purchaser at £20; at Hazelstub Farm, Haverhill, a stack of upland meadow hay sold for £45, and a stack of freestone clover brought £73; a stack of 1800 lb. of upland Hazelstub Farm realised £18, and a stack of second cut clover was knocked down at £30; stacks of moorland hay and linseed respectively reached £32 10s. and £30; while £23 was the price obtained for a stack of cut and whole straw.

POULTRY.

The Utility Poultry Club's Com- petition.

On Monday last the Utility Poultry Club's
tenth annual laying competition began in earnest
at Rayne, Essex. The birds were given over a
week to recover from the effects of their railway
journey, and that they desired this period of rest
was proved by the fact that the 160 fowls (which
are divided into pens of four each) did not lay
more than two dozen eggs between them in that
time.

On Monday, however, the birds were put on
their trial, and, appropriately enough, the first
egg was found in the nest of No. 1. Mr. Richard-
son, the hon. secretary of the club, under whose
management the competition is being held, col-
lects, weighs, tabulates, and registers every egg
laid by the hens, and so that there can be no
mistake as to which hen laid the egg, each egg is
laid in a trap-nest and is numbered to correspond
with the figure on the hen's foot.

In view of the difference of opinion as to the
relative merits of the scratching shed and colony
systems, and for greater convenience, the Club
decided to divide this year's competition into two
sections, providing accommodation for twenty
pens in each section. The birds in one section are
confined to scratching sheds without runs, and
those in the other section in the ordinary portable
house with grass runs.

The results of these two sections will be com-
pared with interest by breeders in all parts of the
country, but they will have to wait for them in
patience, for the competition does not close until
February 10 next, thus extending over four
months.

The birds are uniformly fed, and no condi-
ments or spice will be allowed, whilst the points
to be given are three for every egg weighing 2 oz.
or over, two points if 1½ oz. and less than 2 oz., and
one point if less than 1½ oz. Hitherto any egg
weighing over 1½ oz. scored two points only.

A number of prizes and specials are being offered
—including the Tamlin Silver Cup—and these are
supplemented by the Gold and Silver Medal and
the first and Second Class Certificates of the Club,
should the standard reached be sufficiently high,
whilst the secretary has offered a prize for every
pen of four birds beating the record of 276 eggs,
so that the hens have something worth working
for.

The Departmental Committee on Small Hold-
ings is now engaged in the consideration of the
report drafted by the Earl of Onslow as chairman
of the committee.

Rotherfield (Sussex) Fair attracted a good
attendance, but business was very dull, and in
the open market but few cattle changed hands.
At the auction sale bullocks from twelve to twenty
months old made from £5 to £10.

Alleged Sheep Stealing.—An extraordinary
case of alleged sheep stealing has been before the
Quarter Sessions at Ipswich for three days.
Frederick Cook, a farmer, and James Runnby, a
labourer, were charged with stealing forty-nine
lambs belonging to Robert Hawes, a farmer. The
party lived at Sturminster Newton, Dorsetshire, and
the case for the prosecution was that on the night
of July 21 the defendants drove fifty inferior
lambs a distance of more than three miles, to
Hawes's farm, and, leaving them behind, took
away forty-nine far better lambs from a flock of
140. The accused denied the charge, and, among
other evidence, called a witness to say that, what
their counsel described as a miraculous bit of
work, could not have been effected in the time by
two men. Three lambs were produced in court
for purposes of identification. After deliberating
for more than an hour, the foreman of the jury
announced that they could not agree, and the
case was remitted to the assizes.

WE MAKE GUNS

We sell to the user with only one small profit.
We sell for cash direct to the user.
We buy the finest materials to be obtained.
We pay cash for all materials.
We employ some of the finest workmen in the Gun Trade.
We use finest machinery for machine operations.

RESULT.

We sell for £25 Guns of a quality for which sportsmen have previously paid from £50 to £80.

We sell thoroughly reliable Guns.

We get the finest shooting it is possible for guns to make.

Our "Field" Hammerless Ejector Gun. — A perfect Ejector Gun of the finest quality, £25. It made with the best single trigger mechanism ever invented, £39. A perfect pair of these Guns, beautifully matched, £50. A perfect pair of Single Trigger Guns, £60.

"The Gun of the Future," as an Ejector, £15. "The Gun of the Future," without Ejector, £10. A sound and reliable gun, well made, and perfectly balanced, which will give entire satisfaction.

Pattern 8662, £6. — A sound and reliable hard shooting and hard wearing hammerless gun. Better than many sold at double the price.

Pattern 8368, £4. — A sound and reliable hard shooting and hard wearing hammer gun. Better than many sold at double the price.

ESTABLISHED 20 YEARS.

PRICE STREET, BIRMINGHAM.

Midland Notes.

SOME day, perhaps, people will cease to cry out against the British farmer for his unwillingness to try co-operation. The reproach was true enough once, but it is rapidly ceasing to be so; in fact, there are very few industries now which are anything like so well organised as agriculture.

WORCESTERSHIRE was one of the first counties to set an example in this respect, and for some years past Warwickshire and Staffordshire have both boasted farmers' associations which have done capital work for their members. The recent activity among milk producers who supply the Birmingham market has been already noted in this column, and even that is but one aspect of a larger movement. Lately the agents of the farmers' associations have been very busy in the country districts which supply Wolverhampton and other large centres, and by all accounts big schemes are in the air. There is a disposition, indeed, not to be content with struggling with the dealers for trifling improvements in selling prices, but to adopt the bolder course of setting up town depots and retailing without calling in the help of the middleman at all. Well, we shall see what we shall see.

MEANWHILE, a Nottingham friend gives me a cheery account of the latest co-operative movement there. In this case it is proposed to tackle the difficult question of milk supply yet awhile, and doubtless it is wiser to wait a year or so until the association can accumulate funds enough to work upon more comfortably and efficiently than it could possibly do at present. In the interim it will more than justify its existence by enabling local cultivators of land to buy feeding stuffs, manures, implements, &c., at wholesale prices. It is significant of the practical part which the agricultural colleges are playing now days, that Professor J. F. Blackshaw, the Principal of the Dairy Institute at King'ston, Derby, is one of the organisers, and is acting as joint honorary secretary of the new movement.

WHICH reminds me of an incident on the other side of the Midlands, in connection with the Harper Adams College, in which our friends of Staffordshire and Salop are so interested. It is not long since a large party—perhaps 100 or more—representing the Shropshire Chamber of Agriculture visited and inspected the large experimental farm and laboratories at Newport. Now the visitors have sent to the Shropshire education authority a formal expression of their appreciation of the work which is being carried on at the college to assist the agriculture of the county. No one who knows the west Midlands could doubt that their formal thanks are also sincere, for the Harper Adams College furnishes an excellent example of the good influence which can be exercised by such an institution in the district where it is situated.

WE are but a week from dear November, yet trees and hedgerows are still clad in thick and healthy foliage, while grass, mixed seed, and early sown crops flourish as though in spring. So, too, do the roots, which there is much temptation to leave late in the ground, albeit we all know the risk of it, and the additional weight is represented mostly by water and woody fibre. Mangels are being lifted now in favourable circumstances, but after the roots have once been touched by frost they need more careful handling, and in the ordinary course of events the crop should all be carted and clamped within the next few days.

THE question of housing dairy cattle now comes up again, but fortified by the results of the Harper Adams College experiments, an increasing number of stock owners prefer to keep milk kine out in the fields as late as possible. Here is a case where scientific experiment justifies old practice, both agreeing to show that in spite of mistaken humanitarian scruples beasts thrive better when lying out through the cold nights than when tied up under cover. Only, of course, their diet must be generous, with a due proportion of dry fodder and more or less oily concentrated food.

THERE is no such superabundance of apples this season as there was in 1904, when cider-makers were often hard put to it to find sufficiency of casks, but it is very far from being a bad year, and nowadays an increasing proportion of our cider is being made in a more or less scientific and up-to-date way, instead of by the old haphazard rule of thumb methods, which were so uncertain in their results.

October 25, 1906.

The President of the Board of Agriculture and Fisheries has appointed Professor Thomas Hudson Middleton, M.A., M.Sc., to be an Assistant Secretary to the Board, in the place of Dr. W. Somerville, resigned.

Fertilisers and Feeding Stuffs.

USEFUL INFORMATION FOR FARMERS WHEN BUYING.

Approximate Unit Cost of Fertilising Constituents.

It is necessary for guidance in the economical use of fertilisers, and especially in the purchase of Complete and Special Manures, that the relative unit cost of the principal fertilising constituents should be studied: the subjoined table affords information on the subject. By multiplying the guaranteed minimum percentages of a fertiliser by the unit costs given in the table, the buyer will get a good idea of the commercial value of any chemical manure offered to him. The unit values are subject to variations from time to time, and in this respect we shall endeavour to keep the table up to date, besides which, buyers living in remote districts may have to pay a little more for heavier cost of delivery. If credit is required, this will also add to the cost.

	Peruvian Guano.			Nitrate of Soda.	Sulphate of Ammonia.	Bone Meal.	Super-phosphate.	Basic Slag.	Bone Compounds.	Special Manures.	Kainit.	Sulphate of Potash.	Muriate of Potash.
	Raw or Equivalised.	Phosphatic.	Dissolved (soluble).										
Ammonia, organic as in Guano and Bones	s. d. 15 0	s. d. 12 6	s. d. 15 0	s. d. —	s. d. —	s. d. 12 6	s. d. —	s. d. —	s. d. 15 0	s. d. 15 0	s. d. —	s. d. —	s. d. —
„ in Sulphate of Ammonia	—	—	—	—	10 6	—	—	—	—	12 6	—	—	—
„ calculated from Nitrogen in Nitrate of Soda	—	—	—	12 0	—	—	—	—	—	—	—	—	—
Phosphate soluble in water	2 0	—	2 0	—	—	—	1/10-2/	—	2 0	2 0	—	—	—
„ assimilable	1 3	1 2	1 3	—	—	1 2	—	—	1 3	1 3	—	—	—
„ insoluble	—	—	—	—	—	—	—	1 3	—	—	—	—	—
Potash (pure)	4 0	4 0	4 0	—	—	—	—	—	—	4 0	3 10	4 0	3 10

N.B.—The above table is based on the commercial cost of the fertilising constituents. Agricultural value is not always synonymous with the commercial cost, and every farmer must exercise his judgment, while considering the cost, which fertiliser may be expected to give the most profitable return on his soil and for his crops. This is the cheapest manure for him.

Approximate Unit Cost of the Nutritive Constituents in Feeding Cakes and Meals.

Cakes and other Feeding Stuffs.—In order to be able to form a correct opinion of their value, it is necessary to know the relative cost of the different nutritive constituents. The following note, by an eminent authority, supplies this information. By reference to it, a farmer can calculate out the approximate commercial value of a cake or meal, and then use his judgment as to which is most suitable for his special requirements.

	s. d.	s. d.
Albuminoids	2 8	3 0
Oil or fat	2 8	3 0
Carbohydrates	1 1	1 2

Note.—Most authorities in England are agreed that the value of each per cent. or unit of albuminoids and of oil is at least 2½ times that of 1 per cent. or unit of carbohydrates. If, therefore, the percentages of albuminoids and oil in a feeding stuff be respectively multiplied by 2½ and added to the percentage of carbohydrates, the total feeding units contained in the article are obtained. The cost of the feeding stuff divided by this total of feeding units gives the price per unit. Example: A cotton cake contained

	Per cent.	Feeding units.
Albuminoids	22.1	× 2½ = 55.2
Oil	5.2	× 2½ = 13.0
Carbohydrates	33.2	× 1 = 33.2
Total feeding units		101.4

The price of the cake being £5 7s. 6d., the cost per feeding unit was just about 1s.

Note to Regular Subscribers.

We may remind our readers that we are prepared to analyse free of cost for our regular subscribers, who are farmers, and not in trade as vendors of fertilisers or feeding stuffs, samples of minimum lots of 2 tons of either article, in cases where there is solid reason to suspect an attempt to defraud. The analyses are published, under a *nom de plume*, in the paper.

We are also willing to publish replies in these columns to inquiries relating to the quality and use of fertilisers and feeding stuffs.

Moss Litter.

Both straw and moss litter possess the property of absorbing and thus preserving the valuable fertilising material in animal excretions, but it would appear from experiments that the absorptive power of moss litter is much greater than that of straw. It pays to buy a good quality of moss litter, and it should be well broken up when spread as litter, as lumps do not take up the liquid manure.

When applied to swedes, it has been found that 12 tons of moss litter dung produced over 25 tons of roots per acre, whereas an equal quantity of straw dung gave about 2 tons of roots less. Moss-litter dung would appear to be quicker in action than ordinary farmyard manure, and therefore capable of producing better results on quick-growing crops. It should be noted that moss-litter dung should be applied in a moist state to the soil, as if dry it brings about a dry condition of the soil, which would do harm in a dry season.

Soil Preparation.

We must continually bear in mind that in order to raise good crops we must see that the soil is properly prepared as a seed bed. The better the condition of the soil, the better chance has the crop of growing luxuriantly. Gardens produce more than fields, chiefly because the small area of soil enables them to be more worked, and the condition of arable land should be made as nearly as possible to resemble the condition of a garden.

Applying Farmyard Manure.

When farmyard manure is carted from the heap to the field, it is best, if possible, to distribute it over the land without delay, and care should be taken to spread it evenly. Very often the manure before being distributed over the field is arranged in small heaps at little distances apart; in such cases it should not be allowed to remain in the heaps, but should be spread without delay, otherwise the manure will drain, with the consequence that some patches will be over-manured, and the rest of the field will suffer proportionately. The best part of the manure drains out, so that the greater part of the field gets a supply of impoverished manure.

Sometimes, in order to save carting in the spring, the manure is carted out in the late autumn or winter and piled in large heaps in the field. This may be a convenient practice, but involves the risk of considerable loss during storage, unless precautions are taken. The heaps should be deposited on firm, level ground in the field, and should be made deep and firm; they should also be covered with a good layer of soil to prevent evaporation of ammonia and to allow the rain water to run off.

In applying farmyard manure, it is found that moderate dressings, say, of 10 tons to the acre, supplemented with artificials, yields a better result than the large dressings of 20 tons which are often given, and it has the great advantage of increasing the area over which the farmyard manure is applied.

It must always be remembered that nothing can replace the beneficial action of the farmyard manure, although moderate dressings will suffice. The organic matter in the manure gives activity to the bacterial action in the soil in a way that nothing else will.

The crops that benefit most from applications of farmyard are potatoes and root crops; meadows and pastures should also have a dressing every three or four years, with applications of phosphate of lime and potash in the intervening seasons.

Farmyard manure is a very valuable material, as old-fashioned farmers rightly say, "muck is the mother of money," and everything should be done to avoid its waste and loss.

Varieties of Barley.

In 1905 a set of trials were carried out in Lincolnshire by the Midland Agricultural College, having as their object:—

1. To find which variety gives the largest yield per acre.
2. To ascertain which variety gives the highest total money value per acre.
3. To compare the yields on the different soils and with different situations, and to note which varieties withstand the beating of storms without becoming laid.

The trials were conducted at two centres, viz:— at Mareham-le-Fen, where the soil is described as being of a light, warm character, and at High Tooton, described as a high exposed situation, with soil of a heavier nature.

The varieties tested were:—Chevalier (Archer's), Chevalier (Hallett's), Chevalier (Webb's Kinver), Goldthorpe, Hanna (Proskowetz's), Invincible.

The report contains full details of the experiment, the final conclusions being summarised as follows:—

1. Hanna and Archer's Chevalier gave the greatest money-value return per acre.
2. Goldthorpe and Invincible produced the best quality of grain.
3. Hanna produced the best quality of straw.
4. Hanna ripened the first.
5. Hanna showed the least tendency to layering.

Protection of Seed Against Rooks.

A short time ago there was considerable correspondence in the agricultural Press on the subject of rooks. It was strongly urged by some writers, that, in view of the serious injury caused by them to the young crops, they should be ruthlessly destroyed; by others it was argued that the good work done by them in the destruction of wire worms and grub compensated for their other misdeeds, and that the balance of Nature should not be upset by their extermination. The latter view is, probably, the more correct. Rooks in limited numbers may be regarded as useful servants; besides, it is not difficult to protect the seed against their depredations. The employment of coal tar is practised for this purpose with success. A solution of 2½ oz. coal tar, 2½ oz. petrolum, mixed with one quart of water per bushel of wheat can be recommended.

The following similar treatment is adopted on a large farm in France, where the treated wheat escapes damage, although serious injury is caused by crows to neighbouring fields notwithstanding the fact that the birds are continually being scared.

The solution is made as follows:—1½ pints of coal tar, 5½ pints of petrolum, 1½ pints of carbolic acid, to 5 gr. (of 480 lb.) of seed.

The proportions named should be strictly adhered to in order to obtain successful results. Commercial carbolic acid of full strength must be

used. The mixture should be made as follows:—Place the coal tar in a pot on a slow fire until it is quite hot and shows signs of boiling, remove it from the fire and add the petrolum while stirring, and finally the carbolic acid. The mixture should be thoroughly well stirred, and it will remain quite liquid after cooling.

In order to treat the grain about 4 bushels of seed should be spread out on a water-tight floor, and a tenth part of the mixture, which will be a little less than two pints, poured on it. This must then be stirred up quickly till each grain is blackened and the whole is about the colour of roasted coffee. Continue in the same way, dealing with about 4 bushels at a time.

The seed cannot, however, be sown in this condition, as it would stick to the cups of the drill, and in order to remedy this add to each 4 bushels of seed about 2 pints of phosphate of lime. When mixed, the grain will be completely dry, and can be sown in the ordinary way. Seed treated in this way will not be touched by crows, though the growth may be retarded by some two or three days. The cost per bushel would be insignificant.

Production of Pyrites for the Manufacture of Sulphuric Acid.

According to *L'Engrais*, Portugal leads as a producer of pyrites. It gives a table of production per country as follows:—Portugal, 377,000 tons; Spain, 262,000 tons; France, 272,000 tons;

United States, 237,000 tons; Germany, 175,000 tons; Norway, 130,000 tons; Italy, 112,000 tons; Hungary, 97,000 tons; Newfoundland, 42,000 tons; Canada, 30,000 tons; Russia, 20,000 tons; Japan, 16,000 tons; England, 10,000 tons; Switzerland, 8,000 tons; and Belgium, 1,000 tons.

Price of Fertilisers.

As the season for the purchase of fertilisers is now at hand, we shall give weekly for the next few months the London prices of the principal articles.

The quotations will be approximate, as in some cases where large quantities are concerned and carriage is convenient, a buyer may be able to buy a little cheaper, and in other cases where delivery is inconvenient he may have to pay somewhat more:—

Nitrate of soda	 prompt delivery	£ s. d.
	11 17 6	
Sulphate of ammonia	 forward	12 2 6
Superphosphate 26 per cent		2 10 0
	33	3 6 3
Pure dissolved bones		5 5 0
Bone compound ordinary		3 6 3
Ground hoof, 15 per cent.		9 19 0
Fish guano		5 7 6
Kainit		2 5 0
Sulphate of potash		10 0 0
Muriate of potash		9 0 0

BIBBY'S "CREAM EQUIVALENT" MEAL

FOR
CALF-REARING.

Our Agents are continually hearing some such remarks as: "I want you to send me two more bags of that 'Cream Equivalent' Meal. It is fine stuff, and I should like you to see my weanling calves; they are a splendid lot—a perfect show."

We like to hear talk like this, and do not wish for a better advertisement of this Meal than these "Cream Equivalent" reared calves are all over the country.

It is quite easy to prepare. It swells out into a fine creamy substance, the calves are fond of it, and there is no scour.

When the calves begin to eat, we recommend a little dry feeding—a mixture of "Bibby" Cake, Oats and Bran is particularly suitable, the former being at once nutritious and digestible; and calves so reared are always one of the sights of the farm, and make fine well-grown heifers with nice loose skins and plenty of good hair.

One cwt., costing 15/6, carriage paid, is enough for two calves. It costs about 1/3 more to rear a calf on "Cream Equivalent" than on the cheaper calf foods, while the difference in value of the grown animal is marked, both as to condition, health, and growth.

It is the most soluble Calf Meal on the market, and can be made up simply by soaking the meal in cold water for six or seven hours, if this suits the feeder's convenience better than by making up with boiling water in the ordinary way.

If you are interested in this subject, write for our new circular, "How to Rear Calves for the Dairy." It will be sent free of cost to any address on receipt of postcard.

SINCE THE PROLONGED DROUGHT AND MILK FAMINE

Hundreds of Farmers in the West of England are keeping up their Milk Supply by using our DAIRY CAKENUTS on burnt-up pastures.

When once used in this new form, the advantages are so apparent that the British Farmer would as soon think of going back to the old Kibbler as he would think of reverting to the old method of reaping his corn with a sickle.

CAKENUTS save time and labour and prevent loss in waste and dust.

All these things mean "money," and money saved is money earned.

Pond's EXTRACT

Veterinary Remedies

RANSOMES' ROTARY POTATO DIGGER

IS THE DIGGER FOR 1906.

Special:—

Awarded the
FIRST & HIGHEST PRIZE (£20)
by the Royal Lancashire Society at
the great Burscough Trials,
October, 1902,
OPEN TO ALL THE WORLD,
since when no important competi-
tions have been held.

Advantages:—

**LIGHT DRAUGHT.
CLEAN DIGGING.
SIMPLE, EFFECTIVE &
RAPID ADJUSTMENTS.
BRUISING AVOIDED.
GATHERING FACILITATED.**

RANSOMES, SIMS & JEFFERIES, LTD., IPSWICH.

Appointed by Royal Warrant Manufacturers of Agricultural Machinery to H.M. King Edward VII.

BREWERS' EXHIBITION, LONDON.

THE CHAMPION BARLEY

1896-1900-1903-1905 was grown with

FISONS' (IPSWICH) FERTILIZERS.

JOSEPH FISON & CO., Ltd, IPSWICH.

Advertisements, Subscriptions, and business communications should be addressed to THE PUBLISHER, "Mark Lane Express," 8, Wellington Street, Strand, London, W.C.

AUTUMN WHEAT-SOWINGS.

Clay-land occupiers have been remarkably busy during the past fortnight drilling seed-corn. Seldom if ever have weather and the land favoured them more beneficently in October. The condition of things is all the more enjoyable as the two previous months made it to be almost impossible for plough-shares to penetrate the adamant ground, and until the advent of the present month there could be no autumn culture worthy of the name on a large section of the very heaviest soils.

Of course when a large portion of the early autumn has this character, however fine the latter part may prove, only those clay land farmers who have steam tackle, or can hire it, overtake work thoroughly. But this does not affect wheat-sowing so much as some other things. Farmers in modern times do not, as a rule, sow wheat until October, although it appears, according to Arthur Young's Calendar, they were in the habit of doing so at the early part of last century. He wrote therein:—"Upon all cold, wet, backward soils, September is the best

season for putting in wheat, provided circumstances permit it. Wheat should not be sown until rain comes in tolerable plenty, and never in a dry season. Upon drier and warmer soils it is better to postpone the business until October."

Very few soils would have been found damp enough in September this year to have been at all in proper condition, even though the usual period of sowing had remained the same. That it is much later than in Young's day is probably not due to any permanent change in the seasons, but rather to the worst lands termed above "cold, wet, and backward," having been either underground drained, and thereby rendered drier and warmer, or having been sown down to permanent pasture. However, for all of a heavy nature still arable, it is a matter of the very utmost urgency that the wheat crop should be put in as early in October as possible, or at any rate in a season like the present when summer seems to return even in the last week, so that clays are found in their best condition unusually late), the work should be completed as early as possible in November. Very often a vast amount of rainfall comes after the middle of the latter month, when the surfaces of such soils as are being treated on become too soft to bear the tramp of horses, and tillage has to be abandoned.

If an autumn like the present had been experienced in the early part of last century—and, indeed, up to a late part in the third quarter of it—considerable breadths would have been dibbled. Some excellent papers on the advantages of dibbling were furnished even to the first Board of Agriculture. When wheat sold for six or seven shillings per bushel the saving in seed corn paid for the manual labour of planting, which was that of a man walking backwards striking holes on two furrows on which he walked, two women or lads following him to drop corns into the holes. Even when the soil was too dry for any other system of seeding the tramp of the operators gave such firmness thereto that the plant almost invariably became firm rooted and grew away strong. That this good system of seeding is gone out of fashion is due as much to the

scarcity and greater cost of labour as much as to the low value of wheat grain. Only small farmers with working families would find it economical now.

We seem to be experiencing a cycle of good wheat-cropping years. At least, we have had two successive ones that have stood at the top among the other crops as best yielding, and this admirable seed season will be likely to be one of the preliminary conditions which, it is to be hoped, will lead to another successful year. A favourable seeding, such as we are at present experiencing, usually produces a full strong plant to stand the winter. No doubt the character of the summer determines realisation more than anything else, yet without a good plant the most favourable kerning and ripening might possibly only yield half-average quantities of grain.

Railway Companies' "Owners' Risk" Rates and Conditions.

A conference with reference to this subject convened by the Mansion House Association on Railway and Canal Traffic took place on 23rd inst., at the Westminster Palace Hotel, Sir W. E. M. Tomlinson, Bart. (the president of that Association), in the chair. There was a very large attendance, among those present being Mr. William Field, M.P., Mr. Ernest Gardner, M.P., Mr. Arthur G. Hooper, M.P., Colonel Chas. W. Long, M.P., Mr. H. G. Montgomery, M.P., Mr. E. Parkes, M.P., Mr. Oswald Partington, M.P., Sir Alfred Arnold, Sir H. Gilzean-Reid, and delegates from some eighty Chambers of Commerce and Agriculture and kindred societies.

The provisions of the Railways (Contracts) Bill introduced in the House of Commons by Mr. Arthur G. Hooper, M.P., were discussed and approved, and it was unanimously resolved to send all possible support to that measure. Resolutions were also unanimously adopted respecting the course of action proposed to be taken only the object of giving effect to that resolution.

On Thursday next a number of pure bred Berkshire pigs belonging to Mr. J. H. T. Burton, Mere, Wilts., will be sold at auction by Burton, Messrs. J. Thornton and Sons. The herd is one of the oldest in the country and has supplied many herds with excellent sows. A sow from the herd has won numerous prizes and will be offered on Thursday at the same old price of the breed, with symmetry, quality, and constitution. The sale will commence after a twelve o'clock luncheon.

Notes of the Week.

There is much talk about "trusts"—"soap trusts," "bark trusts," "meat trusts," &c.

When all the necessities of life are sold by "trusts," more people than ever will have to live "on trust."

"Trust slayeth many a man," the wise man saith.

A little more mutual trust or combination among farmers would sometimes bear good fruit.

For instance, if there had been a Union among milk producers during the recent drought, they would have been able to protect their interests against the wholesale buyers.

But what we do not want is a union of butter with fat, or milk with borax or water.

A milkman was fined last week £100 for selling machine-skimmed milk containing excessive quantities of boracic acid.

If he goes on like that, he will be brought to living in another kind of "Union."

This country is threatened with the visit of another undesirable alien—the "American gooseberry mildew."

If it once gets a footing here, it will be harder to deal with than the German gipsies.

The Board of Agriculture should take steps to prevent its introduction, otherwise it will play "old gooseberry" with the gooseberry trees.

"Good meadows are the foundation of stock-breeding, the staff of agriculture, the riches of the farmer, the jewel of a prosperous country life."

"Poor meadows are a standing rebuke, a hardship to stock, and a source of poverty."

In America there are 400 fertiliser factories, with an aggregate capital of nearly fourteen million pounds.

The value of the raw fertilising material employed by them for their manufactures is about eight million pounds annually.

The first complete fertiliser factory in America was built in 1866.

Some cases of frozen tripe in a decomposed condition were recently condemned at Birmingham.

They formed part of a consignment of 1,000 cases.

It was stated that decomposition must have set in before the tripe was frozen.

No wonder people suffer from obscure diseases when they swallow alien germs of a poisonous character.

To most Englishmen the simple words barley and hops raise in the imagination a delicate aroma and pleasant associations.

It is, therefore, natural that the Brewers' Exhibition should be visited by large numbers of people; indeed, it grows in popularity every year.

The only reflection that damps the pleasure of many visitors is that the growers of the grain and the hops do not get more profit from their labours.

The side-shows of the exhibition excited a good deal of interest; one firm exhibit "British" cigars with the peculiarly British names of Propaganda, Flor de Vazex, &c.

SHOW GOSSIP.

We would draw attention to the fact that the Smithfield Club entries of stock and table poultry close on Thursday, November 1 next, at ordinary fees, and on November 5 at post entry rates. Entry forms, &c., can be had of the secretary, Mr. E. J. Powell, 12, Hanover Square, London, W.

We would remind intending exhibitors at the Birmingham Cattle and Poultry Show that the entries of cattle, sheep, pigs, corn, roots, potatoes, poultry, and pigeons close on Thursday next, November 1. The date of application for space for the exhibition of implements, &c., is already passed. The usual liberal prizes are again offered in all sections, including the three 100 guinea challenge cups, the total amount of prizes offered being nearly £3,500. Schedules and entry forms may be obtained from the secretary, Mr. W. H. Lythall, Bingley Hall, Birmingham.

The International Show at The Hague has now been fixed to take place the week after the Royal Show at Lincoln, and will last seven days, commencing on the afternoon of Tuesday, July 2, and ending on Monday, July 8. This will meet the convenience of breeders of horses who will be exhibiting at the International and Royal Shows.

At a recent meeting of the directors of the International Horse Show at Olympia, held under the presidency of Sir Gilbert Greenall, the prize schedule was arranged provisionally, but it will not be issued until the return of the English directors and Mr. Frank Euren from America, at they are going to the New York show to consult with prominent American exhibitors. The provisional classification is—Hunters and saddle horses, ponies under saddle, Polo ponies (to be ridden), Hackneys in hand, ponies in hand, Shetland ponies, dealers' classes, Roadsters, children's turnouts and classes for boy and girl riders, single Harness horses, appointment classes, novice Harness classes, ponies in harness, Carriage horses, pairs, tandems, four-in-hands, jumping (steeplechase, high, and wide), lending and polo ball competitions, tradesmen's horses, and foreign horses.

Sheriff Lee on Wednesday gave his decision in regard to the action brought by George Blair, farmer, West Balloch, by Montrose, against the president, Standing Committee, and secretary of the Angus Agricultural Association, as representing that association. The case was referred to by us last week, and it will be remembered that the plaintiff sued for damages and loss incurred in consequence of the defendants having illegally and unwarrantably refused to allow him to enter his mare Queen Marcella under the three-year-old filly class, and thereby deprived him of any chance

of winning a prize in that particular class. The defence was that the animal, having had a foal, was no longer entitled to be classed as a filly, but was a brood mare, and accordingly fell to be entered under the brood mare section.

The Sheriff thinks there is a necessity for some definite rule to guide and bind exhibitors in future. "For this reason," he says, "I think it not unreasonable that the defenders should bear some part of the expenses, which have necessarily been heavy for a small debt case, and according in finding the plaintiff liable in expenses I propose to modify them, and allow the defenders five guineas only."

A meeting was held at Retford on Saturday in connection with the decision of the Notts Agricultural Society to hold their next year's show at Retford. The local secretary (Mr. R. H. Stockdale) explained that it was proposed to raise a local fund of £400, and of this sum £60 to £65 would be devoted to the local horse classes of the Basetlaw Farming Society, which had decided to suspend its annual show for 1907 in order to support and make successful the visit of the county society. The first step to be taken was to secure a suitable site; and it had been suggested that the West Retford ground, which was lent by Major Milner for the last show of the Basetlaw Society, would be well adapted for the purposes, and there was reason to believe it could be obtained. A committee was appointed to view the proposed site and report.

It was decided at the same meeting that a recommendation be made to the county society that the prizes for Basetlaw should only be open to those residing and farming in the division, and it was pointed out that it would be desirable to have the Basetlaw classes judged on the second day. It was reported that the local guarantee fund had already received very liberal support, and no difficulty was anticipated in raising the required sum of £400.

South-Eastern Agricultural College.

The annual meeting of the governors of the college was held last week, Lord Ashcombe presiding. The Principal (Mr. M. J. R. Dunstan) reported that the autumn term commenced on October 1 with 113 students (the largest number yet recorded) in residence.

Milkman Fined £100.—At Spelthorne Petty Sessions, Surrey, on Monday, Joseph Winchester, milkman, of Twickenham, was fined £100 for selling machine-skimmed milk containing boracic acid equal to 684 grains of borax per gallon. It was stated that defendant's customers were absolutely of the poorest class of people. There were several previous convictions against him, and time for payment being refused he was removed in custody.

THE FARMERS' DIARY.

TUESDAY, OCTOBER 30.—Horncastle Fair, second day—Ashford Cattle and Sheep Fair—Preston Cheese Fair—Collingham Farmers' Club Show—Agricultural Fairs at Brampton, Newtown, Lettice, and East Harling.

WEDNESDAY, OCTOBER 31.—Saintfield Horse and Cattle Fair—Nuneaton Agricultural Fair—Tadcaster Cattle and Sheep Fair—Southern Farm Sale, Norfolk—Mottram and Colne Cattle and Pig Fairs—Tarrant Ransom Farm Sale, Dorset—Hawes and Shrewsbury Cattle Fair—Entry class for Lord Tredegar's Show.

THURSDAY, NOVEMBER 1.—Agricultural Fairs at Earith, Doncaster, Alston, and Northampton—Ripon Cattle Fair—Devizes Cattle Fair—Newark Cattle Fair—Special Sale of Berkshire Pigs at Mere, Wiltshire—Dorington Special Cattle Market—Last day for Entries Smithfield Cattle Show—Last day for Entries Birmingham Fat Stock Show, and Tonbridge Fat Stock Show.

FRIDAY, NOVEMBER 2.—Teddington (Beds.) Cattle Fair—Oakham Agricultural Fair—Mansfield Sheep Fair—North Shields Horse and Cattle Fairs—Lichfield Horse Sale—Yeovil Horse Sale.

SATURDAY, NOVEMBER 3.—Hallfax and Saffron Walden Horse and Cattle Fairs—Buckingham Cattle and Sheep Fair—Last day for Entries for Scottish National Fat Stock Show at Edinburgh.

MONDAY, NOVEMBER 5.—Farmers Club 4 p.m. Address by Mr. John MacLaren on Farm Implements—Agricultural Fairs at Longridge, Alston, Helmsley, Ferryley, and Welshpool—Horse and Cattle Fairs at Grewe and Aberystwyth—Sheep Fairs at Blandford and Keswick—Weyhill Fair.

TUESDAY, NOVEMBER 6.—Agricultural Fairs at Tregony, Preston, Thurles, and Kingston—Preston Great Horse Sale—Meeting of the Central Chamber of Agriculture, Adelphi, 11 a.m.

VETERINARY.

Advice of a Veterinary character, by an M.R.C.V.S., is offered to Readers entirely free of charge. Particulars of cases should be addressed to the Editor, "MARK LANE EXPRESS," 3, Wellington Street, Strand, London, W.C.

A Ruptured Colt.

SIR,—I wish to ask the advice of your veterinary, through the medium of your paper, respecting a ruptured colt. The said colt, which is a Shire, has been so from his birth, and is in all other respects as nice a colt as could wish for. I was told when he was foaled that this would probably right itself, but there is as yet no signs of its doing so. Can this be put back successfully when castrated, to remain, so as to make a sound horse? I have myself had no experience in this, never having seen one before like it, but am told there are several in our district this season the same. There was no strain at the time of birth other than natural, as the mare foaled by herself, and I am at a loss to account for it any more than as a freak of nature.

A CONSTANT READER.
* * * The key to the situation is to be found in the postscript to your letter. Age of colt four months." The case is clearly one of congenital serotal hernia—the most frequent, but the least dangerous species of hernia. You say:—"I was told when he was foaled that this would probably right itself." You were correctly informed, but as to there yet being no signs of its doing so, you have not allowed sufficient time to elapse. Probably your colt, as well as those of your neighbours who have also had foals produced this season showing congenital serotal hernia, will come all right in due course, and you should wait on time and Nature.

Professor Williams in his "Principles and Practice of Veterinary Surgery," describes congenital serotal hernia as "a frequent attendant on birth, augmenting up to the third or sixth month, after that diminishing, and ultimately disappearing. Should it continue with lessening in volume for a year or eighteen months, it may be considered as, and is in fact become, a chronic or permanent serotal hernia."

In case the swelling, however, instead of being always the same, at intervals diminishes, and continues so to do more sensibly as time advances, it will in the end recede altogether, and though it returns again at times, still, the relapses growing less marked or frequent, at last the gut will enter the ring no more." Your animal is only four months old—a very late foal—and there is yet plenty of time for the hernia to be spontaneously reduced, and, therefore, plenty of time to consider the method of operation for hernia in stallions and castration by what is known as the covered operation. There need be nothing abnormal in putting to account a congenital serotal hernia—it can be accounted for by the condition of the parts involved in the fetus in utero, as we are prepared to explain, if you wish.

M.R.C.V.S.

Notes and Jottings.

"He doth nothing but talk of his horse."
"Merchant of Venice."

THERE are some people who are never tired of telling us that, as a horse-breeding nation, we are getting behind the times; that we are not up to our Continental and American rivals; that we have lost our prestige as a horse-breeding nation. Some months ago it was asked in a popular magazine, Are we a nation of horsemen? and the question was answered in a melancholy negative. Commenting upon that article, I was bound to admit that we are not a nation of horsemen in the same sense that we were forty or fifty years ago. Time was when everyone rode, simply because they were obliged to. That time went by, and country people all rode, partly because they liked it, partly perhaps on account of the

I know many dealers in northern counties who supplement the home-grown product with importations from Germany and Belgium, and I have even heard it whispered that German and Belgian horses have travelled *and* some Yorkshire establishments to London, where they have posed as Yorkshire horses.

NOW I am quite with those gentlemen who say that we should be able to produce the harness horses we require, or most of them, though perhaps I may not agree with all their theories as to how we ought to proceed to breed them. And even yet the breeding of harness horses is a profitable branch of farming, as some of my Yorkshire friends do not need telling. But I cannot agree that the Germans and Belgians are beating us at breeding harness horses, as I have occasionally been told by those of my friends who are of a pessimist's turn of mind. And I do not think we are likely to be beaten by them either. A London dealer said to me only the other day that if a man wanted harness horses his choice lay between a Yorkshire horse and a German dute—a sufficiently expressive, if not elegant, remark. I would be understood in this respect. I have seen some very good German match pairs—very good indeed—though I do not think the best of them were "in it" with Yorkshire coach horses.

AND what are those German harness horses? The best of them are known as the Trakehner breed. Now what is the Trakehner horse? Sir Alfred Pease, some sixteen years ago, went to Berlin to the great German Horse Show, and took great pains to trace the German Karrossier or

on their studs. Here is something for those who are constantly urging the desirability of Government studs here to reflect upon. It is a common thing to hear people say—"See what they do for horse-breeding in other countries." Well, Sir Alfred Pease did see for himself, and was not much impressed. And I would ask, is there any reason to think that in England there would be more result than in Germany? We have been pretty well used to a prodigious amount of suck to put a halfpenny worth of bread in most of our public accounts since the times of Falstaff.

BUT the most important lesson which Sir Alfred Pease would impress upon us is the danger of indiscriminate cross-breeding. This seems certainly to have prevailed in Germany at one time, and the results were plainly to be seen. Sir Alfred emphasises the fact that "unless certain types and distinct breeds are carefully maintained and an ideal type kept in the eye, in attempting to breed one particular class our native breeds may degenerate into herds of mongrels and non-descripts."

PERHAPS these words of warning were never more applicable than in the present day, and perhaps there is no horse breeding that they are so applicable to as the breeding of Harness horses. For the fashionable Harness horse is sometimes one kind of horse and sometimes another. He must be showy; he must have showy action; he must be a good colour; he must be lengthy and well proportioned; there must be nothing approaching shortness of quarter; he must look well in his leather as he stands still; he must knock his carb chain with his knees when he moves, when the craze is for high action. Now there is no single breed of horses in the world that has all these properties, and the temptation to cross in all directions to get them in one animal is very great. Now a very prevalent cross has been to mate a Hackney stallion of good colour with a lengthy, stylish Coaching mare of good quality. I have seen a great many geldings bred in this way, and very good horses most of them were and very easy to sell at highly remunerative prices.

BUT what has always puzzled me when I have seen these good looking geldings is what becomes of the fillies. "I breed geldings," says one breeder on being remonstrated with for his persistent use of Hackney sires with good Yorkshire Coaching mares. "I have no fancies," says No. 2, "I breed what I can sell." Just so; but I ask again, what becomes of the fillies? No man can ensure breeding colts that will make good geldings. Now if fillies are bred, sooner or later they will be bred from. I need not point out that it is likely to be sooner rather than later, for people do not care as a rule to drive mares—at any rate, they are not valuable as geldings. Nor do I doubt at all that I shall be told that so long as the mares are not registered in any Stud Book it does not matter if they are bred from. I shall also be told—indeed I have been told—that a cross-bred mare has bred a good horse. That is possible; but I have yet to learn that these cross-bred mares breed one good foal after another as a rule; again, how will the third and fourth generations breed? There seems a great risk of degeneration into "herds of mongrels and non-descripts," for one thing is certain, if crossing is to be successful both breeds that are used in the crossing should be kept as pure as possible, and it is one of the canons of cross-breeding that the first cross is the best.

THE LOOKER-ON.

Sale of Hunters.

Some good prices for Hunters were obtained at Messrs. Warner, Sheppard, and Wade's sale at Leicester on the 20th inst. The best lots were those sent from Burton Agnes, Yorkshire, by the well-known breeder, Mr. T. Wickham-Boynton. Peppermint, a lady's hunter up to 13st. 7lb., realised the top price, 260 guineas, and Rainbow, a brown gelding by Hindley, changed hands at 250 guineas, while there was a bid of 200 guineas for Secretary, a six-year-old by Irish Secretary. Farrier, from the same draft, realised 185 guineas. Among the early lots were Gilroy and Nelson, sent up by Miss Ratcliffe, and they were sold at 35 guineas and 45 guineas respectively, while Colonel J. W. Chaplin accepted 50 guineas for Fred Fraser and 45 guineas for Mystic. Another good draft were the Hunters of Captain W. S. Power, D.S.O. Rapier being sold for 65 guineas and Rifleman for 51 guineas, while Sir Hill Chubb sold the whole of his Hunters for 359 guineas. The Mormon realising 120 guineas and Kilkee 85 guineas. O'Neil, the winner of the regimental steeplechase at Hawthorn Hill in 1904 and 1905, being the bargain of the lot at 31 guineas. Colonel C. J. Long sold The Dane for 43 guineas, and Mrs. Critchley Martin accepted offers of 90 guineas for Duchess and 61 guineas for Juno.

Suffolk Horses at the Royal Show.

At the last meeting of the council of the Suffolk Horse Society, held at Ipswich, a letter was read from Sir Gilbert Greenall re Suffolk horses

HACKNEY STALLION. COPMANTHORPE PERFORMER.

Exhibited at the Royal Show at Derby, and also the Hackney Horse Show of this year, where it won a First Prize, by Mr. A. Hall, Copmanthorpe Grange, York. It was foaled in 1904, sire Garton Duke of Connaught, dam Copmanthorpe Lily, and was bred by Mr. G. Hall, Bishop Wilton, Wilberfoss, York.

old tradition. I can remember the time well when very few farmers drove to market unless they had some produce to take, or were driving their wives or daughters to do some shopping. If a man had anywhere to go it was the natural thing for him to ride. This has long been changed. The bicycle had something to do with the change, and in the modern craze for being in a bad hurry the motor car gets the rich country gentleman instead of the galloping hack. I can remember when men, young or old, thought nothing of covering seventy miles or more in a day on horseback. I have done it many times myself, and taken it all in the day's work—very likely had a ride on another horse when I got to my journey's end.

BUT how many people do it now? One may safely say that they are getting fewer every year; and so in the sense of the world in which it is used in the article. I have mentioned that we are no longer a nation of horsemen. But all other nations are in just the same position in this respect that we are, and *pace* our critics we are still the stud farm of the world; and we are likely to remain so, though we shall be none the worse for being sharpened up a bit at times.

FOR the last twenty years, or perhaps not quite so many, it has been a well-established fact that a very large number of the carriage horses in the hands of the London dealers were foreigners. Nor was this the case only with London dealers.

Harness breeds to their source. Now Sir Alfred Pease was no mere theorist. He was a practical breeder with no small experience in the breeding of the Harness breeds of his native country, and anything he had to say on the subject was worth regarding. His opinion was that the Trakehner breed was by far the best of all the German Harness breeds, and he found that he was a cross-bred horse—one-fourth native, one-fourth of Eastern blood, and half of English blood, of which a considerable proportion, at any rate, was Cleveland Bay. So that English blood preponderates in the best German harness horses, and at the best they are a cross breed which has to depend on constant importations of foreign blood. So it does not seem as if we had a great deal to fear from them; for we still have a sound foundation at home in the Cleveland Bay and his near relative, the Yorkshire Coach horse.

THE bulk of the horses Sir Alfred Pease saw in Germany, and mind he saw the best of them at what was the National Horse Show of the country, were a somewhat cross-bred, mongrel lot, such as did not appeal to him at all. Undersized many of them were and of all colours. But to the practical eyes of the experienced English breeder there was a lesson to be learnt from German horse-breeding, or perhaps two lessons. The first thing which seemed to impress Sir Alfred was the poorness of the result in proportion to the great amount of money spent by the Government

at the Royal Show, which caused a lengthy discussion. Sir Gilbert's letter was as follows:—

"A sub-committee, of which I am chairman, has been appointed by the council of the Royal to consider the schedule for next year's show. We hope to increase the prizes throughout the horse sections to £15, £10, £5, but this cannot be done without the assistance of the breed societies, where the entries are small. The Suffolk entries at Derby hardly justify the Stock Prizes Committee in continuing the same classification, unless they have substantial help from your society. If your society could see its way to giving £50 towards the prizes, we could give the same number of classes as last year, with increased prize money, which would, I feel sure, ensure a really representative exhibition of the breed. We are most anxious to maintain a full classification for all our most important breeds, and should not like any classes to be withdrawn without the matter being brought before the different breed societies. I will send you a subscription of £5 if the test can be obtained."

The president of the Suffolk Horse Society (Sir Cuthbert Quilter) remarked that he thought the Royal acted unwisely in reducing the prize money. Considering that the next show was supposed to be an Eastern Counties Show, the Royal ought to give adequate prizes for a breed that was sure to be well represented. It was a great expense sending the exhibits, and a £10 first was not sufficient.

Mr. A. J. Smith thought the Royal had treated the people of Ipswich and neighbourhood very badly by throwing them overboard after having pressed them to invite the show to the place.

The president and other gentlemen spoke in no complimentary terms regarding the way Suffolk had been treated, but the president pointed out that they were to transact business there to the advantage of the breed they represented.

After several suggestions a motion, proposed by Mr. Preston, seconded by Mr. Marriner, was carried to the effect that a £50 challenge cup be given, as last year, with the addition of £25, to form a new class for aged stallions, on the condition that the prize money was increased as suggested.

NOTES AND NEWS OF AGRICULTURAL SOCIETIES.

Cleveland Chamber.

The report presented at the 26th annual meeting of the Cleveland Chamber of Agriculture, held on Tuesday, stated that the number of members on the books was one less than last year—viz., 171. After referring to the two useful measures passed this session, the Dogs Bill and the Fertilisers and Feeding-stuffs Act, the report stated that if the recommendations of the Select Committee appointed to inquire into the whole question of butter and butter substitutes were given effect to by Parliament, as promised, next year, they would do much to put a stop to the fraudulent practices which have been tending to destroy the butter industry in this country. As to the importation of Canadian cattle into this country, the report said the question was one which needed the increasing vigilance of all concerned in the prosperity of British agriculture. The Marquis of Zetland was unanimously chosen as president for the ensuing year, whilst it was decided to petition the N.E.R. Co. and the Great Northern Railway Co. with a view to their granting reduced fares to representatives from the provinces to the meetings of the Central Chamber in London.

Gloucestershire Chamber.

The chief subject discussed at the last meeting of the Gloucestershire Chamber of Agriculture was local taxation. Mr. William Friday, who introduced the subject, said the rise in the rates had practically wiped out the advantages derived under the Agricultural Rates Act, and for the increase he held the county council mainly responsible. He moved the following resolution:—"That this chamber observes with regret the apathy which appears to prevail amongst ratepayers generally with regard to the great increase in local rates. The establishment of county councils, the multitudinous duties imposed upon them, coupled with their own extravagance, renders it more than ever necessary that the whole question of local taxation should be entirely revised. This chamber would, therefore, urge upon the Government the necessity of including personal property assessable to so-called local rates, and thus deal with the matter in a comprehensive manner." Several members spoke in favour of the resolution, and it was carried unanimously.

Midland Farmers Co-operative.

At a meeting held in Nottingham on the 20th inst., it was decided to start a farmers' co-operative association under the title of the Midland Farmers' Co-operative Association, and the outlook possesses a large and successful association.

NOVA SCOTIA

Offers advantages to British Agriculturists with moderate capital. Improved Farms at Low Rates. Fertile Lands. Famous Fruits. Enormous mineral deposits of Coal, Gold, Silver, Iron, Copper, Lead and Tin. Climate temperate and healthy. Easily accessible to all the principal markets.—Full information supplied by the Agent-General for Nova Scotia, Mr. JOHN HOWARD, 57A, Pall Mall, London, S.W.

Among the speakers was professor J. F. Blackshaw, of the Midland Agricultural and Dairy Institute, who said that the society should be established in the first place for the purchase of farmers' requirements—feeding stuffs, manures, and implements. It was not advisable to try to control the price of milk until they had sufficient funds. Members of the society must be occupiers of land, and shares would be proportionate to the occupation—at the rate of 6d. per £1 rental; but it was not thought that it would be necessary to call up more than a quarter of that.

Wenlock Farmers.

"It is a proud boast that this the sixty-fifth anniversary of the Wenlock Farmers' Club; during that time there have been many other clubs and shows established—some have gone, others have again sprung up. All have been welcomed heartily; but clubs may come, and clubs may go—we go on for ever." This interesting statement was inserted in the annual report of the committee of the Wenlock Farmers' Club, which was presented to the members at the anniversary of the club. During that long period the promoters of the society have had such support from landlords, tenants, and the public generally that they have been able to persevere in their endeavours to benefit the agricultural interests of the district over which the club's area extends. When the club was started in 1842 the primary object was to have discussions on subjects of interest to those engaged in the agricultural industry, "political questions being rigidly excluded." At that period the members usually met together "when the moon was at the full," and there were some interesting discussions. Agriculturists, however, like people in other walks of life, have found it necessary to move with the times. The ploughing and hedging competitions have been abolished in the Wenlock district, the discussions are confined to the speeches at the annual meetings of the club, and the members have turned their attention to breeding Shire horses and Hunters. In this many of them have been most successful, and Hunters and Shires from the Corvedale district have in recent years realised for their owners good prices. That the Wenlock Farmers' Club may continue and prosper in its good work is the wish of all.

DAIRY.

Kilmarnock Dairy Show.

The fifty-second annual show of dairy and other farm produce under the auspices of the Ayrshire Agricultural Association attracted 1,320 entries, a slight increase over last year's aggregate, and also over that of the previous year's—the jubilee show record entry. Cheese formed the principal exhibit. The entries in this department were precisely the same numerically as at last year's exhibition, the total number being 688. The quality showed all round a decided improvement; indeed, one of the judges stated that the highly commended lot in his class was quite equal to the first prize exhibit in the ton competition last year.

Business in the cheese market was not particularly brisk, and but for the presence of some English buyers it might indeed have been described as rather dull. The ruling prices were: Dunlops, 65s. to 68s.; Cheddars, 67s. to 70s., with a shilling or two more for prize lots. The English buyers practically made the market in white Cheddars and fine Dunlops, and most of these went to Somersetshire, where, owing to the drought, there was a small back-end make, with a consequent shortage of supply.

The butter exhibits showed quite a marked improvement, and the section was, perhaps, the best seen in Kilmarnock. It was pleasing to note a higher standard of quality in the powdered and salted classes, but there is still room for improvement in the curing department.

Gainsborough Cheese Fair.

At Gainsborough Cheese Fair on Tuesday there was a good show, but the "pitches" were not so large as on previous occasions. Trade all round was fair. Quotations:—English Stiltons, 10d. per lb.; Cheddars, 6d. to 10d.; Cheshires, 7d. to 8d.; Gorgonzolas, 7d. to 8d.; Trentsides, 7d. to 8d.; good Derby shapes, 6d. to 8d.; and American States, 5d. to 7d.

CATTLE WASH.

Used regularly on the Herds of H.M. the King. CUTOXINE removes all Dirt. CUTOXINE prevents accumulation of Scurf. CUTOXINE improves the Coat. CUTOXINE promotes abundant growth of Hair. CUTOXINE is absolutely free from Poison. CUTOXINE destroys Lice and all Parasites. CUTOXINE immediately cures Ringworm. CUTOXINE prevents Skin Diseases.

WIND-GALL Write for Illustrated Booklet, T.

Notes and Jottings.

NOTWITHSTANDING the late time of year, the copious rains we continue to have are making a capital impression upon the pastures. The soil was warm, and the soaking rain has made the grass spring with magical haste. When marshrooms are abundant grass always grows, and this fungus has been very plentiful of late. The weather, however, as regards temperature, continues very much of the same character it has assumed throughout the year, extremely changeable one day, excessively close and warm the next, a nor-herly wind is blowing, and a frosty feeling chills the air. These sudden and extreme changes are very trying to animals of all kinds at any season, but probably more so as we approach winter. These changes give a reminder that fodder or warming food of some kind should not be forgotten.

SEVERAL very good averages of pedigree stock have been made recently. Prominently

at the retail price, and when adulterated it makes a very dear assistance to the daily bill of fare. The restrictions affecting the sale of poor milk are quite necessary.

THE quality of milk at such times as the present, when every means is being taken to increase the quantity, can be made to retain sufficiently good quality at a very moderate cost by adding to the daily food which makes up the bulk of their living, whatever it may be, a few pounds of cottonseed cake. This food is at a very reasonable price, and there is no more direct enricher of milk to be obtained. The small sum of about eighteen pence per cow per week would be sufficient to make all the difference between a blue looking poverty stricken quality of milk and a milk yielding a rich yellow cream that everyone so much prizes, and, besides this, the condition of the animals will be much improved.

A GOOD deal is said and written and many different systems are tried for the rearing of calves. First comes the question of whether they should be brought up upon the cow or whether they should be reared at the pail. Next comes the question should they be fed entirely upon milk whole or skimmed, or should they be brought up upon some one or other of the many calf foods that are so freely advertised and so much patronised, or, in a word, how should they be reared? Then there comes also another important question as to management. Should they be allowed free liberty—that is to be turned loose in the field or the fold yard, or should they be tied up or kept in separate loose boxes that could be knocked up at a small cost? There is a great deal to be considered in these many ways of dealing with the calf.

slight shrinkage is practically unavoidable, and it is during these days of shrinkage that the hand reared calf has the advantage, and very nearly, sometimes quite, catches up the more rapidly early grown youngster. In the case of calves to be brought up for dairy purposes there is no doubt as to the less forcing diet of skimmed milk and other aids that give lesser forcing, being absolutely necessary, and the after-feeding up to two years must not be too rich and fat-forming.

THEN comes in the further question of management during this time of rearing. A herd of anything from four to eight or ten calves all loose in a pen are quite a terror to the man or men who attempt to feed them from the pail, and not only is there perplexity for the men, but there are always a certain number of the calves that are underlings, and these get but a mighty small portion of the suckling doled out for the lot at so much quantity per head. The result is a very variable herd as regards size; uniformity is not by any means a strong point, and there is sometimes loss by one or two calves doing too well, and falling of red water or black leg, which somewhat resembles that plague in effect. A very excellent plan has been found by the writer and also many others to prevent these troubles—that is by tying up.

THE method adopted where tying up is decided upon is to make up a little stall (a miniature horse stall) with manger and rack for each calf. The partition must be high enough to prevent the calves reaching over, and there ought also to be a raised hoarded floor, or what may be called a false bottom to these stalls. This should be made of boards either perforated, or not closely jointed, so as to admit of the urine, and any other liquid that might be spilled, from keeping the bed damp. A damp bed, or indeed a damp house, is very bad for calves, and invariably brings about, or some other ailment that hinders progress and causes expense one way or other, as well as loss of growth. The floor (bottom-most) should be smooth brick with a good fall, so that all moisture can quickly escape.

CALVES brought up by hand need to be fed from the pail up to from twelve to fourteen weeks old, depending a little upon the food at hand to take them on to end the season of the year. If good feeding, either a few roots (calves cannot digest an unlimited ration of these) or grass are at hand to give them, then whichever is in season will be the first step towards substitution for the pail food, and when the calves have well taken to them and their stomachs have become able to assimilate this food a little linseed cake, or if on rich and succulent grass, a little deoctrinated cottonseed cake will be all that will be required for some time to cause rapid development and gain of weight. If in the yard or in winter season natural good, sound, sweet hay must take the place of the summer grass.

THE question of dealing with the calf at birth is one upon which many men have many minds. A large number of breeders, more especially those who are breeding dairy cattle, prefer to take the calf away from the dam immediately, not even allowing the mother to see it. There are points in favour of such a plan as well as against it. In favour of it is the fact that the calf usually takes to drinking from the pail much more readily while quite young, and the cow settles down to her milk yielding perhaps quite as quickly as she would if the calf were allowed to remain with her for some days. In favour of allowing the calf to remain, however, evidence is very strong. There is a medicinal, so to speak, health giving tendency to both cow and offspring in the licking of the calf with the rough, rasping tongue of the dam, and the latter certainly obtains a little or perhaps a good deal of satisfaction from the affection so engendered.

THE allowing the cow to have the companionship of her offspring, too, for a time certainly has the effect of giving her the experience of maternal duties and stimulates her affection, often to the benefit of the owner, very much as in the case of a cow calving out in the field or in the box unexpectedly at any time; she will know, as a herdsmen said the other day, exactly how to go on with the baby whether I am there or not. The consequence is a hearty, strong calf in two or three hours. A great contrast is here presented when compared with the mother that has never been allowed to nurse her calf for a time; she calves in the open field and may be even vicious with the little animal, or otherwise leave it religiously alone; result, a good calf is so starved as to be past recovery, and so is lost entirely.

Sir R. W. B. Jardine's Galloways.

On Tuesday Messrs. Harrison brought under the hammer at their Lockerbie Auction Mart, a splendid draft of pedigree Galloway cattle, the property of Sir R. W. Buchanan Jardine, Bart., of Castlemilk, the sale being occasioned by one of

JERSEY COW, UNAWARE.

Winner of First Prize in the Class for Jersey Cows, entered in or eligible for the Herd Book, at the recent Lough Dairy Show. Shown by Capt. L. G. Gisborne, Home Farm, Allestree, Derby; bred by Mr. W. Alexander. Her sire was Silver King, and her dam Homefield.

in these was that of the Tring Park Jersey sale, where something over forty head reached the respectable average of £31 8s. 4d. It is a long time since we have had the pleasure of recording so high an average for so large a number of animals of this breed. Of course the herd has a great reputation, and an enviable reputation, inasmuch as it has a great record of prize winning by inspection, and also has a very prolific and profitable record in the way of milk and butter. The Lincoln Red Shorthorns, also, at Kedlington Grange, with an average of £40 per head for a large number, is very satisfactory. This breed is an excellent dual-purpose one when properly cared for and the breeding attended to—that is mating milk with beef.

WHETHER the unseasonable supply of succulent grass or the large amount of other green food that is given to the cattle, such as mangrel tops, common turnips, kale, maize, &c., has the effect of causing cows to yield a poorer quality of milk, or whether the scarceness of milk has caused many milk sellers to adulterate their milk by the addition of water is hard to say, but we have not for a long time past seen so many accounts of lines being inflicted as can be found now in most of our daily papers. Rarely a day passes without seeing one or more cases. This is not as it should be. Milk is not by any means a cheap article of food to those who have to buy it

ONE point that will help greatly in arriving at a conclusion as to the means to be adopted is to arrive at the purpose for which the calf is to be reared. If early maturity for the butcher is the main point, then nothing can beat the cow. But here comes in a third question—Will it pay? The answer at present prices of beef must undoubtedly be written in the negative. Beef at 6d. to 6½d. per lb. will not pay for a new milk diet from birth, and the whole produce of the cow for practically a year. This milk, even in the beef breeds, would be worth from £10 to £12 for the full period of lactation, and when to this amount comes to be added the wear and tear of the cow, the artificial food required for the calf up to its time of being sold, and also the bulky food it would consume, there cannot by any means be other than a great loss incurred.

THEN on the side of skimmed milk and manufactured calf foods there is a certain amount of greater expense in labour and cost of food that helps up considerably to the total bill, but even when every item of these smaller costs is considered the whole does not nearly approach the cost of new milk from the cow. Then as regards development. The calf, we know, grows very rapidly when either comfortably housed or lying in a rich pasture of grass at its dam's side, but there comes a day sooner or later when dam and offspring have to be separated, and at this time a

AUCTION SALES.

Auctioneers will favour us by sending in their advertisements as early in the week as possible.

By JOHN THORNTON & CO.

BURTON, MERE, WILTS.

IMPORTANT SALE OF PURE-BRED
BERKSHIRE PIGS.

JOHN THORNTON & CO. will SELL by AUCTION, on THURSDAY next, NOV. 1 (1.30 o'clock), at Burton, Mere, four miles from Gillingham Station, L. and S.W. Railway, Mr. J. A. Fricker's celebrated herd of pure-bred BERKSHIRE PIGS. The herd has produced many noted prize-winning sires, and the winners of the champion prize, and the Duke of York's £50 Silver Cup at the Smithfield Show, 1898, were bred at Burton.

The herd is to be sold in consequence of the farm being given up.

Catalogues may be had of JOHN THORNTON & CO., 7, Princes Street, Hanover Square, London, W.

By PROTHEROE & MORRIS.

W. HORNE & SONS

to hold a GREAT SALE OF FRUIT TREES and
POTATOES on the Premises,

PERRY HILL, CLIFFE, NEAR ROCHESTER, KENT
adjoining Cliffe Station, South Eastern Ry., on
WEDNESDAY, NOV. 14th, 1906.

150,000
FRUIT TREES
AND BUSHES

of all kinds, including several
thousand

STANDARD APPLES, PEARS, AND PLUMS.

Also a very fine lot of Pyramid Apples, 1, 2, and 3-year on English Paradise. About 50,000 Half-Standard Apples on Crab Stock; also Pears and Plums. About 30,000 Black Currants, 40,000 Gooseberries (including 5,000 May Duke), 15,000 Red and White Currants, 50,000 Raspberries, 20,000 Asparagus Plants, and several thousand Strawberry Plants, several tons Scotch Potato seed, about 1,000 Loganberry Plants.

Free Lunches at 11 a.m. Sale at 11.30 a.m.
NOTICE.—The Auctioneers desire to call the attention of Fruit Growers, Market Gardeners, and intending Planters to this important Sale. It is seldom such an opportunity offers itself for securing new and rare kinds of Fruit Trees, &c., in such large quantities. All are well grown and healthy; they are without doubt the finest lot of Fruit Trees ever yet offered at Cliffe.

Fourteen days will be allowed to clear and settle all Accounts. Messrs. Horne and Sons will lift and cart all lots and put them on rail after the Sale free of charge.

Catalogues free of Messrs. HORNE & SONS, Cliffe, near Rochester, and of the AUCTIONEERS, 67 and 68, Chancery Lane, E.C.

the farms on the Castlemilk estate, where Galloways were bred, having been let. The herd was built up by the late Sir Robert Jardine, Bart., by the use of the two best bulls of the day, and the character of the herd brought together a large number of breeders representative of all parts of the kingdom. In addition to the stock from the farm already mentioned, a few from the main herd were also offered. Most of the cattle were highly bred, and were shown in nice bloom.

For the best of the animals there was a fairly good demand at prices on the whole satisfactory, while for those of ordinary stamp competition was limited. Some of the cows were of good age, and under these circumstances sold well. The top price was 40 guineas for Natalie of Castlemilk, calving January 2, 1902, and she fell to Mr. Cunningham, Tarbroch. Mr. Caldwell, Belfast, gave 28 guineas for Lady of Castlemilk, calving March 11, 1901, and also 28 guineas for Lady Vaudeville 5th of Castlemilk, calving in March, 1903; whilst Mr. Fox-Brockbank gave 32 guineas for Lady Primrose of Castlemilk, born March 24, 1900. Other cows sold at from 12½ guineas to 25 guineas. The best of the two-year-old heifers went at 27 guineas and 26 guineas, one year-old heifer made 30 guineas (Lady Primrose 3rd, bought by the Countess of Carlisle), but the best price for the others was only 14 guineas. Heifer calves realised from 7½ guineas to 14½ guineas, and bull calves from 6 guineas to 8½ guineas.

when writing to our Advertisers.

Devon Cattle Breeders' Sale.

The biennial sale of pedigree Devon cattle, held under the auspices of the Devon Cattle Breeders' Society, took place at Exeter on Wednesday, Messrs. John Risdon and Son, of Wiveliscombe, as usual, being the auctioneers. The entries were not quite so numerous as usual—about 50—but the attendance of breeders and dealers was very fair, the principal counties being represented. For the highest-class bulls the competition was keen, but medium-class animals were not so much sought after. The sale, however, was, on the whole, satisfactory. The range for the choicest animals was from 24 guineas to 34 guineas, and others from 15 guineas to 23 guineas.

Sale of Lincolnshire Red Shorthorns at Louth.

A show and sale of Lincolnshire Red Shorthorns was held at Louth by Messrs. Dickenson, Riggall, and Davy on Wednesday, where the entry was not a large one owing to the numerous sales which have of late taken place on the premises of some prominent breeders. The first prize animal in the class for cows in calf, not exceeding three years old, was owned by Mr. L. W. Stephenson, of South Thoresby, and his exhibit was afterwards sold in the sale ring to Mr. Shaw, of Marsh Chapel, for 27 guineas. In the class for females between nine months and two years old, Mr. J. Marriott, of West Lea, Cropwell Butler, was first, Mr. Hey-

wood subsequently becoming the owner of the exhibit for 12½ guineas. Mr. H. Whitworth, of Oxcombe, won both prizes in the class for heifer calves, and Mr. J. T. Marshall, of Withern, won first prize in the class for bull calves not exceeding 15 months old with an exceedingly fine animal, which went to Mr. B. G. Stone, of Elkington, for 30 guineas. The averages were as follows:—Eleven cows with service, £18 13s. 3d.; ten heifers with service, £15 10s. 4½d.; seven young heifers, £8 15s. 6d.; ten bulls under fifteen months, £14 7s. 2d.; four bulls exceeding fifteen months, average £20 16s.

Shrewsbury Store Stock Sale.

Messrs. Alfred Mansell and Co. held their second autumn sale of store stock in the Shrewsbury Smithfield on the 19th inst., when one of the finest lots of cattle that have been seen in the Midlands for some time past was offered. The various breeds included grand Hereford bullocks, which made up to £18 15s. each; Shorthorn heifers, which reached £16 10s.; Shorthorn bullocks, £16 5s.; polled Angus, £15 10s.; cross-breeds, £15 5s.; Welsh, £13. The sale was largely attended, and prices for the best cattle were good, but cattle in poor condition did not meet with such a ready demand.

Sale of Mr. Speakman's Herefords.

To the best herds of Hereford cattle dispersed this year has now been added that of Mr. P. E. Speakman, of Birley Court, near Leominster (who is relinquishing farming), it being brought under the hammer by Messrs. A. and D. Edwards on Tuesday last. Mr. Speakman commenced his herd with cows and heifers from The Leen and Court House herds, and there were a number of The Leen cows in the catalogue, chiefly by Pagan by Major Grove; there was also one by Clarence, an in-couple by Commander-in-Chief, a bull used by Mr. A. P. Turner, and coming from the Duxmoor herd. It was noticeable that these were among the top prices, the highest figures being obtained for a Newton Moore cow and her half calf. There were three representatives of the Court House blood in Sophy by Boniface, Berinda by Advantage, and Birley Sophia by Newton Hope. Mr. John Tudge's Duxmoor Herd supplied two grand heifers, one, Sapphire, being out of the champion Shotover's dam. The herds of the late Mr. John Pitt and Mr. George Bray and the late Mr. J. P. Apperley were also represented. The sire stock include Parton and Bardolph, bred by Mr. A. E. Hughes, and the Whithorn bull Major Domo, to whom nearly all the cows and heifers were in calf.

There was a good attendance at the sale, and though prices were not out of the ordinary, they came up to those of recent sales. Top figure was 45 guineas, given for Berinda by Mr. John Morris; whilst for her bull calf Mr. R. Jones, Perthwin, Cawers, Montgomery, gave 23 guineas; Butterfly 2nd went to Mr. Langford, Chirbury at 32 guineas; and Mr. D. A. Thomas, M.P., got Vanity for 30 guineas. Other prices for cows ranged up to 26 guineas; three-year-old heifers made up to 30 guineas; two-year-old heifers, to 29 guineas; and yearlings up to 25 guineas; whilst the bulls sold as follows:—Major Domo 20179, Mr. Tanner, Sharwardine, Salop, 29 guineas; Bardolph 23278, Mr. F. Colebatch, Kingsland, 26 guineas; Birley Cardinal, Mr. Vaughan, Bushley, Tewkesbury, 23 guineas; Birley Dreamer, Mr. Price, Pengelly, Brecon, 21 guineas.

Store Stock Sale at Kidderminster.

Messrs. Nock and Joseland had a large supply of stock at their sale at Kidderminster on Tuesday. The entry comprised 2,168 head of stock, including 294 cattle, 1,223 sheep and lambs, 128 calves, and 523 pigs. The fat cattle included a grand lot of prime Hereford and Shorthorn bullocks from the Temme Valley and other good feeding districts, fifteen from the Earldian Farming company reaching £23 17s. 6d. The fat sheep and lambs included some of exceptional quality; twenty grand weathers from Mr. W. Cross (Astley House) made up to 68s. each. The fat lambs made up to 48s. Store lambs met a fair demand, making between 30s. and 37s. 6d. each, whilst in-lamb ewes reached 46s. Cows and calves met a ready sale. A good proportion of store cattle changed hands. Pigs were a firm trade, strong stores being in great demand. Beef met a good demand at about late rates, whilst mutton and lamb sold readily at advanced prices.

Record Weight of a Lincoln Lamb.

On September 18 Mr. C. E. Howard, Necton Rise, Lincoln, sent a lamb to Messrs. Richardson's fat stock auction at Lincoln. It was purchased by Mr. Goodyear, butcher, High Street, Lincoln, for 76s. When killed and dressed it was found to weigh 120 lbs. The lamb was dropped after January 20 last.

Pedigree Tamworth Pigs. Prize winners at
Norfolk, Suffolk, and other shows. Champion
Cups Smithfield. Several recently exported for
Continental and Colonial herds.—**Apply R.**
OWEN GODDARD, Estate Office, Melton Constable,
Norfolk.

Clitheroe October Fair.—The old October
horse, cattle, and sheep fair at Clitheroe was held
on Thursday in good weather, and there was a
record attendance and show. Trade opened slow,
but about noon there was a general improvement.
Newly calving cattle were quickly disposed of at
prices ranging from £16 to £22; ditto heifers,
£11 10s. to £17; November calves, £16 to £22;
spring calves, £10 to £14 14s.; geld cows and
heifers, £10 to £15 and £9 10s. to £14; Irish
cattle, £4 10s. to £8; Highland Scots, £9 10s. to
£13; stirks, £5 to £8 10s.; and bullocks, £6 10s.
to £9. Sheep were shown in good numbers. Ram
lambs fetched 3s. to 50s.; shearing and two-
year-olds, 4s. to 60s.; half-bred ewes, 3s. to
45s.; Cheviot ewes, 18s. to 21s.; and Swaledales,
18s. to 22s. There was a good show of young
horses, and these were readily bought. Good,
heavy Shire horses made £30 to £50; light horses,
£22 to £32; and cobs, £14 to £23. For poorer
sorts there was little call.

Notes and Jottings.

THIS truly wonderful summer seems to have no
end to it, and so far as the sheep farmer is
concerned he is in no hurry to see a change to
something colder. Every week of such weather as
we have had since rain came, makes matters
better, for not only are young seeds which looked
very hopeless a few weeks ago, getting firmly
established, but there is a good bite on the old
leys and pastures, the late sown autumn catch
crops are coming on well, and of more importance
to actual winter feeding there is a splendid growth
in root crops which looked almost worthless. The
last month has been the best in the whole season so
far as sheep keep is concerned, and many sheep
farmers can see their way more clearly through
winter than they had reason to hope for a short
time since. Even the mangels, which had slowed
up in their growth, are finishing out strongly.

ALL this should strengthen the trade in sheep,
both fat and store; for there is not the need to
hurry out some of the nearly fat ones, and
there is a better visible supply of food for the
stores. We are optimistic of sheep farming
generally; but with the short supply of food over
a big part of the country, we thought that many
had been buying their stores quite as dearly as
circumstances warranted; it is satisfactory, there-
fore, that the weather has given them a little
unexpected help on the eve of winter.

THE Griststone is to be the name of the re-
claimed Derbyshire breed, and it sounds in
all ways better than the Vale of Goyt, the title
under which the breed made its first public
appearance at the Bakerwell Show. The name is
apt, as indicating the formation on which the
breed is most commonly met with. Registration
is to be proceeded with, and all the advantages
which accrue from a flock will go with it. It is a
most pleasing fact that no sooner is a breed
brought under registration than all associated
with it become imbued with enthusiasm, competi-
tion is set up, and the healthy rivalry ensures
improvement.

ANOTHER striking feature in sheep breeding
is the very small amount of jealousy that is
occasioned. Rivalry may be as keen as man can
make it, but criticism is always honest so far as
the individual's ideas go, and where disparage-
ment occurs it is because the man's sheep are not
correct in some essential feature. With the for-
mation of a flock look every farmer looks at his
sheep with a new eye—they are good enough to
enter, or can they be made so.

EACH one looks back to see how far the records
of his flock go, and this is no waste of energy,
for apart from the excellence of their sheep there
is no doubt that the unbroken history of Messrs.
Wright's flock was a great inducement to the
purchaser to give the phenomenal price which he
gave. That the Derbyshire men will be less keen
than others have been cannot be believed. They
have doubtless the grit to make the Griststone take
its proper place among the country's breeds.

THE wetter state of the land will call for
special attention to sheep's feet, for whilst
the sheep could walk above ground there was
little to cause foot rot; now, however, pastures
are constantly wet and soft, and where feet have
been neglected foot rot is likely to be set up early.
On arable land they sink in deeply enough to get
the skin rubbed hard enough to let the germs
establish themselves; consequently, there is need
for every precaution in the way of paring, or
running the sheep through hardening solutions,
or occasionally letting them stand on lime, as a
means of keeping the disease in check.

WITH some breeds the ewes will be getting too
forward to be turned without risk of injury
to the fetos, and the danger increases as time
goes on. As with all diseases, prevention is better
than cure; and a good stall into winter is well
worth aiming at. Clipped claws are the greatest
inducement to foot rot, and if the shepherd does
not trouble after these he will get far more trouble
later on.

BIG weights at Christmas shows are very
instructive and suggestive, but nothing
impresses one more of the great advancement in
sheep keeping than the fact that for years baby
wethers have been put on the market at this sea-
son. Baby beef is well recognised as the triumph
of the cattle breeder; but for a lamb born in the
spring, shown in the summer, and sold with the
shortened wool of a wether on it, and the weight
of a wether about it, by the time it is nine or ten
months old; all the result of the ordinary course
of farming, to us represents about the finest per-
formance in farming.

OF course the early maturity of animals, as the
result of gradual development since
skilful breeding was established, rendered it
possible; but the best skill in provision of suit-
able food and the highest form of management
are necessary to bring a flock through safely at
such high pressure. Yet, as a result of several
years' experience, it is not regarded as being any-
thing very special by those who do not remember
when it was exceptional. Although the number
of sheep kept now does not show great increase
over those of bygone years—the yearly output of
meat is greatly, almost marvellously, increased
since the time when sheep were kept two, three, or
even four years before they faced the butcher. It
is largely owing to this that so much arable land
has been kept in circulation.

THIS is a good time of year to transplant a
small acreage of cabbages for early summer
lamb feed. For earliest feeding one of the sugar
loaf type is best. There are certain risks such
as destruction by frost, wood pigeons, larks, &c., but
in view of the value of these cabbages, even though
they come only a fortnight before those trans-
planted in spring, it is well worth taking the
chances with a portion of the crop. Moreover, a
dressing with soot where there is risk of their
being eaten off will generally carry them by the
danger.

Suffolk Sheep Flock Competitions.

The result of the Suffolk Sheep Society's Flock
Competition has now been made known as fol-
lows:—

Division I. (flocks which have previously won a
cup):—Class A (flocks exceeding 240 ewes)—Chal-
lenge cup presented by Col. E. W. Baird, Mr.
Percy Eagle, of Risby, the previous holder of the
cup and the only competitor.

Division II. (flocks which have never won a cup):
—Class A (flocks exceeding 240 ewes)—Challenge
cup, presented by Mr. C. S. Wentworth Reeve,
Mr. L. F. Davies, of Herringwell, who has the
honour of holding the cup for the second successive
year. R and vhe, Sir E. W. Greene, Bart., Nether
Hall; vhe, Mr. S. Dawson, Stratton Hall. Class
B (flocks not exceeding 240 ewes, and not less than
120 ewes)—Challenge cup presented by Sir Freder-
ick Adair, Bart., Mr. C. C. Smith, of Trimley;
r and vhe, the Marquess of Bristol, Ickworth Park;
vhe, Mr. C. S. Wentworth Reeve, Livermore
Park; he, Mrs. Lowe, Gosfield Hall; Mr. A. W.
Ruggles Brise, Spaine's Hall, Baintree; and Mr.
W. F. Paul, Kirton Lodge.

The Pretzman Challenge Cup for the best ewe
lambs, Mr. H. E. Smith, of Walton Grange; r
and vhe, Mr. C. C. Smith; vhe, the Marquis of
Bristol, Mr. L. F. Davies, Mr. S. Dawson, Mr.
Eagle, Risby, and Mr. J. J. Keeble, Brantham.
Challenge Cup for the best Suffolk or Cotswold
cup, value 50 guineas, for the best flock of Suffolk
ewes, Mr. P. Eagle; r, Mr. L. F. Davies.

Mr. Percy Eagle, who has the distinction of
being the first flock owner to hold the champion
cup for two years in succession, came into posses-
sion in 1890 of the Risby flock, which was estab-
lished by his father in 1867, and is therefore one
of the oldest registered flocks in existence.

Dorchester October Fair.

There were good average supplies of sheep
pened at Dorchester October Sheep Fair, held on
Thursday, large sales being held by Messrs. T.
Ensor and Son, at 10 by Messrs. Duke and Son,
Messrs. Symonds and Sampson likewise having
their customary auction. Altogether nearly 6,000
were penned, and the sheep, as a rule, came to
hand in very fair condition, having greatly bene-
fited by the improved grasses kept they have had
compared with the barren pastures so generally ex-
perienced up to the end of September. The roots
have also improved wonderfully, and this circum-
stance naturally told favourably on business, espe-
cially as sheep are still badly wanted in many
districts.

Trade was good all through, and prices showed,
on the whole, a slight improvement on last year's
rates. Horn ewes (draft) sold from 45s. to 49s.;
flock ewes, 42s. to 50.; horn wethers, 38s. to
42s. 6d.; horn calves, 34s. to 43s. 6d.; horn
couplets, 35s. to 65s. In Downs the range was
from 32s. to 43s.; wether lambs, 26s. to 35s.;
chilvers lambs, 27s. to 33s. Everything was readily
cleared.

PIGS.

Pigs for the River Plate.

The s.s. *Saxon Prince*, which left the Victoria Docks, London, recently, carried a large number of Berkshire pigs to the River Plate. Many of them were purchased at Mr. P. H. Jennings' sale at Cockfield, and also at Mr. W. J. Chick's sale at Stratton. The others were purchased privately from Messrs. D. E. Higham and C. C. Smith, of Kingston, Lisle.

Sale of Buscot Berkshires.

A choice selection of Sir Alexander Henderson's herd of Berkshires were offered by Messrs. Thornton and Co., at the Heath Barn Farm, Buscot, Faringdon, on Wednesday. There was a large company, and the pigs were purchased to go into many different counties. For Buscot Amy, a two-year-old sow, Mr. R. W. Hudson paid 19 guineas; for Pretty Mary, winner of first prize at Dorchester, Mr. W. Harding gave 17½ guineas, and for Buscot Ethel Mr. Charles Morris's agent bid 18 guineas for their growing herd at St. Allans. Among the gelts Capt. Behreids secured one of the best, viz., Buscot Eleazar, to go to Malton, at 10 guineas. There were not many bidders on offer, but Mr. Sansom obtained First Catch at 12 guineas, and Mr. Hugh Baker Ideal, the second prize winner at Nottingham and Warwick this year, for 9 guineas. The sixty-three head offered realised £423 3s., or an average price of £6 14s. 4d.

SOCIETIES.

Hunters' Improvement.

One of the most interesting announcements made at the council meeting of the Hunters' Improvement Society held on the 18th inst. was that the representatives of the four horse societies who hold the London Spring Horse Shows had, in accordance with the instructions from their councils, met the respective managers of the Royal Agricultural Hall Company and of Olympia, in respect of the Societies' Spring Shows after 1907, and the joint committee had decided to strongly urge upon their councils the acceptance of the offer of the Royal Agricultural Hall Company, who had agreed to increase the accommodation for horses, lengthen the ring, double the seating, &c. This recommendation was adopted by the Hunter council, so that the Agricultural Hall is likely to be the scene of the London Spring Horse Shows for some years to come.

The society also considered the prize schedule for next year's show. The prize money will be £337, covering the representative classes of 1905 and 1906, but declining those for which provision was made at the affiliated shows, or which had failed to attract adequate support. The prizes throughout the riding classes were made uniform, and a new class was introduced for mares and geldings, four years old and upwards, not exceeding 15 hands 2 in.

As regards affiliated shows, two schemes of medals whose returns did not justify continuance have been eliminated, thereby retaining four schemes—viz.:—Gold Medals.—Scheme A: Brood mares; or Scheme B: Brood mares (one-day shows). Silver Medals.—Scheme C: Fillies; Scheme D: Mares and geldings.

All affiliated societies will be restricted to the offer of two medals, while the extra grant for registered mares will be withdrawn in view of the conditions applicable to schemes A or B and C. For the best hunter brood mare, and best hunter filly respectively, actually registered or entered in the Hunter Stud Book, while to facilitate competition for these medals the associated society can offer each medal in the form of a class, for which entries would be received at the ordinary time of closing.

The question of the large gold medals offered at national shows has also been considered, and these are to be continued under the conditions in force in 1906, viz., Royal Agricultural Society at Lincoln, two gold medals (a) for the best Hunter mare, four years old and upwards; (b) for the best Hunter filly, not exceeding three years old. Highland and Agricultural Society, one gold medal for the best Hunter filly, not exceeding three years old. Royal Dublin Society, spring, two gold medals (a) for the best Hunter-bred stallion, two years old; (b) for the best Hunter-bred stallion, over two years old. Royal Dublin Society, Summer, one gold medal for the best Hunter brood mare.

Clydesdale Horse.

At the last meeting of the council of the Clydesdale Horse Society a communication was read from Sir Gilbert Greenall asking the assistance of the council in increasing the prize-money for Clydesdales at the Royal Show at Lincoln in 1907. Sir Gilbert stated in his letter that if the society would renew its two champion prizes of £10 each, and give a contribution of £50 to the general prize fund for Clydesdales, he would himself contribute £10 to the fund. It was unanimously agreed to

record the thanks of the society to Sir Gilbert for his handsome offer, and to contribute the sum of £50 to the general prize fund, and to renew the two champion prizes hitherto offered at the Royal Show at Clydesdales.

At the same meeting it was reported that the entries for Volume XXIX. of the Stud Book exceed any record for previous volumes, except in XI, and the secretary was authorised to employ additional help in connection with the forthcoming volume. A communication was read from Lord Strathcona intimating that it was not necessary for the society to issue duplicate certificates for horses exported to Canada. The Customs regulations only requires that the importer exhibit the pedigree certificate, to be stamped by the Customs, and returned to him. The secretary was therefore instructed to issue no further duplicate certificates for Canadian customs purposes.

English Jersey Cattle.

A council meeting of the English Jersey Cattle Society was held at 7, Princes Street, Hanover Square, London, on Monday, the president, Viscount Enfield, in the chair, when twelve new members were elected, and accounts for the payment of prizes and expenses in connection with butter tests were recommended for payment.

The award of medals and prizes for butter tests during 1907 was afterwards considered, and it was agreed to offer similar medals and prizes as last year, the Somersetshire Show being added on the lives of the prizes offered last year to the Sussex County Show. The total sum given by the society for distribution in medals and prizes amounted to £260.

On the proposition of Mr. Richardson Carr, seconded by Mr. Weetman, it was resolved "that a sum not exceeding £100 be voted for awarding prizes to animals bred by exhibitor, sired in England, details of which to be referred to the General Purposes Committee and reported at the next council meeting."

Yorkshire Union.

A meeting of the members of the Yorkshire Union of Agricultural Clubs and Chambers of Agriculture was held at the Agricultural Club House, York, on Thursday, when the chief subject discussed was the speed of motor cars on the highway. There was a numerous attendance.

Mr. J. Booth (Pontefract) opened the discussion, moving the adoption of the following resolution of the Pontefract Club:—"That the maximum speed of motor cars be twelve miles an hour, and local highway authorities be invested with power to reduce the limit of speed through towns and villages; that the penalties be increased, and that the owner or hirer, if present when an offence is committed, be liable to the same punishment as the driver." He said they had learned a lot in twenty months. Increasing the speed limit to twenty miles had only increased the impudence of those who were determined to go at what speed they liked to the common danger. "If the speed limit was increased to forty then the fools would go at fifty, and if to a mile a minute they would find that there were some who went at nearly 100." If the speed was reduced they would reduce, if not entirely do away with, the dust nuisance and the consequent damage to property and crops adjacent to the highways.

The Chairman (Mr. E. Robinson) seconded, remarking that twenty miles an hour was too fast, and that it was not sufficient to be able to summon motorists for driving to the danger of the public.

Mr. J. W. Lett (Welburn) moved as a rider to resolution the following portion of a resolution passed by the Malton Club:—"That the revenue raised from the licences granted in respect of motors be handed over to the authority issuing the same, to be applied by them (or some central authority acting for a group of authorities) in aid of the maintenance of highways under their control." He thought they ought to bring pressure to bear on the authorities to see that the present laws were enforced."

Mr. T. N. Driffield (Brampton) also moved another rider, which also formed part of the Malton Club resolution, viz.:—"That motors be assessed to duty on a scale according to horsepower." Both riders were accepted by the mover of the resolution.

Mr. W. W. Lupton (Old Malton), however, moved an amendment that the limit be fifteen miles an hour, and this was seconded by Mr. J. Bulmer (Ryedale), and on a vote being taken the amendment was carried by a majority of two votes, and the resolution, as amended, was then adopted.

A resolution was carried protesting against the present limited application of the Sheep Dipping Orders, and requesting that they be made compulsory throughout the United Kingdom and Ireland, whilst a discussion of the Land Purchase Bill was deferred, it being stated that Mr. Jesse Collings had promised to address the Union on the subject at a future date.

The First of the Small Holdings on Crown Lands.

It will be remembered that when Earl Carrington announced his scheme of Crown lands for small holdings, it was mentioned that one of the first of the undertakings would be carried out by Mr. C. D. Rose, M.P. for Newmarket, in Cambridgeshire, as an experiment bearing on the value of the system of small holdings as a means of checking the flow of labour from country districts to the towns by improving the conditions and prospects of the rural population. The land, which Mr. Rose has acquired on a thirty-one year lease for this purpose, is very nearly a thousand acres in extent, and is situated on the borders of Cambridgeshire, between the villages of Burwell and Fordham. Mr. Rose has arranged for the Crown to expend about £1,500 upon the enlargement of the labourers' cottages, where required, the construction of dairies, stables, &c., and the adapting of the buildings for the use of small holders.

The allocation of this land has now been made, and about fifty small farmers, farmers' sons, agricultural labourers, and village tradesmen have entered into possession. Mr. J. H. Biggle, of Monlton, Lincolnshire, who has had experience as steward and surveyor to the South Lincolnshire and the Norfolk Small Holdings Association, was entrusted with the preparation of a scheme for the division of the estate. Applications were so numerous that the claims of men living outside the immediate neighbourhood had to be rejected. All the occupants were drawn from within a radius of about five miles from Burwell. Arrangements were made to divide the estate into fifty lots, and these were apportioned as follows:

Thirteen small farms averaging in size a little over 50 acres each, with each of which certain house, cottages, and farm buildings will go. Thirteen acres are reserved for allotments in addition to 20 acres which were already let out in half-acre allotments, a field is to be set aside for pasture for the use of cowkeepers, and the rest of the land is let to residents in the village of Burwell in lots varying in size from 3 to 20 acres.

The system of management which is to be most encouraged is the keeping of cows and the breeding and fattening of all kinds, with a view to keeping the somewhat thin soil well manured and in good heart and condition. The quality of the soil is the least satisfactory feature of this enterprise, and it is only by keeping the land in a high state of cultivation that the best results will be obtainable, and this seems like a handicap to the smaller tenants.

The opinion is freely expressed by persons familiar with land cultivation both in Burwell and Fordham that the soil is not suitable for the experiment, but those who have secured lots seem satisfied, and do not regard the rent, which averages about 25s. an acre, as too high. Lime and chalk abound in the district, and the soil is decidedly light, but it seems to grow both corn and roots satisfactorily.

The Farmers' Club.

The first meeting of the Farmers' Club after the recess will be held at the Whitehall Rooms, Hotel Metropole, S.W., on Monday, November 5, at 4 p.m., when Mr. John McLaren, of Leeds, will read a paper entitled "Farming Implements in their Relation to Labour—a Retrospect."

The annual general meeting of the club has been fixed as usual during the Smithfield Cattle Show Week, and will be held at the Whitehall Rooms, Hotel Metropole, S.W., on Monday, December 11, at 6 p.m., when a paper will be read by Mr. H. Trustum Eve (secretary), entitled "Freedom in Farming, with Special Reference to Selling off Produce."

The annual dinner will be held on Tuesday, December 11, at the Trocadero, Piccadilly, W.

The committee invite suggestions from members as to subjects for papers to be read in 1907, and as these suggestions will be considered at the next meeting of the committee, it is important that they should be received before November 5.

At Ely October Fair on Thursday there was a good supply of horses, and good animals met a ready sale. Agricultural and van horses made up to £45, and nags up to £40. There was also a good lot of Welsh and other ponies, up to £10. Stock were rather a dragging sale, yearlings going at £5 to £7, and stores at £5 to £10. Really good cows were picked up with avidity, realising £8 to £20.

Rufford Estate, situated between Preston and Liverpool, the property of Sir Thomas Hesketh-Bart., comprising over 3,300 acres, was offered for sale on Wednesday. The estate includes Rufford Hall and park of 600 acres, 1,000 old hall, two hotels, fifty farms, and numerous residences, altogether producing about £7,000 yearly. The estate was first offered as a whole, but withdrawn at £2,000. Only one farm was sold, the bidding being very poor.

By Lupulin.

The "Mark Lane Express" Hop Reports and the Maidstone Farmers' Club.

The following communication has been received by the Editor of the MARK LANE EXPRESS—
1, Market Buildings, Maidstone.

October 22, 1906.

SIR,—I am directed to forward you a copy of the following resolution which was passed at a meeting of this Club and chamber, on October 18, 1906.

I have the honour to remain,

Your obedient servant,
PHILIP CHAMPION,
Hon. Secretary.

"Attention was called to the hop trade reports that have recently appeared in the MARK LANE EXPRESS, and it was resolved to call the attention of the Editor to the inaccurate and misleading nature of the same, and to ask him to publish truer and more accurate reports in future."

To this the Editor has sent the following reply:—

DEAR SIR,—I am in receipt of your communication of the 22nd inst. conveying a resolution condemning our Hop Intelligence. I should be glad if you could give me some specific report to which exception is taken, or at all events provide me with more data than just the bare resolution.

Yours, &c. —

As no answer has been received to this note, and as I am held responsible for the hop reports in this journal, the matter has been referred to me. The words "inaccurate and misleading" are sufficiently strong to convey to me (if they were true) a very severe reproof, as they imply an accusation of intentional or careless wrong doing. But I must be permitted to emphatically repudiate them. My contributions on the subject of the hop trade are founded on such facts as I can ascertain from growers, factors, merchants, and brewers. Not from only one, but from many sources I seek my information, and knowing how far these may possibly be effected by unintentional prejudice, I am careful to weigh them all up in order to present to my readers a digest of truth as nearly as I can arrive at it.

I am willing to admit that it is sometimes, and perhaps frequently, difficult to ascertain reliable facts in this business, in which so many contradictions are existent. But I am prepared to stand by any statements I make, and do not hesitate to challenge any critic who differs with me.

The truth is not always palatable, and I fear that the objection taken to my reports has this basis. My sympathies are and have constantly been with the growers, whose special interests I desire to promote, but I cannot be persuaded that I should be doing them service by putting forward false or garbled statements for the mere purpose of pleasing them.

Our past history has frequently proved that the industry has deceived itself in "imagining a vain thing," in grasping after the unattainable, and in the shouting of loud words, coupled with blindness to the changes of circumstances. The syndicate of last year is an apt illustration. Commenced with the encouragement of the prospect of success, it failed in the end, because its members refused to recognise the altered condition of things, and very heavy loss resulted. The conditions are not now dissimilar. We have a small crop, which should naturally put growers in the safe position of expecting and demanding high prices for their limited produce. Personally, I would rejoice to see them in this position, but I cannot honestly lose sight of other facts.

Our eventual customers, the brewers, have been well supplied by the superabundant growth of last year, large importations have arrived, and continue to arrive; the information I get from all parts of the hop-growing world convinces me that our competitors have large quantities to send to this, the only great, free market. With these facts staring us in the face, how can we expect that our legitimate desire for higher prices can be fulfilled, and how can I, as a faithful re-

porter, attempt to mislead my readers by glossing over what I conscientiously believe to be true? Should I do so, I might then plead guilty to the charge made by the Maidstone Farmers' Club; but as it is, I am only in the position of being mis-understood, and therewith I remain content.

The eternal laws which have always governed and will continue to govern the commercial world, are more powerful than any resolutions formulated by the most influential private gathering, and I am confident that if our industry is to prosper in the future, facts must be acknowledged and faced, however unpleasant and difficult they may be. So long as I am permitted to write in the columns, I shall do so to the best of my ability, honestly and fearlessly, believing that by this course I shall best serve the interests of those, for whose well-being I have striven through a long series of years.

The Turn of the Tide.

A great change has come over us here in the Borough. After dolefully watching the "slack water" until our patience and our hope were almost exhausted, we heard from afar the rush of the incoming tide, and our hearts responded cheerfully, as we saw the prospect of movement out of the "doldrums," in which we have been held captive so long.

Worcester gave us the first signal, as we learned that at that market, held on Saturday, the 13th inst., a large quantity of hops had been sold. The dead water was stirred by the operations of the largest local buyer, who accepted every pocket he could secure at his own valuation, which, we may be sure, was not higher than he could possibly get accepted. Fired by emulation, some London merchants warmly assisted in the work, other local buyers followed suit, and the market closed with the conviction that the clouds were rolling away, and that a brighter time was at hand.

Values naturally became firmer, and when business began in London the following week the tone of affairs was speedily altered for the better. Many growers were in town, and the merchants were active, making bids in most cases their offers were declined, holders being very firm in their demands for advanced prices. Throughout the week the activity continued, with the result that values may now be quoted at least 20s. above the lowest point to which they had fallen.

During the past week we have had the Brewers' Exhibition, bringing many of our country customers to town, but as they are chiefly interested in the show at Islington, they do not give much of their time in the Borough. However, despite this drawback, a fair amount of business has been done, although there is some relaxation from the activity recently prevailing. I hope and expect that we shall soon see the full flow of business re-established. Holders seem to be rather more willing to listen to offers, and buyers are ready enough for trading, as their clients are placing orders, which, though not large, are sufficient to encourage merchants to look round for hops.

I hear also that the agents of several of the largest brewers have visited the market, and as some of the bigger growths have been dealt with, and others are coming forward, I think we shall soon know of some important results. But, unfortunately, prices do not advance. They remain steady, and that is all that can be said. I am prepared to see in the near future an improvement in values, and although it may be but slight, it will be welcomed as a possible indication of better times to come. In the meantime I would respectfully suggest (*pace* the M.F.C.) that holders should keep their eyes open wide lest perchance they be caught napping. They have powerful and wily foes in the field, who will not hesitate to seize the favourable moment to get an advantage.

A man who stands strong "upon the rock" of his going, sometimes is not able to go at all, the moral of which seems to be—as soon as a holder gets a favourable offer let him take it. If he does not sell all, let him sell part, and so diminish his risk and secure something for himself.

What is the Borough Doing?

The answer to this query is not difficult, as unfortunately the unsatisfactory conditions of the last fortnight continue. The feeble movement that appeared a few days ago, and that induced me to refer to the possibility of a gleam of brightness breaking through the clouds, speedily collapsed, and has been succeeded by a renewal of dullness most painful to all concerned. Therefore the Borough waits. How the occupants of the several offices really occupy their time it is not pleasant to attempt to describe. Efforts to sell are almost fruitless. Should a possible buyer be seen in the street, his appearance is welcomed by hungry factors, and his course watched earnestly. If he pays a visit, it is usually rather friendly than commercial, and thus the time was wearily on, without any present results, and almost devoid of any faith in the early future. Some faint hopes were aroused that the unexpected and exceptionally low official esti-

mate of the crop recently issued might stimulate the trade, but thus far no such effect has been produced. Men are now saying that when the figures have reached and been appreciated by brewers, some demand will be thereby created, and in the course of a week or so we shall hear something about it. "So mote it be" is the sentiment that fills the minds of all our traders, who have hitherto only experienced a most disappointing season.

There is a slight evidence of light in the conviction that, although demand is still absent, the market is perhaps a little steadier. The down grade was so prominent as within the last day or two been apparently arrested. The market car that seemed to be running away down a dangerous slope, is feeling the action of certain brakes, and its career is for the moment suspended. When we know that quotations of 90s. to 95s. have been current, and that 80s. to 85s. have been almost anticipated, we must admit that the time has arrived when the brake should be put on with a strong hand. Therefore, having realised the danger, let us hope that it has passed away, and that henceforward our course may be on safe and still safer ground, our confidence being increased, and our stability made manifest.

The Reclamation of Hops.

There is hardly any necessity to emphasise the accepted truism that preventable waste of any useful material is reprehensible. It is, however, abundantly evident that, even under our present advanced conditions of scientific knowledge, there are still remaining many so-called waste substances which must eventually be recovered and brought into use, and we are constantly being reminded of this fact by the revelations that are made from day to day, proving that thoughtful men are aware of the need for further investigation, so that we may carefully follow the example of Nature, in whose operations no waste is permissible.

One of the most recent instances of the utility of these inquiries has been brought under my notice, and is at once commended to me as worthy of the attention, not only of the industry whose interests I seek to promote, but of our customers who consume our produce. We expend much labour, money, and thought in training, cultivating, and curing our hops, and we hand them over to the brewer in the best possible condition for his purpose. He throws them into his coppers, and, as far as he can, extracts from them their preserving and flavouring contents in the manufacture of his beers. When he has done with them he describes them as "spent," and has to make some provision for getting rid of them. They are now a burden to him and he must needs incur considerable expense in removing them. It is here, however, we have discovered that these apparently useless hops have not been exhausted of their lupulin, but still retain in the nut or seed sufficient of the bitter principle, to make it well worth while to deal with them further. A process has been devised and patented with this object in view, and now that I have seen its details, I am struck with its simplicity, and am surprised that it has been neglected so long.

It is universally admitted that the value of hops in the brewery is measured by their richness in lupulin, and much discussion has arisen as to whether the presence of seeds does not minimise the efficacy of this necessary element. But it has apparently been overlooked that this precious material is furnished by Nature as food for the fruit or seed, the main object of all plant growth being the reproduction of its kind. Fertilisation must be accomplished, and in the case of the hop, this is brought about by the pollen of the male plant. The natural course of growth transfers the lupulinic food to the immature seeds, and they rapidly increase in bulk until the ripening period has arrived, when they represent about 12 to 15 per cent. of the weight of the cured cones. These being pressed or thrown away as waste, the inventors of the process under consideration propose to reclaim them and utilise the valuable properties they contain. In order to do this a machine has been devised, consisting of a revolving cylinder, heated by steam, the outer circumference of which is formed of metal, perforated sufficiently fine to allow only the hop seeds to escape. The wet, spent hops being placed in the cylinder, it is set in motion, and very speedily the contents are perfectly dried, and the whole of the seed is separated from the petals and deposited in a receptacle provided to receive them. The dried seeds are then crushed through suitable rollers, and from them a valuable product, containing the essential oil and the bitter flavour, is extracted by further boiling. As far as the brewer is immediately concerned, the object of the invention in avoiding the waste of hops is thus secured, but there remain other purposes to which these hitherto valueless materials can be applied, and from which profit will accrue. The dried petals or bracts, being deprived of the hard seeds, can now be bleached and used for making white paper, their fibrous character

being very suitable for this purpose, while from the strigs, brown paper can be made. Experiments have also shown that by calcining the dried petals, an excellent vegetable black, used by painters and manufacturers, can be produced. The new process, therefore, offers an attractive prospect for profitable enterprise, and I cannot doubt that when its merits have been practically tested, it will develop into an important industry.

With regard to the possible results of this invention, as affecting the interests of the English hop growers, I cannot at present see the possibility of any injury thereto. Indeed, the reverse is more probable, as the area of use for their produce will be enlarged. We are at present limited as to our outlets, but we may hope that the demand for the new process, which will be better encouraged to buy hops, and we may hope that the demand for them will be increased.

Another point may perhaps be considered. As the hop seeds can be thus utilised, the objection to their presence in the cones will be entirely removed. Their weight is profitable to the grower, and when the brewer knows that there is further gain to him by treating them as proposed, he will cease to cavil at their proportion being too large. It is for these reasons that I am interested in this matter. I may add that an influential syndicate has been formed for working this invention, and if any of your readers desire further information concerning it, I shall be pleased to arrange for the satisfaction of their inquiries.

NOTES AND NEWS.

A Pig Club and its Secretary.—J. MacDonagh, formerly secretary to the Wiltshire Pig Insurance and Provident Association and the Wiltshire Pig-keepers' Co-operative Trading Society, Limited, Trowbridge, was on Tuesday at Trowbridge charged with having embezzled in July last, while acting as secretary to the above-named associations, the sums of £3 13s. 4d. and 19s. 2d., the monies of the associations. After formal evidence he was remanded.

Ashbourne October Fair for cattle, sheep, and horses was held on the 26th ult., when the best calving cows made up to £21; ditto, secondary, £15 to £16; and calving heifers, £14 to £16. A good show of sheep met with a good market. Store ewes made 47s. to 50s.; store lambs, 28s. to 35s.; rams, £4 to £8; ram lambs, 50s. to £5 each.

At **Harnsey** on Thursday a Leeds hawker named John Taylor was convicted of obtaining 11s. 6d. by false pretences from Mrs. Hetty Morris, a shopkeeper. Defendant called at her shop, and sold her at 1s. per lb. a quantity of "butter," which he represented as "splendid

butter," churned that morning at a farm near Ardsley," but Mr. George E. Smith, public analyst for the borough, said it was margarine. The Bench described the case as a most serious one, and sent the defendant to gaol for one month.

In the course of a lecture given at the Royal Agricultural College, Cirencester, Mr. Jesse Collings, M.P., referred to the present unsatisfactory condition of agriculture and its grave effects on the national life, and said the remedy for that state of things was land reform, a reform under which where we now had one owner of land in this country we should have a thousand. The system of landlord, tenant, and labourer had been discarded by every country but our own, and as far as Great Britain was concerned it had broken down.

Yarm Fair.—Owing to inclement weather the attendance at Yarm Fair which extended over three days, was somewhat smaller than usual. There was a good show of cart horses, which were in demand, four and five-year-olds being from £30 to £45 each; two-year-olds, £35; and yearlings, £20. Roadsters were well sold at from £30 to £45 each. There was a quantity of inferior animals, many of which changed hands frequently at various prices. Stags fetched from £12 to £16 each. There was a large quantity of cattle, but business was somewhat slow. The Irish cattle were of an exceptionally good quality, the prices ranging from £8 to £12 each. For English cattle there was a little better demand, and from £9 to £14 was obtained, good bullocks realising £15 each. Milking cows fetched up to £20 each. There was a good show of sheep, but only moderate demand. Leicester tups sold at about £5 each; shearling tups, 90s.; half-bred ewes, 40s.; half-bred shearling gimmers, 45s. to 50s.; half-bred lambs, 20s. to 25s.; and Scotch ewes, 18s. to 24s. Irish cattle met a slow sale at £7 to £12 each. Wensleydale cheese, flats made 6½d. to 7d. per lb.; Stilton shapes, 7½d. per lb.

For the convenience of exhibitors at the International Poultry and Pigeon Show, to be held at the Crystal Palace on November 13 to 15, 1906, the London and North-Western Railway Company will make arrangements for through vans for the conveyance of poultry, &c., to be run to the Crystal Palace on Monday, November 12, from various of their stations, details of which, as well as rates for the conveyance of traffic, can be obtained at any of the company's stations. On Monday, November 12, for the convenience of exhibitors attending the show, a through third-class saloon-carriage will be attached to the 8.30 a.m. from Carlisle and the 4.16 p.m. from Willesden, due Crystal Palace 5.2 p.m. Another saloon will be attached to the 12.0 noon train from Liverpool (Line Street); passengers from the Manchester district can join the litter at Crewe, departing 1.5 p.m. This saloon and through vans, except that from

Glasgow, will be worked specially from Willesden Junction, and be due to arrive at the Crystal Palace at 6.25 p.m. The Glasgow van will be attached to the 6.42 p.m. Through train from Willesden to the Crystal Palace due 7.27 p.m. Arrangements will also be made for the return of the traffic in through vans at the close of the show. All information can be obtained of Mr. Robert Turnbull, Superintendent of the Line, Euston Station, London.

Vacant Crown Lands.

The report of the Commissioners of His Majesty's Woods, Forests, and Land Revenues, just published, shows that in the financial year ended March 31, 1906, the total receipts for woods, forests, and land revenues, inclusive of £11,091 15s. 1d. brought forward from the previous year, amounted to £963,537 19s. 1d. The total expenditure in connection with the administration of the Crown properties amounted during the twelve months to £151,394 11s. 1d.; payment was made to the Exchequer of £180,000; and a net balance remained of £32,143 8s.

With reference to the agricultural land administered by the Commissioners, it appears that the land in hand for want of suitable tenants consists of 4,280 acres—917 acres in Cambridgeshire, 768 in the Isle of Wight, 400½ in Oxfordshire, 337 in Lincolnshire, 1,174½ in the Isle of Sheppey, 572 in Suffolk, and 16½ acres in Surrey. These farms and lands are cultivated and managed by practical farm bailiffs, under the immediate supervision of the Crown Receivers, a sufficient staff of labourers being employed on each farm. As to their suitability for small holdings, Mr. J. F. E. Horner, the Commissioner signing the report, says:—

I have had some negotiation for letting the farms for small holdings, but at present only one farm has been considered by the applicants to be suitable for that purpose, and for that one negotiations are still proceeding.

It may probably be to the advantage of the Land Revenues that a farm that is in hand and being cultivated by this Department shall be let for small holdings or otherwise, but it must be remembered that on a letting for small holdings of a farm that is in cultivation as one holding practically all the labourers employed thereon are displaced, as it seldom happens that men of that class have the means to become small holders, while small holding tenants do not usually employ regular labour outside their own families.

It thus may easily happen that as many labourers with their families and dependants may be displaced upon letting for small holdings a farm previously managed as one holding as will be provided for by such small holdings. If the farm is let as one farm, the incoming tenant would usually retain the labourers, or most of them.

THE GUARDIANS of the POOR of the PARISH of ST. MARY, ISLINGTON, are desirous of receiving TENDERS for the purchase of BRAN and POLIARD arising from the grinding of Wheat at the Cornmill Road Workhouse, Upper Holloway, till the 23rd of March, 1908.

Soloed Tenders, endorsed "Tender for....." and addressed to the Guardians, must be delivered to the Guardians' Office, St. John's Road, Upper Holloway, on or before WEDNESDAY, the 7th of NOVEMBER, 1906.

Printed Forms of Tender, with conditions of contract and estimates of quantities required, must be obtained from the Clerk, as no others will be received.

The Tenders will be opened on Thursday, the 8th day of November, 1906, at a Meeting of the Guardians, who do not bind themselves to accept the lowest or any Tender.

By Order,

EDWIN DAVEY, Clerk.

The Guardians' Office,
St. John's Road,
Upper Holloway, N.,
25th October, 1906.

HAY FOR SALE.—Three Stacks of Sainfoin and Lucerne and Meadow Hay, about 70 loads; 20 miles from London.—RUTTERS, 10, Norfolk Street, Strand.

SITUATION WANTED as ESTATE FARM BAILIFF; thoroughly experienced in all branches of farm and estate work; fourteen years in present situation as bailiff of nearly 2,000 acres, under James Forrester, Esq., the resident agent to Viscount Portman's Dorset estate; excellent references.—Apply, J. K. BESANT, Bryanston Farm, Blandford.

DRUMHEAD COW CABBAGE PLANTS.—Strong, well-rooted, autumn sown; Robinson's Champion, 6d. 1,000; 10,000.—SALE & SONS (established 1818), Wokingham, Berks.

32/6 each.

Six Prize Medals Awarded.

Seasonable Topics.

The Voice of Agriculture. PLEADING and plaintive is the voice of agriculture, the most important industry in the country, instead of being strong, powerful, and commanding as it ought to be; in fact, a veritable power in the land. Agriculture asks for things as favours which it ought to demand as rights, and its gentle murmurs have been heard so long that they have little or no effect on the powers that be. We hear of resolutions being passed at Chamber of Agriculture meetings against the extravagant expenditure of county councils on education and other matters, and when received by these great bodies they are allowed to lay on the table without comment, so great is the notice taken of them. In the same way the requests and resolutions sent from agricultural bodies to Westminster are pigeon-holed away and little more is heard of them till election time, when the farmers' vote is secured on the strength of promises. Dear, dear, it is really surprising how important agriculture is at election time, and how its importance fades when the fight is over and one or the other party is safely in.

Autumn Ploughing. AMID all the changes that have come over agriculture as centuries have rolled away the plough remains, as it ever was, the implement essential for the production of corn and other crops. In make and detail the plough of to-day differs from the plough of the Bible, but the principle is the same as well as the object of use. We are told that steam or petrol will take the place of horseflesh to supply motive power for the plough, just as the railway train has supplanted the stage coach, but the change will not take place yet, and in the mean time we must follow the old order of things. We well remember what a local sensation the steam cultivator caused when it first appeared in our district, but it has never got anything like a monopoly. The presence of steam tackle in fields is common enough at this season, and the power is excellent for working neglected land, deepening cultivation, and breaking up stubborn plough pans, but the steam engine is not everybody's implement for ploughing, and cannot take the place of the horse-drawn contrivance. Get your ploughing done early is good advice, particularly if the medium be retentive, and we like to see the end of it before December is very old in order to get the soil exposed to the pulverising influences of the atmosphere. Another advantage of autumn ploughing is that you can get on the ground almost at any time, whereas after Christmas the land is often so wet and sodden that the work is impossible, or more harm is done than good.

Root and Grain Shows.

WHILE writing we have before us the schedule of the forty-fifth annual show of a county root and grain society which is to take place shortly, and we are reminded that the exhibitions of similar institutions are now being held in various parts of the country. Forty-five years! It is a long time to look back upon, and we can only form a mental idea of the conditions under which the first show of the society referred to was held. One thing we know, that acres of land which probably grew the grain for the first shows have long been put down to grass, and then the man in the street was not as independent of the British farmer as he is now for his flour and his bread. Forty-five years ago it is fairly safe to assume that the mangels and turnips were grown entirely with dung from the stockyard, not hurried into great size as now by means of nitrate of soda and other powerful fertilisers. Whether the roots of the present are any the better is a matter for conjecture. All the same, the grain sections of these autumn exhibitions ought to be good this year after so fine a harvest time, and roots will doubtless be better than was at one time anticipated, as the October rains have helped them along wonderfully. We wish the root and grain societies of the country all success, with the hope that the old ones will keep up their vigour, and that younger institutions will grow in strength and usefulness.

The Value of Lime.

IT is significant of the fact that things are not quite as they should be when an authority like Mr. A. D. Hall, of Rothamsted, expresses regret that the good old practice of thoroughly and heavily liming the fields as carried out fifty or sixty years ago has gone greatly out of fashion. This shows that the old farmers' rule of thumb workers though they might have been, carried out an operation that is upheld by some of the greatest scientists of modern times. The advantage of periodical liming as set down by Mr. Hall were given in the MARK LANE EXPRESS for October 22, but we need not go back half a century to remember the time when farmers pinned more faith on this indispensable material than they do now. We can point to a dozen places within a small area where lime kilns once flourished, and remember the time when lime drawing was a regular annual task for the farmer's team, all well within the last half-century. According to Mr. Hall the fertility of many of our fields to-day is due to the liming and chalking that was done by the farmers of the eighteenth and earlier centuries. If we are reaping the benefit of what our forefathers did in the way of liming, how will our

grandchildren be affected? Will they have reason to bless this generation for the lime applied to the land? We fear not unless a return to old customs become more general. Little cost and quick returns is the order of things at present, and since basic slag and other artificials came in so much there is no doubt that lime has largely gone out.

Sowing Wheat.

FARMERS have been busy of late getting in their wheat, and the rains of October put the ground in excellent condition for drilling in the seed. The methods of preparing ground for wheat are as numerous almost as the days in the year, and they vary to suit the conditions of soil in different localities. In all cases, however, the object should be to put the seed on a clean, firm, seed bed and preparatory cultural operations should lead up to this. Rotations are various. We have recently seen wheat being sown after potatoes and going in splendidly. Wheat also follows barley and invariably does well, because though both crops require practically the same food the barley is a surface feeder, while wheat roots go more deeply into the ground. Clover is a good predecessor for wheat, because the long roots of the former bring up food from the subsoil, and when the grain is sown amongst the ploughed-up clover roots the necessary firmness of the seed-bed is obtained.

The Spirit of Competition.

WE have on a previous occasion referred to competition as being a means of education and improvement amongst people connected with agriculture. Perhaps, from a business point of view, the spirit has in some cases been stifled by an overwhelming weight of conservatism which prompts certain farmers to follow in the footsteps of other farmers though the game may be a losing one, but broadly speaking there is plenty of evidence to show that the spirit of competition is very much alive in agriculture. One of the best aims a man can have is to always produce the best and beat at the top. The fight for the top place is always a good thing, because if a man does not get it, he obtains something, and is better for the struggle. The spirit of competition asserts itself in all branches of farming—amongst wealthy breeders who will honour with pedigree stock, farmers who distinguish themselves at local shows with agricultural products, roots, &c., and labourers who strive to defeat their fellows in manual processes connected with farm work. Our farmers and agriculturists is to encourage and foster this

spirit of competition, and if possible put still more life into it, because we are convinced that it would be a bad day for farming if it were allowed to remain dormant or die out.

Fruit Trees on Arable Land.

COULD cornfields and arable land generally, be more utilised for the culture of standard apple and pear trees? The question is an open one, and like Rosa Dartle, we only ask, being prompted to do so through seeing in the West of England, in Hereford and Worcester giant specimens of pear trees dotted about the cornfields and land under arable culture. Perhaps the system first originated in the days when most of the land in the district was under the plough, and corn-growing was a profitable occupation. We take it that the farmer needed pears for his perry, so he conceived the idea of dotting trees in rows and otherwise on his plough ground, in order to get both fruit and corn. In these days there may be no reason to scheme like this, but that the conditions suit the fruit trees is demonstrated in the presence of hundreds of specimens growing on land that has been under the plough ever since they were planted, and in spite of age they are still vigorous,

and every year they help materially in the filling of the perry casks.

Lifting and Storing Roots.

THANKS to the rains of the mild weather, mangels and swedes are bigger, and the crops heavier than they promised to be about Michaelmas time. It was desirable to let the roots grow as long as they would, but now that November is here, and there is a possibility of frost at any time, it is time that mangels were safe in their winter quarters. Others share this opinion with us, and of late we have seen a number of farmers taking advantage of fine days for getting up their roots. Care is needed in the storage of mangels. Not that they require any coddling, but the great thing is to avoid storing any diseased specimens, which will soon contaminate a whole heap. Sound mangels rarely fail to keep well in clamp, provided they are got up in good condition—not injured by frost—and are provided with free ventilation to get rid of the sweating that always accompanies the lifting process. Though mangels are better than was at one time anticipated, they are in many cases a light crop, and every root will be valuable before the winter is over.

send out for the purposes of his experiment—for experiment it can only be—ought but the best—equipped families, best—equipped mentally, physically, and morally, as well as in the agrarian sense, to be found within the dual area? Let us assume that his Grace has conferred a benefit upon the Orange Colony by adding this human material to its sparse population; but, if we confess that, we must ask how has his action affected the depleted country-side from which it has been withdrawn? We are all now for making small holding experiments. The Government, by the way, needs the lessons derivable from experience as a guide to their legislative purpose. What if a hundred and fifty thousand pounds had been spent in this direction? What if a hundred and fifty thousand pounds were at the disposal of those who are seeking to evolve a complete scheme of a co-operative agriculture? What if a hundred and fifty thousand pounds were at the disposal of those who would link up villagedom with the great railway centres? You have in these suggestions an admixture of practical investments and philanthropy. Small holdings and allotments are an investment, and men like Major Poore, in Wiltshire, and Earl Carrington, in East Anglia—the one a local Conservative leader and the other a Liberal Minister—have shown what a wise financial encouragement may do for the economic redemption of the rural workers' position, and moreover, what an influence it may be in stimulating affection for the country-side in the halo of mind and limb. May I commend their example to this generous-hearted Duke of Westminster.

Agricultural Politics.

BY A LOBBYIST.

Mr. Ailwyn Fellowes and his Assailants.

(Of course, I have nothing to do with mere partisanship, with the retaliatory accusations, baulked ambitions, and embittered prejudices of the henchmen of this or that party. I do, however, sincerely deplore this attempt to attribute the notices given to the allotment-holders upon the De Ramsey estate in Huntingdonshire, and the prospective increase of rent to those to be readmitted to those allotments to the chagrined malice of the Hon. Ailwyn Fellowes, as a consequence of his defeat at the General Election. I have watched Mr. Fellowes' political career from its inception—there are personal reasons for this; I closely followed the incidence of his policy as Minister for Agriculture. To a courtliness of bearing that has an old-world fragrance associated with it he adds a chivalry of intention that has in the past refused to be allied with the grossnesses of political warfare. As Minister for Agriculture his revealed sympathies were sufficiently broad to enable him to take an interest in the weal of every human element connected with the land. He was no advocate of that extreme landlordism which, now defunct, believed in the retention and extension of grand seigniorial privileges and demands. His policy was that of a receptive-minded man, whose generous instincts were fully alert to the denudation of the villages, who lamented the anxious, fascinated gaze which too many of the villagers directed towards the towns, and who was solicitously desirous of doing what he could to arrest the migratory tide. He is no chameleon-tempered man. He is not of the texture which would make of a Mr. Hyde in Parliament a Dr. Jekyll out of Parliament. What may be the purpose of Lord de Ramsey, the brother of Mr. Ailwyn Fellowes, in practically abandoning his allotments, I do not for the moment inquire. All I know is that to attribute this to the malevolence of Mr. Ailwyn Fellowes is to show a woeful misappreciation of the character of as generous a warrior as ever knew how to bear defeat in the electoral lists gracefully and manfully. When I recall the accusations of the week I souchow cannot but revive Ben Jonson's famous lines:—

"It is a note
Of upstart greatness to observe and watch
For those poor trials, which the noble mind
Neglects and scorns."

Mr. Ailwyn Fellowes does not need this defence in the household of his friends. I have been induced to make it as one beyond its portals who has watched his career.

Will the Lords Fight the Bill?

There can be no doubt whatever now about the attitude of the Conservative rank and file towards the Plural Voting Bill, and there is no doubt whatever, too, that the tremors bred of its introduction are chiefly the result of anxiety as to the electoral future of the rural constituencies. Frankly, I did not

think that the antagonism directed towards the Bill in the Commons was particularly intelligent. As a piece of obstruction, it might be clever to declare that the Bill would disfranchise many a working-man, who, enjoying the fruit of property as a result of his own providence, desired his property-vote to be retained. As a fact, if that property be far removed from the thrifty working-man's home he would be unlikely to mulct himself in the heavy expense of a railway journey and a day's maintenance, together with the loss of a day's pay—and this he must do under the Corrupt Practices Act—for the purpose of recording his vote. It would have been better to have met the position with the blunt, direct declaration that property has its rights as well as its duties—to revise the aphorism of the great Irish administrator, Thomas Drummond—and that one of those rights is the right to vote. It would have been better to declare that it was more necessary than even in these days of democratic assertiveness to protect this right. This argument—and it could have been given a score of Pro-ean guises—might have touched the national intelligence. To be quibbling over minor issues, and to be afraid to utter the real thought that was behind all this quibbling, did nothing more than amuse. Of course, Sir Edward Carson adopted a bolder line when he declared that this is a Bill for the disfranchisement of the anti-Liberals. Well, this was by its effect. What, thus, will the Lords do? And the peers are now the real and only effective representatives of the county spirit in Parliament. Will their appetite for the slaughter of Radical achievements be sated by their emasculation of the Education Bill? Or will their appetite be only whetted? Well, I repeat that the effect of this measure, if carried, will for the moment be—and nowhere is this appreciated more keenly than in the Conservative council chambers—the banishment in a great degree of Conservative representation from the counties. Will the Lords think the issue worth a fight? Of course, they would be accused of being merely hewers of wood to Toryism. After all, however, this is a Bill designed to joy the heart of the Radical electioneers of the shires.

Denuding the Land of Healthy Labour.

Of course, it would be capacious to criticise the action of the Duke of Westminster—as the daily Press tells us he has—"spending £150,000 on an estate in the Orange River Colony, which he has equipped with farms and machinery." "He has also," saith the faithful journalistic chroniclers, "sent out eighteen families." "What business is it of yours?" I may be asked. "Surely it is a matter for the Duke's own private concern?" Wherein the general significance of the incident lies in the light it throws upon the tendency of this estimable pro-colonial and not-so-estimable emigration sentiment. It is not to be assumed that the admirably-intentioned nobleman would

England and the Butter-Fakers.

"England wants pure butter." This is the opinion of no less a commercial personage than the president of the Grocers' Federation, a man who, on such a subject as this, must speak with complete and entire knowledge. I commend his assertion to Earl Carrington in the hope that it will still further vivify his own comprehension of the necessity of anti-faking legislation. The commercial magnate based his remark on his conviction that the butter-consumers of England are setting the brazen-face of antagonism towards doctored butter, or against concessions that are not butter at all, but masquerade in the guise. Now the Netherlands may be said to have been the pioneer land in the very remunerative but very discreditable art of butter-faking. Its ability in this direction has not been in any way moderated, and its moral sense has not in any way been quickened to a comprehension of its indecency. It is as willing to supply the spurious as ever. The fact, however, is, I repeat, that the English public are not so willing to accept it. Compare the trade with the Netherlands for the first nine months of this year with the trade of the first nine months of 1905 and 1904. The so-called butter trade of this year showed a diminution of 9,000 cwt. as contrasted with the same period of 1905, and of 48,000 cwt. as contrasted with 1904.

Will the Minister Heed the Lesson?

What lends an added moment, a deepened lesson, to these figures is that the general consumption of butter has not decreased. Even Russia itself—despite her per-absorptions in revolutionary designs and bureaucratic retaliations—has in the last two years considerably increased her supply of butter to England. The fact is, as I have said, that a gathering antagonism to the faker and the faked has been aroused in the British conscience and in the British stomach. My Lord Carrington has told us that we must not expect the Butter Bill this season. Should not, however, these facts I have given induce him to demand of his colleagues that the Bill should have a first place in the programme of next session? Already the English people are bidding the faked-butter and the faked-butterist begone. Its warning has been couched in very much the same language as Juliet's father addressed to his anemic daughter:

"Out you, green-sickness carrier!
Out you baggage—you tallow-face!"

At Suffolk assizes on Friday, Freak Cook, farmer, Fressingfield, and James Rumsby, labourer, were charged with stealing fifty lambs. The prisoners, it was stated, went in the middle of a July night to a neighbouring farm and changed fifty inferior lambs for as many superior animals. At the Quarter Sessions recently, as we reported at the time, the jury could not agree on the case. The prisoners were, however, now convicted and sentenced, Cook to twelve, and Rumsby to nine, months' imprisonment.

THE FARMERS' CLUB.

Farm Implements in their Relation to Labour—Progress of Agricultural Machinery—"Finality has not been Reached"—Agricultural Societies and Machinery.

"Farm Implements in their Relation to Labour—A Retrospect," was the title of the paper set down to be read by Mr. John McLaren, of Leeds, at to-day's meeting of the Farmers' Club, at Whitehall, S.W. We have been favoured with an advanced proof, and from this we see that Mr. McLaren deals very extensively with his subject, but as he remarks, it is one so extensive and important that it cannot adequately be dealt with in a single paper.

In the early part of the nineteenth century, says Mr. McLaren, the machinery of the farm was of the most primitive character. With the exception of scythes and reaping-hooks, which were manufactured in Sheffield, the principal mechanical appliances of the farm were of local make—crude, heavy, and ill adapted to their work. But when the Royal Agricultural Society, in 1839, commenced to hold its annual exhibitions in different parts of the country, the educating effect soon became apparent. The offer of prizes, with the assurance of a good market, for improved farm machinery acted as a sufficient inducement to the more intelligent and enterprising of the agricultural mechanists to improve their productions and adapt them to the requirements of their various customers.

The result was satisfactory to all parties. The manufacturers reaped substantial financial benefit, while the farmers were able to replace their antiquated and inefficient appliances with others lighter in draught, better adapted to their various requirements, and capable of doing more and better work with a smaller expenditure of power. In a very few years many small firms, who had hitherto enjoyed a merely local reputation, blossomed out into huge manufacturers, whose capital, guided by skill and the experience of a rapidly-growing business, was employed in producing wholesale the implements which were formerly made only in small quantities.

The tide of improvement, therefore began to flow nearly seventy years ago, and if our review had extended backwards three-quarters of a century, instead of only fifty years, the contrast between then and now would have been much more marked. I may be wrong, but in my opinion the twenty years from 1840 to 1860 witnessed a greater and more important development of agricultural engineering than any fifty years of progress either before or since.

The duo-decade in question witnessed the advent of the corn drill and the horse hoe, as well as the light and graceful ploughs of Howard, Ransome, and Hornsby, which replaced the clumsy, old-fashioned horse ploughs of our grandfathers. They saw the reaping and mowing machine displace the sickle and the scythe. They welcomed the introduction, for all practical purposes, of the portable engine and thrashing machine, which wrought a revolution in the thrashing and dressing of grain. In this period also road traction engines and steam ploughs had already given promise of their stupendous potentialities. In numerous other directions, such as food-preparing, root-pulping, and corn-crushing, the small seed was planted which has now grown into such an immense tree.

Mr. McLaren then divides his papers into eight leading sections, and deals with each pretty fully. The sections in their order are:—Prime movers, horse implements for cultivation, seed sowing, clearing the ground and keeping down weeds, harvesting and storing the crop, threshing and preparing the crop for market, dairy machinery, and food-preparing machinery. The labour question is also dealt with at greater length than the other sections. Summing up, Mr. McLaren says:

With regard to *prime movers*, I think these are sufficiently developed for all practical purposes.

Finality has not been reached,

but steam, gas, and oil engines may be considered commercially efficient. With regard to implements for cultivation, there is more scope for mechanical power than in any other department of agriculture. This being one of the heaviest operations of the farm, some means should be devised of substituting machinery for the animal power, which is practically universal at present.

Harvesting and storing the crop.—Here is another series of operations requiring considerable power, in which the aid of steam machinery should be made available, especially on land with a comparatively level surface. Cutting and carting hay and corn, hauling on and spreading manure, lifting potatoes, thinning and lifting, topping and tailing turnips offer a wide and varied field for the employment of machinery. I believe there are some of those unsolved problems which would give way to solution if sufficient inducement were offered, but as this paper is primarily retrospective

it is scarcely within its scope to anticipate what may happen in the future.

I may be allowed to mention one recent development which may have far-reaching consequences on the future of farm machinery. I refer to the numerous electric power schemes which have been floated in many localities. I believe it will soon be possible for farmers within these districts to purchase the electric current at their very gates. This could be utilised for every purpose for which steam, gas, oil, water, or other engines are at present employed. It is the cheapest form in which power in small units can be obtained, ready at a moment's notice, and capable of doing either heavy or light work. One of the greatest advantages is that no more power is paid for than is actually used. It can be employed for lighting dwelling-houses or farm buildings with much greater safety than either gas, oil lamps, or candles.

It is not likely that the rates of wages paid to farm labourers will be reduced. It is almost certain they will continue to rise. More attention must be paid to the question of improved cottages, water supply, and sanitation. In some districts these are all that can be desired. In others they are very bad. It is a curious fact that some of the worst houses are on the estates of owners who pose as progressives and social reformers. It is outrageous that on any estate human beings should have to herd together in hovels scarcely fit for cattle, in which decency and morality are out of the question. If the growth of the labour bill, taxation, and the cost of improved housing should increase the figure, further recourse must be had to the use of machinery.

If the leading agricultural societies will resume

The old System of Giving Medals

or prizes for any class of machinery which may be necessary for the development of agriculture, I believe they will not have long to wait for what is required. Just as the awards of prizes fifty years ago improved the plough, thrashing machine, and portable engine, so it would now stimulate engineers to produce and perfect any machinery the farmer wants.

Most of the large agricultural engineering firms of to-day secured their trade by having their specialities tried and recognised by the award of prizes from the Royal and other leading agricultural societies. As a rule each firm specialises in its own particular line, and the prizes obtained not only enabled it to secure a big home trade, but also to capture foreign business, which it finds very profitable. Engineers now find it pays them better to manufacture on a large scale their own particular lines than to launch out in new branches involving costly experiment to perfect new machines, unless they can have the encouragement and assistance of the agricultural societies to bring them before the purchasing public.

In the days of progress, to which I referred at the beginning of my paper, invention was stimulated by the knowledge that a Royal prize would infallibly lead to good business. It is many years since the Society did anything practical in the way of inducing engineers to tackle difficult agricultural engineering problems. It is not enough to give them the opportunity of exhibiting their products at the shows, and trusting to the public to judge for themselves.

The agricultural public is very conservative, and experience shows that it takes a long time to create a market for even a meritorious invention. But if it has passed through a series of trials at the hands of the judges at some of the big national shows, and received the distinction of an award, the position is entirely changed. The consequence of the present system is that most of the big agricultural engineering firms prefer to devote their attention to manufacturing and selling their stereotyped designs instead of spending money in producing new inventions which the public might be very slow to adopt.

The Agricultural Depression

of the last twenty years or so, has not only disorganised the farming industry, but also its handmaid, the agricultural engineering trade. In spite of the best available machinery, it is very hard for the farmer to make a decent living, and it would be impossible for the agricultural engineer, without his foreign trade, to keep his business going at all. We are thus in the curious position of having an industry, with the command of a first-class mechanical equipment, as far as it goes; but this equipment is very little wanted because it will not pay to grow corn.

And so most of our large engineering and implement firms producing these very machines are sending them to foreign countries with virgin soil

and more suitable climate, to enable the foreign producer to grow and handle his crops so cheaply that he can destroy the trade of our agriculturists at home.

It seems impossible to form any proper conclusion on this important subject without touching on some of the collateral issues which affect it. The whole question of agricultural labour and machinery is intimately bound up with the political and fiscal conditions which prevail in this country. It is, however, obviously impossible at this time and place to enter upon the larger subject, but we need not shut our eyes to its effects.

In the country our farmers are struggling to make a living on the land, tilled for generations by their ancestors. In all our large towns the authorities are faced with the problem of poverty and want of employment. In the country the land is being laid down to grass because it will not pay to grow corn, and in the towns philanthropists and local authorities are struggling with the difficulty of the unemployed.

Owing to some extraordinary mental obliquity very few people seem to see any connection between the two. But there is, and a very little consideration should bring conviction to the duller comprehension. The laying down of grass in the country displaces a large amount of labour, which flies at once to the large towns and cities, there to enter upon the grim struggle of existence.

Young and capable countrymen, used to horses, can always find employment in the large railway yards and factories, where such labour is in demand, but they displace the older and less vigorous townsmen whose places they fill, and who are either thrown into the ranks of the unemployed, or have to take refuge in the workhouse.

I assert without hesitation, that if corn growing could be made to pay, these men would be kept at home cultivating the land which is their natural and legitimate work, and the serious problem of unemployment would be within sight of solution.

NOTES AND NEWS OF AGRICULTURAL SOCIETIES.

Cheshire Chamber.

The Cheshire Chamber of Agriculture on Monday passed a resolution stating that the responsibility of farmers who send milk to places by train should end at the station at which the consignee received it. It was contended by one or two farmers that the responsibility for the quality of the article should cease with its delivery to the railway company, but the meeting thought that would be going too far, and that the milk producer would be sufficiently protected if his warranty ended at the delivery station. With a view of increasing interest in its work, the chamber resolved to try the experiment of meeting now and then in other parts of the county. It was agreed that next year the January meeting—the annual meeting—shall be at Crewe, the February meeting at Chester, the March meeting at Knutsford, the April meeting at Crewe, the May meeting at Chester, the October meeting at Crewe, and the November meeting at Macclesfield.

Denbigh and Flint.

The report presented at the annual meeting of the Denbighshire and Flintshire Agricultural Society stated that the finance committee were not this year in a position to congratulate the members upon the society's increased financial prosperity. On the year's working there was a debit balance of £20, which was principally owing to the fact that prizes worth £150 were given over and above those at the previous show at Ruthin in 1902. During the year there was a net increase of thirty-five members. The assets of the society amounted to £1,368, over £1,000 of which is invested in the Bank of England. Mr. Godfrey Fitzhugh, Plaspower, Wrexham, is president of the society for the ensuing year, and Mr. Philip Ashworth, Horsley Hall, near Wrexham, vice-president.

East Suffolk Chamber.

Prior to the meeting of the council of the East Suffolk Chamber of Agriculture on Tuesday, the Sugar Beet Committee of the Chamber met, when it was reported that the returns from the growers were not yet quite complete. Specimens from many of the plots had already been sent for analysis, and it was expected that the sugar content would prove very satisfactory. Some of the plots, however—those on light land—were reported as producing a very small crop. A sub-committee was appointed to prepare a report at the meeting of the council it was decided to try to obtain an adjournment of the 11th session, as "Sugar-beet growing" at the Central Chamber, until a definite report was ready. The council decided to oppose the Public Statute Law Bill, on the ground that such legislation was un-

necessary, and also decided to concur, with the Leicester Chamber of Agriculture in a representation to the Secretary of State for War, "That they felt very aggrieved at the change in the Army contracts for meat from home-fod to home-killed, and to urge the necessity of rescinding this alteration." A letter was received from Mr. R. L. Everett, M.P., on the subject of the Land Tenure Bill, and it was decided to call a general meeting to discuss the subject on November 20.

Herefordshire Chamber.

The Council of the Herefordshire Chamber of Agriculture at their last meeting discussed four questions received from the Central Chamber. They did not consider the culture of sugar beet interested Herefordshire, but agreed to support the proposition that the liability of consignors of milk should cease when it reaches the consignee's hands. No decision was come to upon the Workmen's Compensation Bill, the question being indefinite. The question of local taxation was referred to the sub-committee to arrange. The meeting decided to support the Leicestershire Chamber in regard to a deputation to the Secretary of War to express objection to the change in army contracts for meat from home-fod to home-killed.

Holderness.

At the meeting of the Holderness Agricultural Club held on Tuesday, it was unanimously resolved that the club seek to effect the abolition of the statute hirings held before November 23, as verbal engagements entered into before that date whereby servants are hired from Martinmas to Martinmas cannot be legally enforced. The sugar beet question was also discussed, but no resolution passed. A satisfactory feature of the meeting was the election of twenty new members, this bringing the strength of the club up to about 300.

Norfolk Chamber.

The Norfolk Chamber of Agriculture voiced the feelings of Norfolk farmers generally when they passed a resolution that the Public Slaughter House Bill, now before the House of Lords, would, if it became law, have a very prejudicial effect on the producers of meat in this country, and that the Bill should be withdrawn. One speaker drew attention to the fact that twenty years ago there were 1,500 private slaughter-houses in London; to-day there were only 315. Thirty years ago it was not unusual thing to see from 7,000 to 10,000 beasts at market every Monday, and on Thursday a large number. To-day, if they had 1,000 they could not sell them, and the other Thursday there was not a single hoof standing on the market. This was, he said, the effect of the abolition of private slaughter-houses: what would be the effect when they were totally abolished throughout the country it was not difficult to foresee.

Nottinghamshire.

A meeting of the council of the Notts Agricultural Society was held on Wednesday, at the offices in Nottingham. There was a large attendance, Earl Mauvers presiding. Mr. Stockdale, the local secretary at Retford, attended, and various points were discussed relating to next year's show in that town. A sub-committee was appointed to confer with the Retford committee as to local classes and the site. A sub-committee was also appointed to revise the prize schedule and to select judges. It is intended to issue the schedule earlier than has been customary.

Woodbridge.

A falling off in subscriptions and entries, due greatly to the death of many staunch supporters, was reported at the annual meeting of the Woodbridge Horse Show Society on Wednesday, but nevertheless there was an improved balance (£19) on the right side, after deducting the working expenses of the year. Mr. Clark, of Sudbourne Hall, was elected president, subject to his acceptance of the position. Mr. A. J. Smith was re-elected vice-president, Mr. S. Toller auditor, and Mr. H. H. Green treasurer. An honorarium of £12 was voted to the secretary (Mr. G. Shipman), who was unanimously re-elected.

The estate of the late Captain H. D. Trelawny, a member of the old Cornish family of Trelawny, was sold at Chester on October 27. The estate, known as the Shotwick Park estate, near Chester, comprised a mansion and building lots. The property was divided into forty-eight lots, and the first to be offered was the mansion house and grounds, and several farms and cottages, the whole comprising 1,328 acres, and having a rent roll of £2,426. The opening bid was £50,000, and the final £70,000, at which figure the lot was knocked down to Mr. Maples on behalf of Mr. William Vernon, Birkdale, Southport. The same gentlemen had before extensive purchases, and the total amount realised by the estate was £294,500.

DAIRY.

Nantwich Dairy Show.

The Cheshire Dairy Farmers' Association's two day show at Nantwich was held on Wednesday and Thursday, and as was the case at Chester, the exhibit, both in quality and quantity, maintained the association's high reputation, and were highly creditable to the exhibitors. Some thousands of cheese were spread over the floor space of the extensive Market Hall, and collectively they weighed about 60 tons. The preference of the county for producing cheese of coloured make was again very manifest, the coloured classes, though not more attractive to the eye than the display made by white cheeses, predominating. One class of coloured, in which the competition of farmers resident in the United Kingdom was invited, contained seventy-seven dairies. Multiplied by four, which was the limit placed upon the number of each dairy exhibited, there were no fewer than 308 cheeses, and the class by itself made up a show of quite respectable dimensions. The white class, in which again the United Kingdom was the limit of the association's sphere of competition, was the next largest class in the show, the entries mustering forty-eight. In commenting on the quality, the judges remarked that the task of judging was this year one of great difficulty, while in some classes there were exhibited cheeses which did not attain the standard which experts insist upon should be the standard by which good cheese should be judged—the colouring of some of the cheese shown was a defect noted—the

general quality was excellent, and that of the prize winning dairies as nearly perfect as possible. In the coloured and uncoloured classes the first prize winning dairies were in each class only a little superior to dairies which were chosen as the winners of the second prizes. All of them were of first-class flavour and texture. The open class for coloured cheese included, said the judge, the finest dairies he had ever judged. In colour, in make, and in texture and flavour they were considered to have attained a standard of quality beyond which it is impossible for the dairymaid's skill to go. In some of the classes cheese made to imitate Cheddar cheese were met with. The judges, however, did not approve the innovation. The association's gold medal went again to a superb dairy shown by Mr. John Dutton, of Swanley. Mr. Dutton easily holds the record at the Nantwich show as the winner for the greatest number of times (eight) of the association's championship. Last year he was barred as a competitor, having won the gold medal the previous year. The second prize was won by Mr. S. Charlesworth, of Leighton Hall, who for some time past has been a consistent maker of first-class cheese, and the third was won by Mr. S. Dutton, of Burleydam, a son of the gold medalist. Between these three dairies there was very little difference in quality, and the judges for a considerable time deliberated before finally placing them. The championship dairy was of very handsome make, and the colour, texture, and flavour of the cheese were perfect. The second and third prize winning dairies almost attained the same high standard.

The butter also made a good display, but was naturally eclipsed by the cheese.

At the cheese fair on Thursday there was a pitch of 140 tons, of which 60 tons was show

cheese. Factors were present from all parts of the country, and there was a clearance of both show and fair cheese. The championship dairy in the show made 120s. per cwt., and other prize winning dairies were sold at prices up to 100s. Dairies without prizes fetched from 75s. to 80s. per cwt. In the fair there was a good tone, and finest dairies made from 74s. to 79s., medium lots from 70s. to 73s., and lower grades from 60s. to 65s. per cwt.

A Self-Releasing Hook, Churn Trolley and Carrier.

The main object aimed at by Mr. Pearce in his "Acme self-releasing hook," churn trolley and carrier has been to place on the market, at a reasonable figure, a trolley, simple in construction, that will effectually deal with the easy transport of churns about railway stations, dairies, &c., and thus do away with the wear and tear to floors of same, which inevitably results from the present system of rolling.

The hooks being entirely free from springs, it is impossible for them to get out of order under ordinary use. To pick up or set down a churn in the desired position requires one action only—i.e., tilting the trolley.

They should prove invaluable to railway companies, dairymen, &c., who are constantly dealing with a large number of churns, as by their use a very great amount of manual labour will be saved.

The initial outlay will be soon counteracted by the saving of the aforesaid wear and tear to floors.

The carrier is for getting churns up and down steep inclines where the trolley cannot be used, and is so made that the churn always maintains an upright position.

The utility of the trolley and carrier is not only confined to milk churns. It can also be adapted for use in factories and warehouses where heavy cans have to be dealt with.

Mid Cheshire Farmers and the Price of Milk.

At a large meeting of the Mid-Cheshire Farmers' Association, held at Knutsford on Monday, it was decided to form a minimum price association to control the milk trade. It was declared that wholesale prices are ruinous, leaving little margin of profit. The scheme was outlined by the chairman providing for a deposit by every member with forfeiture in the event of a price below the minimum being accepted. A district committee was appointed, and it was resolved to approach the Stockport, Macclesfield, and other milk associations in Cheshire, and request their co-operation.

Western Counties Cheddar Cheese School.

The fourth draft of cheese, weighing about 33 cwt., made during July last at the above-named school, carried out at Glendale Farm, near Wedmore, has just been sold to Messrs. Hill Bros., of Everceech, at 76s. per cwt. of 112 lb. 4,077 gallons of milk made 3,963 lb. of green cheese, which when sold at fourteen weeks old, weighed 3,761 lb., showing a shrinkage of about 5 per cent.

The following particulars relating to the manufacture of the cheese will be of interest to cheese-makers:—Temperature of milk when renneted, 84 deg.; acidity of milk when renneted, 19; temperature of first and second scalds, 88 deg. and 93 deg.; acidity of whey when vatted, .88; average time when cheese was put in press, 3.30 p.m.

Agriculture in Natal.

According to the report of the Secretary to the Minister of Agriculture, Natal, for the year ended June 30, 1906, great agricultural progress was made during the year, notwithstanding the fact that farming operations were considerably interfered with by the native disturbance. The average value of produce obtained from each acre of cultivated land in 1905 was £4 8s. 11d. The land under cultivation by Europeans in the same year was 372,000 acres, 22,000 acres being under irrigation.

There are approximately 4,000 farmers in the colony; 317 engines and turbines are in use, 135 hydraulic rams, 2,064 maize mills, 886 maize planters, 467 baling machines, and 102 windmills are worked.

The value of the dairy industry to Natal during 1905 was approximately £148,052, represented by: Butter produced, £48,783; cheese produced, £2,469; eggs sold, £24,576; milk sold, £72,227. Particulars are given relating to the production and exportation of arrowroot, barley, beans, and peas, fodder and forage. Kathir corn and maize, oats, onions, plants, and bulbs, potatoes, and fresh vegetables.

The "Mark Lane Express" and the Kentish Farmers.

"Business is Business."

A resolution passed by the Tunbridge Wells Farmers' Club has been received by our editor, and it is amusing to note that the exact copy of the terms used by the Maidstone Farmers' Club, to which we referred last week, indicate that both have originated from one source.

We should have been better pleased and more completely enlightened if more extended information had been communicated. We are still as much in the dark as we were previously, and therefore have very little to add to our former remarks.

The "MARK LANE EXPRESS" aims at being recognised (as our title expresses) as to "The Farmers' Business Paper." Business is business, and our desire is always to adhere to this principle, without fear or favour. If at any time we are mistaken in our estimate of the course of business, whether affecting hops or any other of the interests we write about, we are open to correction and amendment. But in this case we have no ground to act upon.

The condemnations conveyed in these resolutions are only general and vague, nothing specific is even hinted at, and unless our readers will be good enough to define their objections more clearly, it is impossible for us to deal with them. It must be remembered by our critics that we have at our disposal a much more extensive area of information than can possibly be within the ken of our friends in the country, even when they are assembled in their local club rooms. This information is utilised for their benefit, and the details thus ascertained are carefully weighed before they are put into print.

We have, therefore, confidence in the correctness of the news we publish, and in the present instance we may certainly appeal to the evidence provided by the well-known course of events during the current season for confirmation of our position.

We may emphasize the statement that our warmest sympathies are on the side of British agriculture. We earnestly desire to promote its prosperity, believing that the true interests of the nation are intimately bound up therewith. But our duty as public reporters of passing events compels us to be impartial, and sometimes to bring forward facts that may not always be satisfactory to our readers.

We know that this has recently been the case with respect to the hop-growing industry, the results of this season having been so very disappointing to all concerned. We cannot, however, admit that our statements have been either "inaccurate or misleading," as declared in the resolutions we have received.

We must, therefore, our critics to give us, if they can, some indication as to the points they complain of, and we venture to anticipate that when they attempt to formulate their complaints they will find they have been too hasty in their conclusions, and will in the end acquit us of any intention to mislead or of any inaccuracy.

Borough Trading.

Growers, Factors, and Merchants.

A somewhat lively discussion has recently taken place in the columns of one of our provincial contemporaries concerning the alleged "bearing" policy of the merchants, to which is attributed the unsatisfactory range of prices of hops prevailing since the commencement of the season. The editor declared, in an article on "The Hop Industry," that "it seemed fairly obvious that 'bearing' influences were being exercised on the market, and for this the merchants must be held chiefly, if not solely responsible. It was a case of a struggle between individuals acting more or less independently, and a very powerful class of traders who have a common plan of action."

Messrs. Cattley, Aridley and Co. promptly took up the cudgels on behalf of the merchants, and at once repudiated the charge, claiming that their interest in the welfare of hop-growing is quite as important as that of the growers themselves. They also point out that the position, though hard upon growers, is perfectly natural and anticipated by all who have studied the facts of the market conditions, which are attributable to the abnormal

English crop of last year, foreign importations, and cold storage. It is denied that merchants have organised any tactics for lowering prices.

The Editor, in his reply, fully admits that there is some sound sense in Messrs. Cattley's explanation, and this is supported by another article which acknowledges that merchants are interested equally with the growers in the prosperity of the industry, but accuses them of endeavouring to assist brewers in the pursuit of cheapness, giving as a reason for this policy that merchants hold many shares in the various brewing companies.

To this Messrs. Cattley's respond, saying that "if the critics were workers in the trade they would better understand the difficulties of selling the home growths with consumers practically independent for some time to come, and foreign hops offering at considerably under English." They also publish a copy of their circular of October 15 in which they recommend their customers to operate without delay. The editor, however, stands to his guns, in saying that merchants are the real offenders in the matter, and that their interest in the industry is purely personal.

There is something to be said on both sides of this discussion by the impartial outsider. In the first place, it is evident that growers are more or less at the mercy of buyers. The reason is not far to seek. They are isolated, and have no internal cohesion. After the months have passed, during which they have been engaged in the cultivation of their crop, spending their money freely in order to achieve success, frequently fighting with serious natural hindrances such as climate and blight, the crop is gathered and brought to market.

Without any organisation for counsel or mutual protection, they come to the Borough, with only limited information as to the surrounding circumstances of the year, and they find themselves with little or no voice in determining the real value of their produce. When they find that the trade is going against them, it is not surprising that there should be whispers of conspiracy, which they are helpless to combat.

Of course, they look to their factors for advice, and I believe that in most cases such advice is honestly tendered, although it is usually accepted.

Factors are their selling agents, and should watch over their clients, and protect them from all the possible machinations of buyers, who are naturally open to take advantage of the weakness of growers, and obtain their hops at the lowest possible prices. It is for such service that factors claim their commissions, which are in the main honestly earned. But agents are useless unless they can find buyers, and this is the anxious business that follows, and I can testify from personal observation to the diligence exercised in this direction.

Thus we arrive at the merchant's office, and we are bound to recognise the importance of his position in the business, when we know that as a rule he is the distributor of our produce to the consumer. He takes the responsibility of advising (by means of his travellers) the brewers to buy. In other words, the merchant bought on his own account entirely, and stored the hops on the chance of disposing of them. This is not now so general as formerly, the unfortunate facility with which samples can be borrowed enabling many merchants to send out their offers without incurring any risk, the sale being made subject to the lot being unsold, and thus an element has been introduced into the trade which is, in the opinion of many, very detrimental to the interests of the growers.

The trend of circumstances has therefore brought the consumers into the position of complete control, and until growers are consolidated into a compact body for their own defence they will be practically powerless. Doubtless brewers are influenced to some extent by the advice of the merchants with whom they have traded for many years, and therefore merchants may be held in a degree answerable for the prevalence of dullness or activity in the market. But the altered position of the breweries, their concentration into immense amalgamations, and the consequent changes in their methods of business, are the main causes of the influence they are now able to exercise over our interests.

For these reasons I cannot admit that the Borough is to blame when trade is bad and prices are drooping. It is, of course, open to question whether two sections of traders are necessary, but the long established system still remains, and seems likely to continue. Each man or firm must live by profit, so we can well accept their assurance that the interests of all are closely associated with a strong market, and good prices.

We are all apt to blame others for our own misfortunes, and it is very easy for dissatisfied growers to unload their troubles on to the backs of the Borough traders. Fairly considered, the Borough does its duty to the growers. I am sure it would do better if it were possible, but facts are stubborn things and hard to masticate, therefore

we must be content to accept them when we cannot get rid of them.

Home Notes.

From the commencement of the period of activity reported last week to the close of last month a healthy business continued, the market was apparently gaining in strength, and there were bright hopes that higher prices would be realised. Some of the large growths were sold, and the total of business has been fairly extensive.

Unfortunately, this week finds our traders rather inclined to be despondent. They are certainly very sensitive, and are quickly elated or depressed by any change in the commercial atmosphere. At present they shake their heads and smother the dullness of the general business, and some of them are talking of lower offers being accepted and of an increasing pressure by growers to sell.

Last week I said that the improvement in values from the lowest point was not less than 20s., and that there was a prospect of still better prices.

To-day I have made many inquiries, and am sorry to find that I cannot hear of any further advance. Prices are evidently standing still, and can only with some difficulty be supported. This is disappointing, but I fear it is true. I ventured to warn holders that they must be on their guard against such a possibility, and I repeat the warning, as it is under such conditions as the present that a slump is initiated, which if not checked will lead to disastrous results.

It seems as if brewers were determined not to go beyond a certain point, and as if they had fixed upon the neighbourhood of £6 as their limit. It is therefore necessary for growers, at this critical moment, to be very watchful of the trend of events, and not to allow any favourable opportunity to pass.

It is generally admitted that a more puzzling market has never been experienced. Factors hardly know how to advise, and many of them are almost sickened by the uncertain prospects. But there is yet hope that trade may revive, and if this condition should happily be brought about, the present rather gloomy clouds will speedily be dispersed. We cannot, however, lose sight of the fact that foreign hops are being offered at low prices, and that a full supply is arriving from the continent. We must also take into account the expectation of considerable consignments from America, and the energy with which the agents of American shippers are pushing their business.

All these points should be carefully considered by our planters who are still holding. As aforesaid, they must be very observant, lest their previous dissatisfaction should become more acute.

Foreign Notes.

America.—Recent letters confirm previous estimates of the crop, which is now reckoned at 321,000 bales. According to these figures there will be not less than 125,000 bales, or about 200,000 cwt., available for shipment to England. It is stated that the quality of the New York and California crops are good, but that Oregon and Washington qualities are mixed, the latter pickings being somewhat damaged by mould and red spider. My correspondents say—

"Our markets are absolutely lifeless, and no one seems confident of any improvement in the near future. Brewers, with their heavy carry over stocks, are exceedingly indifferent to offers, and dealers, almost without exception, have contracts with growers sufficient to meet all of their early deliveries. Values are constantly sagging without inducing anyone to take hold of stock." A later cable message says—"Our market is very quiet indeed; in fact, there is nothing doing, consumers preferring to wait. We believe the market will go lower."

France.—Business in hops at Dijon, the centre of the trade in the South, is very active. At the opening of the last fair there were many orders, which amounted freely at 80 to 90 francs, but before the market closed the value advanced from 5 to 10 francs. The crop has not come up to expectation, and is being rapidly cleared off.

Hop Manures at the Brewers'.

Messrs. Joseph Fison and Co., of Ipswich, who are drawing attention to the remarks appearing on page 470, in lines 4 and 5, where the statement is made that in Classes 4 and 5 Mr. Ernest Manning took both first prizes. Then the statement follows:—"The samples were grown with the art of hop guano prepared by the Anglo-Continental Guano Works." This statement is quite incorrect, continue Messrs. Fison and Co., as you will see from the Brewers' Exhibition Catalogue and a list of awards. It is clearly stated that Mr. Manning's Exhibit No. 2, Class IV, is grown with Rabbit tick and artificial manure, the name mentioned. In Class V, No. 34, the first sample, the manure is gypsum and Fison's special. We much regret that we had certainly did not do justice to Messrs. Fison and Co. in this matter."

Northern Notes.

JUST the sort of weather we might expect has set in as October closes. A wonderfully open season has favoured all farming operations, whether for ploughing, sowing, storing mangolds, or carting work. Now the rains are falling. For full two days there was no cessation—a steady downpour, combined with a low temperature, produced a sort of “back-end” feeling unmistakable in its import.

THE highways were cleansed, and pastures soddened. Green food had grown wonderfully nearly the whole of October, and there was a better bite than in September. Grass lands look as green now as they did in early summer. No frosts to speak of—and none within the last few days—have been experienced, and herbage, therefore, retains its appetising flavour. With fine open weather the farmers were enabled to make rapid progress with their tillage, the land working much more freely than at the corresponding time last year, when on strong soils the draught was quite heavy.

THE Martinmas hiring fairs are announced in various parts of Yorkshire. Years ago it was predicted these public hirings would soon be a thing of the past. The assertion was glibly made, and probably without a thought as to what method could be substituted for these gatherings to which generation after generation of farmers and labourers had given their patronage.

MASTERS and men will be popping the question about stopping again, this week-end. The love of change seems inherent in the lads born on the soil. Once they leave the parental roof for a “place” they appear to look forward to an annual change of master, hence there are many rolling stones among them; but it is not true in their case that they gather no grist. A farm lad, well-fed and strong of limb, is able by the time he reaches manhood to have saved well over £60 if he is careful in his habits. Then after that he may rise to a foremanship, or may take in the men to “meat,” and thus lay by a nice sum of money. One has heard of lads in Yorkshire who have saved as much as £200 by the time they were forty, and men of a thrifty nature and skilled in agriculture are enabled to set up a little farm on their own account. The post of a hind in Yorkshire is greatly sought after; a popular farmer has scores of applications whenever a vacancy occurs.

THE Holderness Agricultural Club held an interesting discussion on the same topic—hirings—at their meeting on Tuesday, in Hull, and a resolution was adopted with a view to the abolition of those which are held before November 23, “as verbal engagements entered into before that date cannot be enforced.” Masters and men are perfectly well aware of the state of the law, and it is also well known that engagements made at the earlier, or what are called in East Yorkshire the “first” hirings, are very generally regarded as morally binding, and are faithfully adhered to, except in a few instances. These “first” hirings are held as a matter of convenience. Who is to abolish them? They are not held under any statutory enactment; and any local authority can issue notices that they will be held, and there is no power—certainly not on the part of clubs—to say them nay.

THE plea of the Holderness farmers is that much valuable time is wasted by the lads and youths getting away and spending a whole working day at these so-called “illegal” “statute” hirings. The plea is a somewhat selfish one; and it will be a rash act on the part of the agricultural interest in the Holderness country if any serious action is taken tending to stir up a spirit of antagonism between master and servant, by interfering with the present arrangements. Is there not a sneaking tendency to treat farm servants as bondsmen, rather than as free agents?

ONE is inclined to think that advantage is occasionally taken of rustic ignorance by a certain class of masters. The men at present have no organisation to combat any grievances they may have; masters may rest assured, however, that as labour becomes more and more an organised factor the agricultural toilers will not be left without “leaders.”

THE Cleveland Chamber of Agriculture has elected the Earl of Zetland president. The honour is a deserved one, for his lordship is an excellent landlord, and he and his tenantry live together on the best of terms. Tenant farmers meeting together at their club do not invariably feel free to talk about their affairs in the presence of their landlord; but it appears the Cleveland farmers have no such fears, and it need hardly be said that if they have any grievances—sentimental

or otherwise—Lord Zetland would lend sympathetic ear to them.

AN appeal for help made to these North Yorkshire farmers by the Huntingdon Chamber for help towards assisting distressed agriculturists in that district, whose farm crops were destroyed by the August hailstorm, created some discussion. We in Yorkshire have suffered quite as much—nay more—than our Huntingdon friends, and yet no appeal has gone forth for assistance. Mr. H. T. Allison told the Chamber that some of their friends on the moors had suffered to the extent of £1,000 and over. In the eastern parts of Yorkshire the tale of destruction was even greater. But the landlords there have come to the aid of their tenants; and without wishing to appear in any way dogmatic, one might commend their action to others.

THE chief food inspector to the Hull Corporation has urged the need of a public abattoir for that city, in a lecture delivered to members of the Hull Trades and Labour Council. There is very great force in what Mr. McPhail said about

the apathy of rural and many urban councils. Generally speaking, the powers which an authority possesses are those of the Act of 1875, and the amending Act of 1890, and he thought the time had arrived when a plain, intelligent Act should be passed containing the word “shall,” and not that incentive to inertia “may.”

THE care and provision of our food supplies ought to be a national charge, and it is a standing reproach to the nation that it is not so. The lecturer has done good service to the public by his outspoken utterances about the lurking dangers in milk, meat, and fruit, and he has aroused such a spirit of determination amongst the Labour party that at the municipal elections one of the “planks” of the platform was the question of a public abattoir.

TO-DAY I have received a record of the rainfall for October, which was 4.580 in. Rain fell on eighteen days. The shade temperature showed a variation of 38.5 deg. (69.5 highest, and lowest 31.0 deg.).

November 2, 1906.

Midland Notes.

IT is enough to mention two facts to show how much we are indebted to October. Its temperatures were generally above the average for the time of year, and the rain it brought us totalled 4.3 in. Now 4.3 in. of rain means 430 tons of water an acre, which is a liberal allowance for two ordinary months. In the circumstances it is not to be wondered at if the autumn sowing of winter wheat cultivating heavy land should have found the surface soil inclined to get waterlogged. But they seem to be few. Nothing could be more eloquent of the dryness and thirstiness of the earth than the rapidity with which ordinary soils have sucked up these perpetual downpours. Considering the quantity of rain the past month has brought it may seem strange that farm work has been so little interrupted. The explanation lies, of course, in the storms and showers coming in the night. Many times we have had soaking downpours at night and still found the land fit for plough, harrow, or drill by nine or ten o'clock next morning.

THERE is some reason to suppose that Midland farmers are again giving a little more attention to beans. The tendency was noted in this column a year ago; it is again evident to-day. True, it does not amount to much; it is only on the eastern side that the fragrant scent of beanfields is at all a common thing. But it indicates that among the many farmers who are much dissatisfied with the current wheat prices, a few are giving a trial here and there to an experimental field of the leguminous crop; and so far as one can gather, the experiment is generally found to work pretty well. Certainly, beans at 32s. or so per qr. ought to pay their way, for the crop yields well enough in Warwick and the adjoining counties.

CONSIDERING how wonderfully the roots have looked up, the farming year ought to turn out more profitable than seemed at all likely during the early autumn. Of course, there have been some heavy and exceptional expenses. One hears of roots which failed altogether, with the result that the fields had to be ploughed a second time for rape, and of the rape in turn coming to nothing and being replaced late in the season with mustard. The last should afford a useful bite of green fodder in due course, but it will be an expensive crop when everything is charged against it. The poor prices realised lately for stores are a source of very bitter complaint; it is true there has been an improvement, but calf-rearing has hardly been a profitable pursuit lately, and without further amendment in this direction sheep seem likely to become more than ever the sheet-anchor of British farming.

EVEN in present circumstances no one could call agriculture a flourishing industry; still, signs are not wanting that the extreme depression of a few years ago is lifting. The agents of large properties have not, as a rule, many farms unlet, and in one or two recent large estate sales a very notable feature has been the way in which tenants have come forward to purchase their own holdings.

MAY I express a hope that a paragraph in the MARK LANE EXPRESS last week as to the care of drains will be taken to heart? It is a subject which would have been touched upon already in these notes had space permitted. During the last few weeks I have observed so many cases of foul and half-stopped open ditches and closed drains with stops so choked up as to make it impossible for water to flow freely from them. The hands, one is told, have been too busy

on other work to attend to such matters. But there is a heavy penalty to pay for neglect. How deplorable, too, to see valuable implements lying idle in the open, exposed to the rain and damp air. In the mind's eye I see both reapers and mowers which must have depreciated not a little in value this past autumn.

THE curious thing about such instances of neglect is that the culprit is so often far from a careless man. Often he is conspicuously a hard worker, and a firm believer in the gospel of thoroughness and efficiency. Everyone must respect the man who rents two or three hundred acres, and spends his days toiling on the land like any labourer; but such things as these suggest sometimes that he might have taken a wiser course, and that the vigilant oversight and foresight of a trained brain might in the long run be of more value to the farm than the hard physical labour which takes up so much time and energy.

November 2, 1906.

Downton College Closed.

It is with regret that we learn that the College of Agriculture at Downton has been closed. The college which, although regarded as a public institution, was actually a private enterprise, resting entirely upon the responsibility of Professor Wrightson himself, was opened in May, 1880. Professor Wrightson had every reason to be satisfied with the success of the college until the close of 1899, when it received a blow in the outbreak of the Boer War. The effect of this was not only that a large number of students left the college in order to join the Imperial Yeomanry and other bodies, but it was also marked by a temporary cessation of entries. The immediate consequence was that between October, 1899, and January, 1900, the number of students went down from over forty to about seventeen. After peace was declared the numbers increased, but never regained their previous position.

An effort was made to enlist the interest of the County Councils of Wiltshire, Hampshire, Somerset, and Dorset, in order to transfer the responsibility from one man's shoulders and to firmly establish the College as a public institution. If this had been accomplished the Board of Agriculture would most probably have assisted with a liberal grant. It was, however, found impossible at the time to bring these powerful bodies or any of them into line, and thus a great opportunity was lost.

Professor Wrightson now felt that after twenty-six years of strenuous life in connection with the advancement of agricultural education, that a time had come in which his physical strength could scarcely support such a Herculean task, and he therefore came to the conclusion that as he had opened the college he would likewise close it, and enjoy what few years remained to him in greater quietude.

It must be a matter of regret to many that a college which has done so much for the education of a whole generation of land agents and agriculturists should have ceased, for the present at least, to exist.

We are informed that Mr. P. J. Parmiter has resigned his position and sold his entire interests in the firm of Messrs. P. J. Parmiter and Co., Station Works, Tisbury. The business will be carried on quite as usual at the old address, Station Works, Tisbury, Wilts, with the entire plant, stock, and staff.

Battle Protest at the Brewers.—In consequence of a protest having been lodged against the awards in Classes 7, 8, and 9 for Foreign Malt by Bury, which entries are for any other than “two-rowed,” the judges after careful examination have decided to disqualify the whole class in consequence of incorrect description.

CORRESPONDENCE.

AGRICULTURAL LAW.

Advice of a legal character is offered to Readers entirely free of charge. Particulars of cases should be addressed to the Editor, "MARK LANE EXPRESS," 3, Wellington Street, Strand, London, W.C.

Insect and Fungus Pests.

SIR,—If I appeared pessimistic in my former contribution on this topic I can assure "Sevenside" that it was my knowledge of the slowness of the powers that be to move in matters of this kind that made me so.

No, "Sevenside," we should not refrain from calling out for a good thing merely because we are not likely to get it, because it is said that constant hammering will wear away the hardest stone, and the day may come when the authorities at headquarters will realise that fruit-growers have a case that deserves to be listened to.

What annoys one is that these recommendations are made from time to time for certain things to be done in the interest of fruit-growers, and nothing more is heard of them. In fact, they are like pouring water on the proverbial duck's back. But there, let us keep on hammering and worrying, and perhaps if we die in the meantime our children will reap some benefit from the effort.

November 1, 1906. WEST COUNTRYMAN.

Forestry and the Duty of the State.

SIR,—Since my last letter to you in your issue of the 8th ult., on the revival of village industrial life in connection with forestry, I have received a remarkable corroboration of Mr. Ralph Pearson's exposition as to the duty of the State with a view to encourage the creation of scientifically cultivated forests. Mons. Ch. Broilliard, one of the greatest authorities in France on silviculture, in a letter just addressed to me, entirely supports Mr. Pearson's statement. It may be of interest to your readers to know that this great veteran expert, who has returned for permanent residence to his native village in the high plateau forest district of the Haute Saône, has long laboured by speech and pen as the most competent teacher in the science of silviculture known, being, as he is, the undisputed head of the French school.

Dr. Frankhauser, the distinguished Swiss Agonomist, in an appreciation of the high services to the Continental movement rendered by M. Ch. Broilliard, observes that "while ranking foremost in theoretical knowledge, M. Broilliard proved himself as well capable in actual practice as in the out-door service of forestry. He combines the possession of rare abilities with that of an extraordinary rich store of learning. With all his erudition, he is no armchair philosopher; his theories have been evolved, not in the study, but in the woods. Dr. Frankhauser goes on to say that it was just for this reason that Broilliard's teachings have found such universal favour among practical men, and that all his writings, besides being distinguished by clearness, precision and elegance of diction, bear such a pronounced stamp of original freshness and individuality. What he has written about the organisation and management of the Plenter-Wald and the Mittelwald forests is among the most notable of all that has ever been published on the subject. No one has advocated more successfully than he the extension of the 'periods of stock rotation' and the accumulation of valuable oaks among the 'tall timber' stocks (*oberholz bestand*) of the forests. Above all, we are indebted to him for the development of the 'thinning out' process on the French system. But very few have comprehended as fully as he has the actual physical life of a forest, the special requirements of each species of wood, and the high importance to be attributed even to the meanest among them, as being part of the whole."

I am pleased to add that M. Broilliard gives it as his opinion that, under the municipal system of Zürich, to which I referred in my previous letter, the timber system is well managed by the Swiss Municipality. True, he points out that in the case of Zürich the exploitation of the timber—the working up of the wood—takes place in close proximity to a town where it is consumed and disposed of; and he expresses himself to the effect that in France the cultivation of big timber (*grands bois*) is the most desirable plan to adopt, and that it is above all necessary to await the full development thereof. He adds that, in his country, their administration of woods and forest works excellently, it being left to the purchaser himself to clear away the wood. He also incidentally remarks that in France, in order to get rid of the commoners' (*usagers*) rights to wood, a portion of the forest is assigned to them absolutely.

But it is a question how far it would be advisable to adopt this system in England. As M. Broilliard very pertinently says, "the rights of ownership and on enjoyment of forests are so varied and sometimes so peculiar (*et parfois si bizarres*) that the transfer of matters connected with them from one language to another is often an exceedingly delicate operation."

I am glad to see, since I dealt with this municipal trading re forestry in your columns, that practical attention seems to have been given to

this matter by two London Members of Parliament, Mr. Chiozza-Money, and Mr. Pickersgill. Both recommend that, in view of the coming winter, some attempt should be made in the public interest to put to better use our woods and forests, with the result that in the future we might reasonably hope for a revival of what the French call the delicate craft of *boissellerie*—an interesting and useful industry which I have seen in operation in Belgian villages and places in the Austrian Tyrol, such as Berchtesgaden.

In proof also of the increased attention that is being given to this subject, I would hopefully point to the deputation which waited upon the Chief Secretary for Ireland, Mr. Bryce, at Dublin Castle in April last, when Lord Castletown—who has already done good service in the matter of tree-planting and the "starting of industries" connected therewith—advocated the creation in the near future of a "really sound scheme" of State afforestation.—Yours faithfully,

CHARLES HANCOCK, B.L.
Reform Club, S.W., October 26.

Irish Eggs?

SIR,—There has been a considerable movement in the poultry industry in Ireland, the departments having been very active in introducing new and improved breeds. We are told that great advance has been made in the methods of exporting eggs, and we believe it is true.

It might be a puzzle to some to know what becomes of those not fit for exportation, and we ourselves had wondered. October is admittedly a difficult season in which to get fresh eggs, as so many hens are in moult; but we did not quite expect an experience which befell us a few days ago, and in go-ahead Belfast, of all places. Reaching that city by the night mail, we were rather late for breakfast, and the only occupants of the coffee-room in a well-known hotel in the Royal Avenue; our companion ordered eggs for two.

Then we waited, occasionally pressing the bell, but got no answer; so after waiting nearly half an hour we went down to the manager's office, and asked that breakfast might be hurried up.

Shortly afterwards the waiter came in wearing a rather aggrieved expression.

We said: "You have been somewhat long, waiter?"

"Yes, sir," said he, "it takes a long while to boil eggs at this time of the year."

"A long time at this time of the year—what do you mean?"

"Why, sir, you've got to have a good many boilings before you get four good eggs at this time of the year," said he, with a rather pitying look at our ignorance, but with a candour that would probably not have been appreciated by the manager, and which certainly did not give one much confidence in attacking the four which had passed through the ordeal of boiling without exploding.

This was Belfast, and we were shortly going to spend a week or more in the poor and dirty districts of the West, and our hearts sank within us for experience in the past had taught us that if one was at all squeamish as to the cleanliness of the kitchen departments, the best way to avoid contact with undesirable matter was to largely adopt the egg diet. As a matter of fact, the eggs in the West were fresh.

The question arose in our mind. Is Belfast the recipient of Ireland's "shop 'uns," or have not the various organisations done quite as much in the improvement of poultry management and egg distribution as some would have us believe?—Yours, &c.,

November 2, 1906.

What is a Filly?

SIR,—I was interested in the case tried in Scotland which hinged on the question as to what is a filly. Your report hardly furnishes sufficient ground for me to form an opinion as to whether the sheriff was right in only allowing a portion of the costs, but in my opinion he was quite right as a matter of fact.

It seems to me that a filly must be a maiden.—Yours, &c., S. J. W.

November 2, 1906.

In reply to a communication from Mr. Luke White, M.P., on the subject of the irksome restrictions now imposed on the movement of swine in Yorkshire, Sir Thomas Elliott, Secretary to the Board of Agriculture, has written saying that in view of the large number of outbreaks of swine fever in the East and West Ridings of Yorkshire during the present year, the policy of controlling the movement of swine from markets is absolutely necessary, and must be pursued until further improvement is shown.

A Horse Accident.

SIR,—A horse fastened by a pair of traces to the off-side corner of a one-horse dray, outside the shafts (in which another horse was fastened), and therefore projecting farther into the road than the dray itself, was run into by one of my carts. Can the owner of the damaged horse claim compensation from me for the damages caused by the accident; or, was the way his horses were arranged illegal in a narrow country lane? I may add that had the dray been fitted with a pair of shafts for each horse, or had the trace horse been attached in front of the one in the shafts, which were in the centre of the dray's front, no accident would have occurred.—Yours, &c., R.

I do not know of any illegality in the way of fastening the horse that was injured which would absolve you from the liability of paying compensation. It was your duty to see that you did not run into the horse, but you are not liable if the accident were unavoidable, nor are you liable if the owner of the horse was guilty of contributory negligence, unless the contributory negligence was the proximate cause of the accident. I confess I cannot see why, on the facts stated to me, you should not be held responsible in law for the damage done.—BARRISTER-AT-LAW.

SHOW GOSSIP.

At a meeting of masters of Lincolnshire packs of hounds it was decided that £150 should be raised by the different hunts for two classes at the Royal show at Lincoln next year, these to be for farmers of over and under 300 acres respectively, for the best managed farm regularly hunted over by any Lincolnshire pack. It has been subsequently suggested that a parade of the various packs of hounds at the Royal would be an attraction.

We understand that at a general committee meeting of the Oxfordshire Agricultural Society, held on October 27, the Mayor, Corporation, and town of Banbury invited the above society to hold their annual show at Banbury in 1907, and the committee unanimously approved of the suggested day for same—viz., Tuesday and Wednesday, May 14 and 15. There is little doubt that the invitation will be most cordially accepted, and the dates of the show confirmed by the annual meeting of the society on November 24.

The West of England Fat Stock Society's Show at Plymouth on December 12 and 13 should prove a good one, for quite a number of offers of special prizes have been received, and these, together with the society's usual prizes, should make up a good schedule and attract a large number of entries. It has been decided that unless there are four entries in fat bullock class, the third prize money be withheld. The prizes in the sheep classes in the past have been £4 and £2, but this year the prizes will be £3, £2, and £1, and if there are not four entries in any one class the third prize will be withheld. The chairman thought, however, that the reduction of the first prize money would keep away the best class of animals.

At a meeting of Welsh Liberal Members of Parliament, held on Tuesday, a resolution giving the Land Tenure Bill general support was passed. The resolution set forth that, whilst Welsh Liberals could not view the measure as a final solution of the question as it affects Wales, the Welsh Parliamentary party nevertheless regard it as an instalment which they were prepared to support so far as it benefited tenant farmers.

Thurs. October Fair, the principal one for cattle during the year at Thirsk was held on Tuesday in miserable weather. There was a large number of beasts offered for sale; in fact, the best show seen for some years. Trade ruled low, especially for lean cattle, but anything choice in fat beasts was not bad to sell. Calving cows were very scarce, and met a brisk trade at good prices. Geld cows were somewhat scarce, and although the trade for them was good, the prices were not exceptionally high. Prices:—Year old bullocks and heifers, £5 to £6 10s.; one and a-half year old bullocks and heifers, £6 10s. to £8; two-year old bullocks, £11 to £13 10s.; fat bullocks up to £18 10s.; fat heifers, £15 to £16 10s.; calving cows up to £21; geld cows, £9 to £12. A few yearling Irish bullocks and heifers were offered, but met only a slow trade at prices ranging from £5 to £9 each.

POULTRY.

The Need of Ventilation in Poultry Houses.

Buildings for poultry should be constructed with reference to ventilation. Fresh air is "living food." This invisible fluid that surrounds us constantly, so that we are hardly conscious of its presence, differs in its life-preserving qualities in no respect from the beef and mutton that we place upon our table. It is, indeed, light and invisible, but its absorption is ceaselessly going on, and hence throughout the twenty-four hours the amount consumed becomes prodigious, and any deficiency or defect in the supply is very soon felt by the whole constitution.

The subject is one of the greatest importance to poultry breeders; indeed, an error in this will seriously diminish, if not entirely destroy, his profits. An error also is very easily made, for economy in building poultry houses is rightly thought to be so important a matter that the temptation is to crowd their inmates as closely as possible.

In the first place, a deficient supply of air results in a depraved constitution; none of the natural processes go on well. The fowl will not lay so well nor raise so large a percentage of chickens, for the reproductive apparatus is among the first points of attack when the system is lowered. A more palpable injury, however, is that the flock becomes much more liable to contagious and epidemic diseases, such as roup and cholera.

The need of ventilating poultry houses is, in many cases, the greater, because they are so often attached to or near stables. But it must be remembered that, however clean be the surroundings, the danger from overcrowding is the same. Air that has been breathed contains matter given off from the lungs that is as destructive as that in the barnyard heap, to say nothing of the fact that the oxygen, the life-giving element in it, has been removed.

In arranging the ventilation of the poultry house, however, care is to be taken to avoid irregular draughts, especially through small openings. The instinct of fowls teaches them to roost out of draughts when it is possible.

Fowls are often kept in close quarters for some special purpose, such as fattening for the table, or to induce laying in winter. But even here it is probably the warmth in the latter case, and the quiet in the former, that make the experiment successful. No one pretends to consider these conditions natural any more than canning or cramming, and their use is temporary, and ending with the accomplishment of the purpose. In both these cases also it is by no means certain that fresh air, if warm, would impair the result.

The real test of such treatment is in the condition of breeding stock, and it will be found that these must have ample supply of air all the year or they will disappoint the breeder.

It would be impossible to do without poultry houses, for how would the poultry keeper in small villages get on without them? Farmers frequently do not require to build poultry houses for fowls, they have plenty of out-buildings, but if they would take the advice of one who has tried all ways of housing poultry, they would convert one of the out-buildings into the poultry house and use it for that purpose alone. Fowls which sleep first in one place and then in another are liable to contract disease. Be sure to give the birds plenty of ventilation.

People try to keep their birds as warm as they can, but it is certainly a mistake in kindness. Many persons have an idea that the warmer birds are kept the better they lay. Now this is altogether wrong. It is a mistake to warm the houses artificially. There are a good many oil stoves used for poultry houses, but the birds are not any better for them; they are pampered up and feel the cold much more when they come out of the houses. The best way to ensure the health and happiness of the fowls is to provide them with wooden houses, made of strong boards, without draught, nice and warm round the bottoms, but with plenty of ventilation at the tops, so that there is a free current of air passing over the birds' heads; then they do not feel the cold so much when let out.

Bedding them down with peat moss litter makes it dry and warm for the birds' feet. This system is giving much satisfaction to those who have adopted it at our suggestion. It is a saving of labour and much better for the birds.

The annual Cow Hill Fair, at Newcastle, took place on Wednesday, when the falling off noticed in recent years continued, stock of all sorts being below the average. Prices ranged from £11 to £15 10s. for three-year-olds, £10 10s. to £14 10s. for two-year-olds, and £5 10s. to £8 for yearlings. About 1,200 were shown. Draught horses made £50 to £60; harness horses, which were a drug in the market, to £40; good Hunters, £80 to £90; colts, £10 to £30; and ponies, £5 to £20.

WE MAKE GUNS

We sell to the user with only one small profit.
We sell for cash direct to the user.
We buy the finest materials to be obtained.
We pay cash for all materials.
We employ some of the finest workmen in the Gun Trade.
We use finest machinery for machine operations.

RESULT.

We sell for £25 Guns of a quality for which sportsmen have previously paid from £50 to £80.

We sell thoroughly reliable Guns.

We get the finest shooting it is possible for guns to make.

Our "Field" Hammerless Ejector Gun.—A perfect Ejector Gun of the finest quality, £25. If made with the best single trigger mechanism ever invented, £39. A perfect pair of these Guns, beautifully matched, £59. A perfect pair of Single Trigger Guns, £60.

"The Gun of the Future," as an Ejector, £15. "The Gun of the Future," without Ejector, £10. A sound and reliable gun, well made, and perfectly balanced, which will give entire satisfaction.

Pattern 8662, £6.—A sound and reliable hard shooting and hard wearing hammerless gun. Better than many sold at double the price.

Pattern 8368, £4.—A sound and reliable hard shooting and hard wearing hammer gun. Better than many sold at double the price.

Ploughing, Hedging, and Ditching Competitions in Shropshire.

The Wen and District Agricultural Association is doing much to revive a real interest on the part of the sons of the soil in the traditions of their industry, and how successful the efforts are was proved at their fifth annual ploughing, hedging, and ditching competition, held on the 26th ult. The entries were more numerous in all classes than before, and the competitors were early on the scene, men and their teams of two and three horses being on the ground by 9 a.m.

Some had an acre to plough and others half an acre, the former using a double plough and the latter a single one. For the start at 10 a.m. no fewer than twenty-two teams were drawn up, and four hours was allowed in which to do their work. Straight as a line each competitor had soon made his "cop," and then all were at it for dear life. It was a sight worth looking at to see all those sturdy fellows, with backs bent to keep the plough to the required even depth, and eye fixed on the long line of the furrow.

Not a whit less interesting was the skill shown by the men engaged in hedging and ditching. There were no fewer than thirty-two of them, each with twelve yards of hedge and ditch to do. Like their comrades at the plough, they handled their tools and dealt with their materials with theadroitness of the skilled workman. If it is said that the younger labourers are losing the skill of their forebears the Wen meeting afforded evidence that told a different tale. Both in the hedging and in the ploughing there were classes for the young fellows. Ploughing, like other things, may run in families. At any rate, there was something like it on this occasion, for the winner of the first prizes for the best plough butt in the young men's class was the son of the winner of the first prize for the best ploughed acre with three horses in the men's section. Needless to say, father and son, Mr. John Arrowsmith and Mr. H. Arrowsmith, both of Moreton Corbet, came in for a real ovation when they went up to the waggon in the open field to receive their well-earned prizes.

It took a long time for the judges to get over the hedging and ditching work—they had some tough bits to decide on in the lengths of the elder men. Laying a hedge requires practice and skill, and here the old men, although perhaps not so fast, surpassed the younger ones. Both old and young did some capital work, and one or two of the lengths were clever and artistic pieces of hedging and ditching. By the time the judges had ended their task the shades of evening had begun to close in over the field, and the prizes were distributed in the half light characteristic of a late October evening.

The Earnings of Harvesters.

An article in the Board of Trade *Labour Gazette* for last month stated that this year's corn harvest was, on the whole, gathered in less time than that of 1905 owing to the exceptionally fine weather, which enabled work to proceed with practically no interruption. Comparatively few extra men were engaged, as most of the corn stood up well, and was cut by the aid of self-binding machines. A number of day labourers were unable to get harvest engagements.

Generally speaking, harvest earnings averaged somewhat less than in 1905. From statistics furnished to the Board, it was shown that on certain farms in the eastern counties 695 men in twenty-three days earned an average of £7 8s. 6d.; in the midland counties 365 men in twenty-five days earned £5 16s. 1d.; and in the southern and south-western counties 358 men in twenty-one days earned £4 9s. 4d. This is exclusive of any food and drink provided.

The eastern counties, where the earnings were highest, comprise the great corn-growing counties of Huntingdon, Cambridge, Lincoln, Norfolk, Suffolk, and Essex, and the payments (which are usually made according to a contract for the harvest) in these counties ranged from about £6 15s. to £8, though more was earned by some men on piecework in the fen districts.

A short harvest, as in 1905 and this year, is a profitable one for the labourer, as he gets back to ordinary farm work at weekly wages sooner than in years such as 1902 and 1903, when the harvest was lengthened by unfavourable weather.

In the midland, southern, and south-western counties the systems of payment are frequently on a time-work basis, so that harvest earnings fluctuate from year to year according to the duration of the harvest, and the longer harvests of 1902 and 1903 would be more favourable to the labourer than the shorter harvests of 1905 and 1906.

The northern counties have been excluded from the statistics, as the majority of the farm servants in the north are hired by the year or half-year, and paid a regular wage, with free board and lodging during the whole of the period for which they are hired, and are given no extra money for harvest, though they are often given extra food and drink.

Fertilisers and Feeding Stuffs.

USEFUL INFORMATION FOR FARMERS WHEN BUYING.

Approximate Unit Cost of Fertilising Constituents.

It is necessary for guidance in the economical use of fertilisers, and especially in the purchase of Complete and Special Manures, that the relative unit cost of the principal fertilising constituents should be studied: the subjoined table affords information on the subject. By multiplying the guaranteed minimum percentages of a fertiliser by the unit costs given in the table, the buyer will get a good idea of the commercial value of any chemical manure offered to him. The unit values are subject to variations from time to time, and in this respect we shall endeavour to keep the table up to date, besides which, buyers living in remote districts may have to pay a little more for heavier cost of delivery. If credit is required, this will also add to the cost.

	Peruvian Guano.			Nitrate of Soda.	Sulphate of Ammonia.	Bone Meal.	Super-phosphate.	Basic Slag.	Bone Compounds.	Special Manures.	Kainit.	Sulphate of Potash.	Muriate of Potash.
	Raw or Equivalised.	Phosphatic.	Dissolved (soluble).										
Ammonia, organic as in Guano and Bones ...	s. d. 15 0	s. d. 12 6	s. d. 15 0	s. d. —	s. d. 10 6	s. d. 12 6	s. d. —	s. d. —	s. d. 15 0	s. d. 15 0	s. d. —	s. d. —	s. d. —

„ calculated from Nitrogen in Nitrate of Soda ...	—	—	—	12 0	—	—	—	—	—	—	—	—	—
Phosphate soluble in water ...	2 0	—	2 0	—	—	—	1/10-2/	—	2 0	2 0	—	—	—
„ assimilable ...	1 3	1 2	1 3	—	—	1 2	—	—	1 3	1 3	—	—	—
„ insoluble ...	—	—	—	—	—	—	—	1 3	—	—	—	—	—
Potash (pure) ...	4 0	4 0	4 0	—	—	—	—	—	—	4 0	3 10	4 0	3 10

N.B.—The above table is based on the commercial cost of the fertilising constituents. Agricultural value is not always synonymous with the commercial cost, and every farmer must exercise his judgment, while considering the cost, which fertiliser may be expected to give the most profitable return on his soil and for his crops. This is the cheapest manure for him.

Approximate Unit Cost of the Nutritive Constituents in Feeding Cakes and Meals.

June, 1906.

Cakes and other Feeding Stuffs.—In order to be able to form a correct opinion of their value, it is necessary to know the relative cost of the different nutritive constituents. The following note, by an eminent authority, supplies this information. By reference to it, a farmer can calculate out the approximate commercial value of a cake or meal, and then use his judgment as to which is most suitable for his special requirements.

Note.—Most authorities in England are agreed that the value of each per cent. of unit of albuminoids and of oil is at least 2½ times that of 1 per cent. of unit carbohydrates. If, therefore, the percentages of albuminoids and oil in a feeding stuff be respectively multiplied by 2½ and added to the percentage of carbohydrates, the total feeding units contained in the article are obtained. The cost of the feeding stuff divided by this total of feeding units gives the price per unit. Example: A cotton cake contained

	s. d.	s. d.
Albuminoids ...	2 8	3 0
Oil or fat ...	2 8	3 0
Carbohydrates ...	1 1	2
Per cent.		
Albuminoids ...	22.1	× 2½ = 55.2
Oil ...	5.2	× 2½ = 13.0
Carbohydrates ...	33.2	× 1 = 33.2
Total feeding units ...	101.4	

The price of the cake being £5 7s. 6d., the cost per feeding unit was just about 1s.

Note to Regular Subscribers.

We may remind our readers that we are prepared to analyse free of cost for our regular subscribers, who are farmers, and not in trade as vendors of fertilisers or feeding stuffs, samples of minimum lots of 2 tons of either article, in cases where there is solid reason to suspect an attempt to defraud. The analyses are published, under a *nom de plume*, in the paper.

We are also willing to publish replies in these columns to inquiries relating to the quality and use of fertilisers and feeding stuffs.

Drill Compared with Broadcast Applications of Fertilisers.

It is generally assumed that it is more advantageous to apply mineral fertilisers with the drill, as the fertilising material is thereby placed more directly at the disposal of the young plant. To test the relative efficiency of the two methods, some careful experiments have been made by Professor Stebut on the Government estate at Krotkov. He finds that when applied by the drill, the fertilisers are placed where they are exhausted in the early stages of the growth of the plant, which is stimulated into vigorous development, causing it to make increased demands upon the soil during later periods of growth. Drill fertilising does not increase the supply of plant food in the soil or provide fully for the requirements of the plant, but may result in actual soil exhaustion. Therefore in such cases the whole soil must be well supplied with plant food, the fertiliser applied in the drill acting mainly as a stimulus, enabling the plant to utilise in the later stage of growth the plant food more generally diffused in the soil.

Fertilisers applied broadcast act somewhat in the same way as when applied in the drill, but continue to furnish plant food through a longer period, depending upon the character of the root growth of the plant. If the season is dry there is a danger that some of the fertiliser, when applied broadcast, may not be utilised by the plant, as in the absence of rain the material is not rendered soluble so that it can circulate through the soil.

Board of Agriculture

(Intelligence Division).

The Intelligence Division of the Board of Agriculture have just issued the annual report of proceedings during 1905 under the different departments with which the Board is especially associated.

In looking through it one is impressed with the wide range of activity of the Board's operations and also with the idea that farmers in general do not avail themselves of the guidance and assistance of the advisory department of the Board as much as they might.

Among numerous other subjects the Board again refer to the serious question of faulty seeds.

Purchasers of seeds are reminded that seeds for use on farms and market gardens should always be bought subject to a guarantee of purity, genuineness, and high germinating power.

Purity means that the seeds should consist of the required variety without admixture of other seeds or of sand, dirt, chaff, &c. Impurity is mainly caused by carelessness in separating weed seeds from the bulk, and from want of care in cleaning and screening. It is one of the most important considerations in purchasing seeds, as impure seed is the cause not merely of a diminished yield, but is responsible for the spread of weeds. Here is an example. Two samples of home-grown clover seeds were examined and were found to contain, in one case only 53 per cent., and in the other 45 per cent. of the true seed. In some samples tested, one which contained less than 1 per cent. of impurity had about 3,000 weed seeds to the pound, while another sample containing 2½ per cent. impurities had 27,600 weed seeds. The number of weed seeds sown to the acre in such cases must be enormous, and, having an equal chance with the crops among which they grow, must be the cause of considerable loss. The presence of 1 per cent. of dock seed in a mixture of grass and clover seed for ordinary leys means ten or more dock plants per square yard all over the field where it is sown. Farmers cannot be too strongly urged to have their seeds tested. Members of agricultural societies can have this done for a small fee, and tests are also made quite cheaply by the Aynsme seed-

testing station, as well as by some of the agricultural colleges and stations.

Best Variety of Wheat.

This is a problem which is no doubt occupying the minds of many farmers at the present time, and, as affording guidance on the subject, the Yorkshire Council of Agricultural Education have issued a report on a comparison of thirteen varieties, tested at Garforth during the past season. The trials have now been carried on for eight years, and therefore the conclusions, which are based on the average yields obtained over this period, may be considered as reliable, under similar conditions.

The previous crop in the field where the trials were carried out was "seeds," following a good crop of oats. The land was ploughed in excellent condition early in October, and the varieties were all drilled on October 26, 1905, at the rate of three bushels per acre. New seed was sown, and as usual was pickled (1lb. sulphate of copper to 1 gallon of water to 4 bushels of seed) before sowing. The summary of the crop is:—

1. Of the red wheats the most satisfactory for yield and quality have been Standard Red, Square-head Master, Red Standup, Browick Grey Chaff, and Red King.

2. There is little to choose between White Queen and White Standup. The latter on account of its shorter and stiffer straw commends itself for land in good condition.

3. It would appear that no great advantage is to be gained from frequent changes of seed.

4. It may be noted that the Canadian wheat, "Duluth," which has now been grown for three years in succession, has improved in yield each year without any appreciable loss of quality. Still bigger yields, however, must be obtained before this variety can be grown with profit: besides, in dull, cold seasons it might not do so well.

Few farmers accumulate as much manure as they desire. Instead of spreading their manure over too much land, it will be better to use it with fertiliser, on less area. In this manner it will not be many years before every acre will double its average yields, and the profits will be larger because the expenses will be correspondingly reduced.

Cattle Food Trade Association.

This newly formed association held a meeting on Thursday, October 25, at the new Corn Exchange Restaurant, Mark Lane, when the chairman explained the suggested rules and regulations, and proposed their adoption, which was unanimously agreed to. The chief objects of the association are stated to be the introduction of more uniformity in the practices of the trade, to agree upon equitable and convenient forms of contract, and generally to promote the interests of the trade.

We hope the action of the association will tend to suppress the sale of inferior materials, and it will then have the good wishes of all interested in the prosperity of the trade.

Import of Fertiliser Material during September.

Basic slag, 33 per cent (ex works, Mid-lands) " " " "	1	13	0

Commercial fertilisers are mainly valuable because they furnish to the crops the elements ammonia, phosphate, potash, which serve as nourishment to the plant. These elements are not to be regarded simply as stimulants; they are plant foods.

In spite of political disturbances, the Russian farmers manage to cultivate their best crops. Our Consul reports that the crop this year promises to be larger than usual.

Consumption of Nitrate of Soda in Europe.

	1903.	1904.	1905.	1906.

THE

"BIBBY" CAKE

IN THE FORM OF
"CAKETTES."

"Send me two tons of they nobs same as Mr. Brown is a using," was the colloquial way in which a new customer gave us an order the other day through our Market Representative.

This buyer had often thought he would like to try the "Bibby" Cake, but he belonged to the old school of farmers who are not easily led along untrodden paths.

He had, the previous week, been paying a visit to his neighbour, Mr. Brown, who had often spoken favourably to him of our Cake, and on looking over his Stock and noting the extreme handiness of the "Cakettes" for Summer Feeding, he at last resolved to give us a trial order, and did so in the words just quoted.

It was doubtless the good condition of Mr. Brown's Cattle and the manifest handiness of the "Cakettes" which had finally broken down this buyer's conservatism; and now we have received a trial order we shall take good care to retain his business. Our method is a simple one: We put such value into all our Cakes and Meals as will insure the best results obtainable.

THIS IS THE TRUE SECRET OF OUR SUCCESS.

It is, perhaps, hardly needful to point out in this place that the "Bibby" Cake is the most popular brand of Cake that has yet been made, and no other explanation but the one above mentioned will explain this fact.

It is not well, therefore, for buyers to be put off with a Cake which is offered as something "just as good"; it is much better to say to the Cake merchant: "I must have 'Bibby,' and will not take a substitute."

The "Bibby" Cake has steadily won its way to

THE PREMIER POSITION IN THE PUBLIC FAVOUR,

and of all the Cakes on the market is admittedly the best. In the form of "Cakettes" it is also the handiest; there is this further to be said about it:—the more carefully it is tested against other competing Cakes, the more certainly and with increasing emphasis will be the reply to those who offer a substitute:—"I MUST HAVE 'BIBBY,' PLEASE: THAT IS THE CAKE I WANT, AND I WILL TAKE NO OTHER."

NOVEMBER CATTLE AND SHEEP MANAGEMENT.

After All Saints' Day, experienced farmers have always been accustomed to take note of the Calendar, however abnormal in mildness the weather or abundant grass may still be in pastures. The night temperature may suddenly change and prove disastrous without previous warning, and the milk yields of exposed cows be seriously affected thereby, while weakly animals would be liable to contract colds, chills, and other ailments difficult afterwards to get rid of. Late autumn grass is never found possessed of much nutritive property, the reason cow-owners having contracts to fulfil give the animals supplementary food in the shape of cabbages or cotton cake is to prevent yield-diminishment; while those who convert their milk to butter or cheese find it expedient to adopt the same measures.

The custom of strewing cabbages or green maize on pastures at the present period has been much recommended in the past, but it is far wiser to house milk-yielding cows at night and give them what green fodder or auxiliary food is allowed in their stalls, and turning them out to

roam the grass-fields in the daytime. Some cow owners neglect to do this to save themselves inconvenience or extra trouble, others because they are short of litter. But in regard to the latter difficulty a little earth laid on the hard flooring of stalls makes a sufficiently comfortable lair for the animals.

Grazing bullocks should at once be put into their winter quarters when November comes if they have not been housed or yarded previously. At least this rule should be observed in regard to those getting advanced in beef-making. If in the richest pastures of alluvial districts there is still an abundance of good grass, the least advanced animals should be told off to consume it, or what is more usually done, sheep are bought to consume it. The more advanced grazing beasts are fed on cabbage or yellow turnips in conjunction with hay and oilcake and meals, or whatever auxiliary feeding stuffs may be deemed cheapest according to nutritive value. The rule of most farmers in regard to root supply for winter cattle grazing is to commence with yellow turnips, giving swedes in the dead of winter and mangels to finish with towards spring.

As to November sheep management, it must of course very much depend on the kinds of arable crops and their abundance which are ready for utilisation. In a great many cases breadths of mustard are being fed off. This has been found healthy fodder for any kinds of sheep, although not so nutritious as rape or kale. Mustard crops are quickly raised in about six weeks after seeding. Thus the latter may be proceeded with in August, after it is too late to sow turnip seed, and the green produce comes very acceptable generally in October, and is usually continued in November until a severe night frost withers the plants and deprives them of leafage. In other cases a considerable portion of the flock are put on common turnips. The greatest possible caution is, however, needful not to give in-lamb ewes too many turnips at this period. Nine-tenths of abortions and still-births of lambs are probably due to ewes having been allowed to have their fill of turnips at this season or to other injudicious feeding. Even when no full feeds of turnips

are given, if the animals partake of too much emaculate, sloppy grass, this devoid of hay or other dry food as an alternative, would naturally chill the internal system as badly as partaking of too many turnips. A run on a dry, healthy grass field with racks kept full of hay is best for in-lamb ewes in November, but they might be folded at night behind the other turnip-fed sheep, where they could get a few shells or, if there were none, a few turnips given sparingly would not be likely to prove harmful.

Agricultural Imports.

The following account shows the quantities of certain kinds of agricultural produce imported into the United Kingdom in the week which ended October 27, 1906. The quantities in the corresponding week of last year are given in parentheses;—

ANIMALS (living).—Oxen, bulls, cows, and calves (14,614), 6,841; sheep and lambs (2,550), 2,391; horses (272), 280.

FRESH MEAT (cwt.).—Beef (86,425), 88,655; mutton (70,817), 59,856; pork (10,881), 12,456.

SALTED OR PRESERVED MEAT (cwt.).—Bacon (95,518), 102,257; beef (2,149), 2,478; hams (21,729), 23,114; pork (3,913), 3,926; meat, salted or fresh (13,822), 11,782; meat, preserved (12,320), 8,556.

DAIRY PRODUCE (cwt.).—Butter (65,409), 68,330; margarine (39,996), 21,271; cheese, (88,975), 73,424; milk, fresh (23), 0; milk, cream (117), 103; milk, condensed (19,172), 17,127; milk preserved (71), 178.

EGGS (Great hundred ls.).—(389,403), 427,297; poultry (value) (3,935), 3,963; game (value) (2,902), 2,843; rabbits, dead (not tinned) (cwt.) (15,845), 24,905; lard (cwt.) (43,173), 25,963.

CORN, GRAIN, MEAL AND FLOUR (cwt.).—Wheat (1,288,000), 1,405,300; wheat meal and flour (82,040), 215,900; barley (86,000), 789,800; oats, (321,100), 216,700; peas (47,000), 35,310; beans (10,200), 8,190; maize or Indian corn (718,000), 956,600.

FRUITS, RAW (cwt.).—Apples (160,500), 151,817; grapes (60,906), 70,510; pears (94,261), 14,330; plums (557), 8,064.

HAY (tons).—(2,639), 3,379; straw (tons) (1,914), 1,060; moss litter (tons) (1,211), 2,170; hops, (cwt.) (4,440), 6,236; locust beans (cwt.) (14,120), 21,657.

VEGETABLES (RAW).—Onions (cwt.) (210,135), 194,726; potatoes (cwt.) (2,418), 19,693; tomatoes (cwt.) (8,780), 9,100.

Earl Carrington. It is stated, will be at the Cattle Show, and will be the guest of Mr. Adams Fellows (his predecessor as President of the Board of Agriculture at Haddington, near Norwich).

Notes of the Week.

The partial destruction of the historic abbey at Selby is a matter of keen regret to the farmers of the neighbourhood.

It was founded by William the Conqueror in 1068, and was one of the finest examples of Norman architecture in the country.

It formed a prominent landmark in the surrounding flat, wide, agricultural district, famous for fat soil from the time the Benedictine monks cultivated the land.

Twenty years ago there was less than half a fowl per acre in England; now, taking Britain as a whole, there is nearly one fowl per acre, says *World's Work*.

It can't be said that the country is overcrowded with fowls. The "smart set" among the hens need not limit artificially the number of their individual families.

The Government of New Zealand is offering a reward of £500 to the man who discovers a new deposit of phosphate of lime in the colony.

Much of the cultivated land is very deficient in this ingredient. The average crop of turnips at the Government experimental farm on un-manured soil for a period of nine years was only 3 tons 8 cwt. per acre.

An application of a small quantity of phosphate of lime brought the crop up to 26 tons.

And the crop was increased to forty-three tons per acre by a dressing of soluble phosphate.

So no wonder the farmers are anxious to have a cheap source of phosphate instead of paying for the imported article.

There are 118 works (*officinas*) producing nitrate of soda in Chili.

"The use of the term 'barn gallon' in a contract renders the seller liable to a penalty," considers the Board of Agriculture.

The total number of samples of butter, cheese, milk, &c., examined under the Food and Drugs Act in 1904 was 84,678, of which 8.5 per cent. were found to be adulterated.

Last year the number was still greater, though the final figures are not yet published.

The Board of Agriculture distributed in the course of last year 1,647,000 leaflets. We hope their various contents have been duly digested.

By the way, the Board have a good agricultural library at their offices in Whitehall Place, and would like farmers to make more use of it.

Under the Fertilisers and Feeding Stuffs Act 952 samples of fertilisers and 682 samples of feeding stuffs were analysed last year.

The county of Wilts sent the greatest number, 153 samples; while the neighbouring county of Somerset sent only fifteen samples.

The important county of Lancashire had only one sample test, while little Monmouthshire had fifty-nine.

These differences are curious. It cannot be assumed that the progressive Lancashire farmers are apathetic about the quality of the fertilisers and feeding stuffs supplied to them.

Probably the explanation lies in the fact that they have a good local agricultural society, and find it more convenient to apply to the analyst of the society.

Our legislators have again assembled, and it is hoped that they will be able to spare some time from the discussion of the suffragettes and plural voting to attend to agricultural matters.

The heavy rains of the past week have seriously impeded autumn work in the fields.

Otherwise the downpour has been very welcome in many localities, which have been suffering from the long summer drought.

The consumption of potash salts in France amounted last year to 41,000 tons. Ten years ago it was 16,000 tons.

Egypt is now importing large quantities of fertilisers, manufactured chiefly in Belgium. English makers ought to have this trade.

SOCIETIES.

Bath and West and Southern Counties.

A council meeting was held at Bristol on Tuesday last.

STOCK PRIZES.

Mr. Silfiant brought up the committee's report dealing with the prizes and regulations proposed for the Newport meeting. The report recommended that classes be added for Welsh Mountain ponies not exceeding 12.2 hands; that the present classes for Black Welsh cattle be increased from three to five, so as to permit of the old and young bulls and heifers being shown in separate classes; and that two classes be added for Welsh Mountain sheep.

DAIRYING.

Mr. G. Gibbons, in the absence of the chairman of the Dairy Committee, moved the adoption of the committee's report, which recommended that a class be added for three Cheddar cheeses, not over 56 lb. each, made in 1906; that the wording of the present class for Cheddar cheeses, made by the students in the society's cheese schools, be altered so as to admit of students in any county council cheese school and in the Western Counties Cheese School competing; and that the class for loaf or other Truckle cheeses be for old instead of new cheese.

ELECTION TO COUNCIL.

Mr. E. W. Farwell, of Laura Place, Bath, was elected to an extraordinary vacancy in the central division of the council, caused by the death of Mr. F. G. Farwell.

HORSE BREEDING.

A communication was read from the President of the Board of Agriculture and Fisheries, calling attention to the following resolution of the House of Lords:—"That in view of the importance of the horse-breeding industry to the community in general, and of the necessity for an adequate and efficient supply of horses for military and other purposes, it is, in the opinion of the House, desirable that steps should be taken to improve the breeding of horses by giving effect to the recommendations of the Royal Commission on Horse Breeding in their tenth report, especially to those having reference to the improvement of the quality of

brood mares"; and expressing a hope that the society would nominate representatives to attend a conference upon the subject, with a view to affording information and advice upon the subject before a scheme is drawn up for submission to the treasury.

On the motion of Colonel the Hon. C. Byng, seconded by the Rev. F. F. Buckingham, it was resolved that Major C. D. Sherston be appointed to represent the society at the Conference.

1907 MEETING.

Mr. C. D. Phillips, as chairman of the Newport Local Committee, stated that the local arrangements in connection with the society's meeting at Newport (Mon.), were progressing most satisfactorily, and that the committee would be in a position to contribute many special prizes specially suitable to the district and which would materially add to the attractions of the show.

Lincolnshire.

The report of the council for the year ended September 30 presented at the annual meeting of the Lincolnshire Agricultural Society stated that the Gainsborough Show was successfully carried through, and, considering that there were six other important exhibitions during the week the entries were considered favourable. Except for the first evening, however, the attendances were very disappointing, and the financial result shows a loss of £244 10s. 8d. The timber was purchased for £1,072 10s., and sold for £635 6s. 10d., showing a loss thereby of £437 3s. 2d., and straw, which was generously given last year, was an extravagant item, costing £43. The society now consists of sixty-nine life members, and 723 annual members. Since last year fifty-seven members had been struck off, with two life members, three vice-presidents, and twenty-one new members added.

The report added:—"The financial position of the society, as shown by the balance-sheet, implies that great care must be taken in future to have a prize list more in accordance with the smaller attendances which are to be expected. There are now so many other attractions and cheap fares offered by the railways to draw visitors elsewhere."

The council had decided to withhold their 1907 show in consequence of the Royal Show being held

THE FARMERS' DIARY.

TUESDAY, NOVEMBER 6.—Agricultural Fairs at Tregony, Preston, Thurlis, and Kingston—Preston Great Horse Sale—Meeting of the Central Chamber of Agriculture, Adelphi, 11 a.m.

WEDNESDAY, NOVEMBER 7.—Stillstead Agricultural Show—Cattle Fairs at Swaffham, Blunbury, Keighley, and Rochdale—Horse Fairs at Hereford and Rochdale—Clark Lane Cattle and Chrysanthemum Show—Raynham's Sale at Basingstoke—Crewes, Special Horse Sale—Alford Bull Fair—Leighton Buzzard Special Horse Sale.

THURSDAY, NOVEMBER 8.—Diss Agricultural Fair—Horse and Cattle Fairs at Pocklington, Hertford, Leeds, and Romney—Sheep Fairs at Romney and Digglewade—Cattle Fairs at Sydney and Leominster—Romsey Annual Great Fair—Wimborne Autumn Horse Sale—Doverfield, Special Horse Sale.

FRIDAY, NOVEMBER 9.—Cattle Fairs at Loughborough, Bingham, and Keighley—Chippenden Special Horse Sale—Lord Mayors Day. Farmers should avoid London markets if possible, business being very difficult.

SATURDAY, NOVEMBER 10.—Horse Fairs at Ashby, Leeds, Appleby, and Carlisle—Cattle Fairs at Darlington, Leeds, Carlisle, and Appleby—Sheep Fairs at Hungerford and Appleby—Ireland's Special Sale of the Cattle Entries close for the Horsham Fat Stock Show.

MONDAY, NOVEMBER 12.—Stamford Great Fair—Chemsford, Woburn, and Redruth Cattle Fairs—Bakewell Horse and Cattle Fair—Warwick Horse and Pig Fair—Agricultural Fairs at Lee, Ross, Rugby, Thirsk, and Carmel—Many "Martinmas" fairs held on this day (for the 11th)—Entries close for Edebridge Fat Stock Show.

TUESDAY, NOVEMBER 13.—Cattle Fairs and Sales at Epping, Lostwithiel, Kingston, Rugby, Ashburton, and Doverford. Feorith and Downham—Great Agricultural Fairs at Lynn, Hay, and Denbigh—Salisbury Horse Sale—Entries to be sent in for the Ipswich Fat Stock Show—Entries close for Ashford Cattle Show.

at Lincoln, and to do what they were able in drawing up a good prize list in regard to the interests of members of the society as well as to benefit farmers and breeders of Lincolnshire. The council therefore drew up a list of special prizes to be competed for by Lincolnshire exhibitors, amounting to £124, also a list for exhibitors of stock beyond what is entered in the open classes at the R.A.S.E. Show, amounting, with the Servants' and Labourers' Classes, to £306, for exhibition on one day only.

The report was adopted, and in connection with the Royal Show it was decided that all animals may be entered in the R.A.S.E. classes also, but in the event of the winning a money prize in those classes they will not be allowed to compete in the Lincolnshire Society's section.

Sir John Thorold was unanimously elected chairman for the ensuing year, and in thanking the members, said he was glad to accept the chairmanship of the Lincolnshire Society in the year that the Royal Show was coming into their own country.

OBITUARY.

Mr. Dan Albone.

It is with regret we have to record the death of Mr. Dan Albone—the inventor of the Ivel Agricultural Motor. He went to his works at Biggleswade on Monday apparently in his usual health, and while speaking over the telephone suddenly fell, and died in an hour. Mr. Albone was one of the first to bring out a lady's safety bicycle in the days of the "ordinary," and in the early days of the "safety" he was one of the most successful runners in the country, winning a great number of prizes and cups. Of late years his attention has been devoted to the Ivel agricultural motor for ploughing and other agricultural work, and with what success is public history.

We feel sure that his death will come as a very severe shock to the many acquaintances he had. He was at the time of his death in the prime of life, being only forty-six years of age.

Mr. Thomas Keeble.

The death was announced on Tuesday of Mr. Thomas Keeble, of Bentley Hall, one of the best-known Suffolk agriculturists. Mr. Keeble, who was in his seventy-fourth year, was a successful breeder of Shire horses, his stock being known all over the country and winning a great number of prizes. He was equally successful with Black-faced Suffolk sheep, and kept his renowned flock until August, when it was dispersed under the hammer. For a period long prior to the Large Black pig coming into prominence in Suffolk Mr. Keeble had a special breed of Large Blacks of his own, which were always admired and greatly sought after, and they were admitted into the class with Large Blacks as a recognised distinctive breed.

HORSES.

Notes and Jottings.

"He doth nothing but talk of his horse."
—"Merchant of Venice."

WHY will they do it, these men of light and leading? If a man writes a novel and wishes to show his hero's prowess as a horseman, he straightway makes the horse do things that no horse could do under any circumstances, whilst as for the rider—well, his performances can only be described as miraculous. I have read of a lady being swept off her horse in mid stream and regaining her saddle! This, of course, is physically impossible. But bad as it is when the author takes the horse seriously, it is still worse when he treats him humorously. Mr. S. R. Crockett, for example, seems to see a great deal of humour in a lame van horse taking a fancy to sitting down on his haunches like a dog. I cannot see where the fun comes in myself, and a man who knows anything of horses knows that it is a very unusual thing for them to do.

WHEN a horse resorts to sitting down like a dog, he is either very badly over marked or he has a very bad "pain in his temper" indeed.

SHIRE GELDING, MADRESFIELD GOOD HOPE.

Sire Madresfield Thumper; dam Madresfield Edith Lass; bred by Earl Beauchamp, Madresfield Court, Malvern, who won with it a First Prize in the Class for Geldings four years old, at the Shire Horse Society's Show this year.

In my long experience with horses, I only know of two instances of horses "sitting down," and I only saw one of them. This was a carting mare which a relative purchased, and which was, I think, the very worst-tempered brute I ever ran up against. Two mares were bought at Northallerton Fair, both good ones, but the mare in question was as good-looking a specimen of the Shire mare as one could clap an eye on. This was in the late sixties or early seventies, when horses were cheap, and the two young mares—they were four and five years old—came home for under £50 the two. They were sadly too cheap—at least, one of them was.

THIS was Blossom, who was first yoked in the horse-wheel of the threshing-machine. I went to see her tried, and I never saw a better puller "hung by the neck." She would start the machine—a heavy one—unaided. But there was an ominous scowl every now and again, and a hind leg lashed out occasionally, and I must say I did not like the symptoms. She next went to plough, and the ploughman, an exceptionally fine hand with a horse, told me that she went well enough, but that he did not like the way she scowled at each end of the field. The next day the fun began. The mare never jibbed; she kept pulling right enough, but she kicked and kicked hard the whole of the morning, getting worse instead of better. Haytime kept her from going to plough or to work of any kind for a few days, for she was not one to put in the mowing machine, and during those few days she showed strong symptoms of being a stable savage. Indeed she would kick sometimes at the man who was taking her corn to her.

NOW my relative was a good horseman, full of expedients, and he was determined not to be beaten. He liked the mare, knew she was worth a lot more money than she had cost if she could be got to work, and make her work quietly he would. Amongst his possessions was a diabolical kind of bit with which one could almost break a horse's jaw. This bit was made really with string and a halter shank, and was put in her mouth as well as her ordinary bit, and the master undertook the management of it to see "fairplay." Blossom had not gone once round the field when she let drive, and immediately the gag-bit was sharply handled. She shook her head at the pain, was no doubt a little astonished at the cause and effect, and she went a few times round the field quietly. Let no man think he has beaten a wicked horse because the first punishment he gives him makes him pause in his career. Blossom went quietly, but there was an angry gleam in her eye and an ominous whisk of her tail. Then all at once back went her ears, and she kicked in vicious fashion. The punishment was again vigorously applied, and for a time she was quiet. But within a quarter of an hour she was at it again, and the moment the bit was used she sat down on her

haunches and screamed with rage. I never heard a horse give utterance to such a noise. A whip vigorously applied made her get up, and she was loosed from the plough and lunged with the chains dangling about her legs. She kicked no little, but the bit was applied and the whip when she sat down, which she did two or three times, and then she went to the plough again and worked quietly for an hour.

IN the afternoon we put her in the cart to lead hay, tying her well down with cart ropes, and still keeping the severe bit in her mouth. "She can't kick herself over the shafts now," said her owner, "so let her kick." She worked quietly enough for a short time, but was evidently "thinking it out." Then as she was standing in the stackyard with a load of hay partly delivered, she gave one kick and made a bolt of it. I ran to get to her head, unthinkingly, but the "let her go" of her owner brought me to my senses, and I saw the danger. She jumped a sunk fence fully 3 ft. 6 in. high, landed all right, and galloped round the field kicking all the time, and, of course, spilling the hay. She stopped, the hay was loaded up again, and she was taken back to the field.

EVERYONE'S back was up by this time—so was the mare's. When she went back to the field she made another bolt of it. Luckily the men let her go. Between the two meadows from which we were leading hay was a very strong, cleanly cut thorn fence. For some time it was a favourite place for youngsters to lark over as they were coming home from hunting, but it had grown

too big and too strong for larking, and it was a formidable jump for a good hunter. Straight at it went Blossom and cleared it handsomely, and the marks made by the cart wheels were easily discernible for many a year. Fortunately in her mad fury she galloped into a haycock, and thus upset her. Not a stitch of the harness was broken, nor was the cart broken; so we put her into the cart again, and said "Kick." And she did kick; the sound of her kicking against the cart was like file-firing. And at night when she was taken out of the cart her back was three times the size, and the now oak fore-beam to the cart was broken.

IT was our last adventure with her, and we sold her to a neighbour who had a large Whinstone quarry. Her vagaries were well known; indeed, her hock, which never went down, was a proof of them, but she was a good puller, and he said he had a man that he thought could manage her, and there would be two fools together anyhow, in which he was quite right. And the man did manage her. He was rough with her always; she had a hard day's work every day, and did not get quite so well kept as she had been with us, and when she "played up," which she did occasionally, he hammered her well with a short whip-stick he always carried. She worked for some time leading stones, but what came of her in the end I do not remember. Of course, she was drugged when we bought her.

THE only case I ever heard of a horse sitting down from sheer distress was on the day when Lord Middleton's hounds had that terrible wold run of some forty miles, when one or two horses were killed, and when tired horses were squandered all over the country. A friend told me that as he was scrambling home on his tired horse he came across another sportsman who called at a village inn for some gruel for his horse. And as he spoke the horse quietly sat down like a dog. His owner got him home that night, and he came round all right. These are the only two horses I ever knew to sit down like a dog, and I cannot see the humour of the situation in either case. I have, of course, heard of one or two other cases, but nothing circumstantial about them, and I should doubt their authenticity.

I AM very much interested in the letters referring to Fanny Drape and Duell's Star in the issue of October 22. Mr. Law, whom I have had the pleasure of meeting once or twice when I have been hunting in Cumberland, if I mistake not, and to whom I am writing privately, has set me right about the pedigree. He says the mare was ridden at Manchester by her owner, Mr. Casson. Of this I know nothing, but my authority for stating that Mr. George Mulcaster rode the mare at Manchester was that gentleman himself. As I understood him, he made a bet of a bottle of champagne that Fanny Drape jumped a certain height. I think it was a 6 ft. wall, and he rode her over it, and, of course, won his bet. It may have been that the bet was decided when the public were not in the yard or when the show was over; but Mr. Mulcaster told me that he rode the mare at Manchester under the circumstances I have related.

NOW for the pedigree of the mare. Mr. Law and "Burghslder" have put me right as to her not being by a Cleveland horse, and her sire a British Yeoman has one of the best horses that ever covered half-bred mares in Cumberland. The latter gentleman says that her dam was by (alser, a horse of whom I know nothing. I am, however, confident that there is the authority of a Cleveland Bay stallion card for the statement that there is Cleveland Bay blood close at the top of Fanny Drape's pedigree. When I read Mr. Law's letter I thought it might be the sire of the dam, but "Burghslder" puts that out of court at once. I have the card somewhere, but I have some hundred of cards, and it is scarcely worth while looking through them, as the mare never bred anything.

DUELL'S Star was a contemporary of Fanny Drape, though I cannot remember whether they met at Micklebrough, when the late Mr. E. Mulcaster rode the latter mare there in 1808 or 1809. It would be interesting to know if the Cleveland breeding of Fanny Drape was in any way similar to Star's breeding. It is by no means unlikely, but it is questionable whether it can be traced at this distance of time. By the way, has not "Another Looker-On" made a slip of the pen when he says he drove Star in harness sixty years ago. Supposing she was three years old when he drove her, this would have made her thirty-seven or thirty-eight when she was shown at the Cleveland show at Guelborough and the first three prizes in the Jumping Class were divided between her and other two. Any information about these matters will be thankfully received. THE LOCKERS.

Sales at Crewe.

Messrs. Frank Lloyd and Sons' eleventh annual autumn sales at their Repository, Crewe, on October 24, 25, and 26, proved most successful; 1,000 horses of all classes were offered, and with a large attendance of buyers some good prices were realised. On the first day the catalogue comprised 250 high-class hunters, the majority having been cub-hunted up to date, and were ready for immediate work. Mr. C. B. Roberts (Burley) and Mr. Rollaston (Leamington) officiated as judges, and awarded the champion cup for best Hunter to Messrs. S. and J. McMorran, for their chestnut gelding, which was sold for 200 guineas to Captain Swettenham; r, Mr. W. Blockley's bay gelding, 100 guineas; vhc, Mr. Young's gelding, 115 guineas; he, Mr. J. M. Washington's gelding, 76 guineas; c, Mr. T. Green's gelding, 76 guineas. Messrs. S. and J. McMorran's gelding made 76 guineas, Mr. W. Brown's 96 guineas, Mr. J. C. Carpenter's 86 guineas, Mr. H. Massey's 116 guineas and 106 guineas, Mr. J. Young's 115 guineas, Mr. W. Blockley's 100 guineas, and Mr. J. D'Arey Hartley's mare 96 guineas, whilst other good prices were obtained.

On the second day 350 high-class ride and drive horses, match pairs, brougham horses, pedigree Hackneys, show cobs and ponies were brought under the hammer. Mr. Pusey (Watford) and Mr. G. Ledson (Bromborough), the judges, awarded the prizes as follows:—Best harness horse, Mr. J. Kershaw's brown gelding sold for 72 guineas; r, Mr. J. Lucas's mare, 70 guineas; vhc, Mr. W. Thornthwaite's gelding, 50 guineas; he, Mr. P. Jones's mare, 45 guineas; c, Mr. J. Beckett's gelding, 41 guineas. Best cob, 14 hands and under 15 hands, 1, Mr. D. Richards' cob, 57 guineas; r, Mr. E. Bradshaw's gelding, 31 guineas; c, Mr. J. Beckett's gelding, 34 guineas. Best pony under 14 hands, Mr. J. A. Graham's gelding, 241 guineas; r, the Gwalior Stud's gelding, 321 guineas; vhc, Mr. W. T. Coombe's mare, 27 guineas; he, Mr. Capey's mare, 36 guineas; c, the Gwalior Stud's mare, 30 guineas.

The last day's sale consisted of 400 heavy horses, the chief feature of which were the pedigree Shires. Amongst the entries were many animals of great merit, possessing size, substance, and quality. The heavy town mares and geldings were also a grand lot. The judging was entrusted to Mr. J. B. Hill, Smethwick Hall; Mr. A. C. Sparkes, Altrincham; Mr. W. Allen, Market Drayton; and Mr. T. J. Dutton, Chester, who made their awards as follows:—For the best mare or gelding fit for town work, silver cup, value 10 guineas, Mr. R. Davies, 81 guineas; r, Mr. M. Smith's gelding, 75 guineas; v.h.c., Mr. A. Allan's gelding, 68 guineas; h.e., Mr. F. Beeston's gelding, 58 guineas; c, Mr. R. Davis's gelding, 58 guineas. Best gelding or filly, foaled 1903, 1904, or 1905, non-pedigree, 1, Mr. J. B. Hill's gelding, 43 guineas; r, Mr. A. Wright's mare, 38 guineas; v.h.c., Mr. A. Cooper's filly, 33 guineas; h.e., Mr. J. Eley's mare, 35 guineas; c, Sir P. Walker's gelding, 203 guineas. For the best Shire mare, foaled in or prior to 1902, realising 75 guineas or over, a silver cup, value 5 guineas, was awarded to Mr. S. S. Raingill's Grange Good Friday; and a silver cup, value 5 guineas, for the best Shire foal realising 50 guineas and over, went to Mr. Kenneth H. Wright's filly foal by Lookinge Forest King, which was sold for 88 guineas.

Colic Drench for Horses.

SIR,—Can you tell me what the bottle contains which veterinary surgeons give to horses suffering from colic?—W. C.

Answer: Almost every veterinary surgeon has his own special formula for colic drench, and thus the contents of the bottle varies according to the ideas of the prescriber, and, to some extent at least, according to what he conceives to be the requirements of the case. If you want a formula for a colic drink to keep by you for use in emergencies, the following will be suitable:—Tincture of opium, 1 ounce; oil of turpentine, 2 ounces; linseed oil, to 1 pint. Give this as it is, followed by a little warm gruel. Walk the horse about to prevent his rolling, rub the belly with a wisp, and, if necessary, repeat the drench in two hours, but not more than two doses should be given. Understand that it is not claimed that this recipe is better than any other; it may not even be the most suitable under all circumstances, but it is inexpensive. Easily procured, will keep good for any length of time if properly corked and sealed, and often cuts short an attack in its initial stage. Colic is, however, a preventable disease, and we would rather furnish you with advice concerning this than recipes for its cure. M.R.C.V.S.

CATTLE WASH.

Used on the Herds of H.M. the King.

What it will do.

CUTOXINE removes all dirt, prevents Scurf, improves the coat, promotes abundant growth of hair, prevents skin diseases, cures Ringworm, and destroys Lice and all parasites.

What it has done.

Testimonial from Mr. James Pool, Stewart to A. T. Cliffe, Esq., Belle Vue, Wexford, Ireland.

Dear Sirs,—I have used CUTOXINE for two years on Shorthorn Bulls. One year we gained First Prize at the Royal Dublin Show, and this year we obtained the record price for a yearling Bull. I consider that a great deal of our success was due to the condition of the animals' coats as the result of using CUTOXINE.

Sale of Berkshires at Motcombe.

A large number of Berkshire pigs from Mr. Arthur Hiscock's well-known herd at Motcombe, Shaftesbury, Dorsetshire, were sold by auction on October 26, by Messrs. Thornton and Co., and, as will be seen by the list appended, some capital prices were reached, the sixty-nine head averaging 11 guineas each. There was a large company present, notwithstanding the fact of the three sales of Berkshire pigs taking place almost within a week. Some Large and Middle Whites were also sold, and made good prices, although not up to those got for the Berkshires.

The Large White sow, Manor Fair Lady, realised 11½ guineas from Lord Wolverton, and the next sow, Manor Theodora, with a nice litter of nine, went at 15 guineas to Major Chichester, whilst the boar, Pride 2nd, went to Mr. Cox at 8 guineas. The sow British Lady, with a litter of nine, remains in Dorset with Mr. H. Christopher, Broadmayne, Dorchester, at 13 guineas. Church Belle came in with eleven one-day-old pigs, and realised 12½ guineas, to go to Lord Salisbury, Hatfield, who also bought her own sister, Church Lady, at 8½ guineas. In the Middle White section, the sow Waron Madge 3rd went to Mr. Brown,

Sale of Mr. J. A. Fricker's Berkshires.

The name of Mr. J. A. Fricker has long been associated with the breeding of Berkshires, the herd at Burton, Wilts, having been established over fifty years ago, and until last week no public sale had taken place on Mr. Fricker's farm. On Thursday, however, a choice selection was brought

Notes and Jottings.

FOR the past fortnight there has been a generally brighter tone prevailing in the beef markets of the country for both dressed beef and that on the leg, that it is not surprising that in the Metropolitan Market on Monday last a choice consignment of Aberdeens are quoted as having realised 5s. per stone of 8 lb. It is also very satisfactory to note that all other qualities experienced a better demand, and prices were a shade higher. West Highland Scots have touched the 4s. line for several weeks past, where broodstock and of good symmetry and quality. We should use the word symmetry because in the finished bull it means that he has a good back and well-filled hind-quarters where the best beef lies, and also that he has laid the flesh on pretty evenly.

THE brighter prospect for selling beef during the next few weeks is not confined to England or Great Britain altogether. America speaks in very satisfactory terms of the prospective prices for finished stock for the festive season, Chicago estimating that dollars will be freely parted with to secure the best class of beef steers or heifers of the improved breeds. It has been mentioned in these notes previously, that the foreign cattle landed at our wharves are of much better quality proportionately than the sheep that are sent there. The quotations in the markets at Deptford last week illustrate this in a very marked manner. The best States beasts on offer on Monday last stand at the quotation of 4s. 4d. to 4s. 6d. per 8 lb., which is only 2d. per stone below the quotation for Herefords and Devons in the Islington Market. Whilst for mutton the best sheep at Deptford are quoted at 4s. 4d. per 8 lb., whilst the best English at Islington reached 6s. 4d.

IT is not quite clear whether the lower proportionate price of the foreign sheep as compared with the home fed ones is due to the better general quality of the latter, or whether it is that sheep do not stand the ocean journey so well as cattle, and therefore come into the market in a more sinking and depreciated condition. One thing that seems to appeal strongly to the impression that a great deal of the better price obtaining for the cattle than the sheep is the fact that the foreign breeders of cattle have been much more liberal in their purchases of our best bulls for getting beef cattle, and for a greater number of years, than the buyers of sheep, the latter in a large number of cases having paid more attention to wool than mutton in their purchase of English sheep. In any case, the improvement wrought in foreign cattle stock by the importation so largely of British bulls has left and is leaving its mark.

A NOTE in last week's issue with respect to the housing of dairy cattle is exactly a repetition of the housing history in our forefathers' time. These dairy farmers of a century ago always kept their milk cows out in the field as late in the autumn as possible, and would tell you, "Yes, the first night the cows in the milk yield all milk." This is quite true, but there must be a line drawn as to the state and description of the cattle. We should be very sorry to trust a newly-caved cow out in the fields all night during the present changeable spell of weather, when the thermometer will often go down from a mild 50 or even 55 deg. at five in the afternoon to below freezing point ere daylight comes. We have known many a steer, even of the hardiest breed, to be placed *hors de combat* by a freezing temperature in the morning following a mild wet evening of the previous day.

THEN also a good deal hinges upon the food used. When lying out after November 1st, or, say, October 20, milk cattle must be prepared for the cold and damp by a good lining of warm food, as cake or meal, and it is quite a question then if the loss of manure occasioned and the souring of the pastures does not more than counterbalance the better yield of milk reported. With store cattle not in milk, there appears to be many advantages accruing to an outdoor life, a good deal of shedding room and labour is economised, and the cattle thrive very much better when the next summer grass appears, and with these, too, it often happens that no expensive cakes are being used, simply a little hay or oat-straw thrown

BERKSHIRE SOW, BURBIDGE XXII. AND HER LITTER.

Burbidge XXII., with her litter, won the First Prize in the Open Class for Berkshire Sows, in-pig or with litter of not less than six pigs, at the Tring Agricultural Society's show this year. She was bred and exhibited by the Hon. A. Holland Hibbert, Munder, Watford, and is by Munden Baronet 9472, out of Burbidge XX.

So thampton, at 13 guineas, whilst the boar Major Royalist was purchased for the Duchess of Newcastle at 8 guineas.

The total number of lots sold was ninety-two, and the aggregate receipts of the sale in the respective class were as follow:—Perks, 759 guineas; Large Whites, 12½ guineas; Middle Whites, 35½ guineas; total, 921 guineas, or 1967 ls. The sale of the Perks averaged 11 guineas each, which, recollecting the fact that some of the lots consisted of very young pigs, and also that only one lot reached anything like 40 guineas, must be considered quite a satisfactory average. The Large Whites averaged 28 6s. each, and the Middle Whites 25 6s. 6d. each—a result that goes very conclusively to show the high estimation in which the Motcombe pigs are generally held, especially as the catalogue this year included a number of very young animals, which naturally reduced the average. The chief sales of Berkshires were as follows:—

Sow Lady Victor, f Mar. 1, 1903; s First Rank F	17
Lord Wolverton	
Sow Manor Countess, f April 6, 1905; s Stratton Monarch	22
Mr. G. Tallourd Inman	
Sow Major Signet, f Aug. 29, 1904; s Grafton Squire 8860	27
Hon. C. Portman	
Sow Manor Duchess, f Sept. 1, 1902; s Cartwright	29
Duchess of Devonshire	
Sow Lady Dorchester, f Sept. 3, 1905; s Herrison Harold	13
Mr. A. Macan	
Sow Miss Wilmington, f Sept. 1, 1905; s Herrison Ronald	11
Lord Cadwor	

under the hammer, and a large number of breeders travelled to Burton, close to the old-fashioned Wiltshire town of Mere, to secure one or more of the well-known Brights or May Batten strains. The grand lot of old sows (with one exception), all bred on the farm, have seldom been seen at any public sale, and although only in ordinary condition, made excellent prices. Lot 2, Long Form F, was secured by Mr. Ransome, of Suffolk, at 17½ guineas; Lot 3, Bright's Keep-sake, to Mr. F. H. Jennings, at 15 guineas, also to go into Suffolk; and lot 4 to Mr. Arthur Hiscock, at 24 guineas, to join his herd at Motcombe. Lot 14 was considered one of the best pigs offered for sale this season, and was quickly purchased by Mr. Jefferson, of Peel Hall, at 28 guineas, who also secured the two following lots at 8 guineas each. Lot 18 went to Capt. Beltrams, in Yorkshire, at 20 guineas, and lot 19 to Mr. A. Macan, of co. Navan, at 16 guineas.

Among other good purchasers may be mentioned the Duchess of Devonshire, Lord Carnarvon, Lord Wolverton, Sir W. Corbet, Bart., Messrs. A. Brown, L. Currie, E. S. Green, G. Wood Homer, J. Lawrence, J. McMonies, and Mr. E. Wherry.

The trade was brisk throughout, many of the breeders having sold a large number for exportation during the last few months, and an average price of 45 11s. 4d. was obtained for the eighty-three lots sold, sixty-six of which had been farrowed this year.

on the grass. Where cake is used for this class of stock it is generally for the purpose of causing the cattle to pull off a lot of old coarse grass that has been left from the summer feeding.

WHILST upon the subject of the winter dairy and the outlying of the cattle, it is perhaps worth while to make a note that as a rule there are more complaints about bad flavour in butter just at this time of the year than at any other during the twelve months. Many producers of the highest class of butter at other times of the year are often at their wits' end to know why it is that their butter possesses a taint or a flavour that is not only unsatisfactory but even damaging to the credit of the dairy. More often than not—indeed, we may estimate that 90 per cent. of the complaints of the flavour of butter at this time of year are caused by the cows picking up the fallen foliage of trees. The leaves of some trees, notably the horse chestnut, gives a very unpleasant flavour to butter, and at this time of year cows will pick up and often eat greedily the foliage that has fallen and withered under the trees.

BREEDERS of Lincoln Red Shorthorns are rightly making a move to get their breed well represented at the forthcoming Royal Show at Lincoln next year. A good sum of money appears to have been voted to add to the prize list, and there is certain to be a good show of this breed upon the occasion mentioned. The breed is one of our most useful all-round breeds, and is improving rapidly year by year. It is true that the leading honours at the recent London Dairy Show did not fall to a specimen of this breed; nevertheless, those that were shown gave an excellent account of themselves, and in many of the milking trials at other shows during the past year or three years or more, Lincoln Reds have carried off first honours. At Dublin and Belfast, especially, has the herd done well, and it is much to its recommendation that animals sold to Irish breeders are still retaining their good form in their adopted country.

THE display of cattle at the great Argentine Show at Palermo appears to have struck English visitors very much, the native bred Shorthorns being especially good. The Argentine has long been known to produce beef in its best and tastiest form, and it is pretty certain that this is one of the reasons why these native bred Shorthorns gave such an excellent account of themselves. Many years ago, when the Argentine was in a state of unrest in its government, and before the wealth of its land for agricultural and stock breeding purposes had become known to the world at large, an old schoolfellow of the writer's who had settled there, informed him that he fattened Shorthorns up to a ton weight on grass alone. When development of this kind can be produced by Nature alone, so to speak, animals will naturally make the best of themselves, and probably those that have been bred there, and are perhaps only one remove from their British ancestors would probably make quite as good a show as recently imported stock.

ANOTHER great point in favour of the Argentine as a cattle raising country is its very slight winter. Cattle are practically, according to all we hear, able to make progress the year round on much less exacting terms from house feeding than is the case in England, and where steady progress can be maintained so easily the symmetry of the animal seldom suffers, neither does the wealth of flesh decrease. At home when winter makes its appearance many cattle that are what may be termed well cared for, lose their shape considerably, and it frequently happens that when once lost the earlier refined symmetry is not regained even though considerable expense may be lavished upon the animals.

THE show appears to have been a very extensive one as regards numbers, seventy-one bulls being shown in the three-year-old class of Shorthorns. Prices in the show at auction also appear to have been what may be called most satisfactory, such sums as £1,913 English money being paid in one instance and £2,174 in another, for native bred Shorthorn bulls. Prices very little lower were also paid for other bulls, those quoted being for prize and champion winners. A country possessed of immense wealth in corn as well as a wealthy soil and good climate, and peopled with a people enthusiastic in their stock-breeding enterprise, will surely develop into at least one of the leading cattle breeding countries of the world, both as regards quality and quantity of its cattle. Time will prove to what extent the native bred stock will need replenishing with imported blood.

JUDGING from the different photographs of the stock exhibited at the various shows, this fall in Canada and the States the beef breeds, both Shorthorns, Herefords, and Angus appear to have been wonderfully well represented in numbers and to have been well brought out, and, we may add another very important remark, well selected.

Charges for announcements under this heading, Six Shillings an inch.

AUCTION SALES.

Auctioneers will favour us by sending in their advertisements as early in the week as possible.

By **SEXTON, GRIMWADE & BECK.**

BLAGDON SHIRE STUD,
BILLINGTON, LEIGHTON BUZZARD,
BEDS.

3 miles from Leighton and Cheddington, L. & N.W.R., 5 miles from Dunstable, G.N.R. Stations.—Conveyances meet trains day of sale.

UNRESERVED SALE of 43 SHIRE HORSES of the Best Blood on WEDNESDAY, NOVEMBER 7, 1906, after 12 o'clock Luncheon.

MESSRS. SEXTON, GRIMWADE & BECK (of Peterborough) have received instructions from Mr. CLEMENT KEEVIL to conduct this high-class Sale as above, which will include 12 Shire Foals, several by Blagdon Benefactor (21144), Lockinge Midnight (19780), Birdall Menestrel (19337), Dunsmore Jameson (19792), &c.; One, Two, and Three-Year-Old Fillies; Yearling Stallions; also one Three-Year-Old by Lockinge Forest King (18867), and some exceedingly well-bred in-foal Mares, which are good workers. Catalogues on application.

The London & North-Western Railway Co. are specially stopping the 10.10 a.m. train from Euston Station, London, due at Leighton 11.10 a.m. on the day of Sale.

By **FOX & CO.**

EDENBRIDGE, KENT.

SEVENTH GREAT ANNUAL HAY AND STRAW SALE.

FOX & CO. will SELL BY AUCTION at the CROWN HOTEL, EDENBRIDGE, on MONDAY, NOVEMBER 12, 1906, at Three o'clock (present entries of) about

670 TONS

of excellent MEADOW and SEED HAY, the whole being of the best quality and exceptionally well got; about 40 LOADS of CLEAN WHEAT STRAW, and 12 LOADS of OAT STRAW. The Ricks are lotted, and can be viewed at any time prior to the Sale after the issue of the Catalogues.

Full descriptive Catalogues may be obtained of Messrs. Fox and Co., Land and Timber Surveyors, Edenbridge, Kent. P.O. Telephone, No. 11.

READERS OF ADVERTISEMENTS

in these pages will greatly oblige and assist us by mentioning . . .

THE MARK LANE EXPRESS

when writing to our Advertisers.

The American breeder, whether he be a North or South American, has many advantages over the Britisher in having such large numbers to select from. There is certainly much more opportunity to select one good one or twenty good ones from a herd of several hundred head than from the limited numbers that most people who are breeders of cattle in Great Britain have from which to choose their exhibition specimens. In our own country breeding is, we may say, everything; in these larger countries selection is a great deal.

LOOKING over some cattle in Ireland some time ago the owner informed me that in order to get his one steer or heifer for exhibition he mated his cow or heifer with the bull he could find best adapted as likely to make up in the offspring any deficiencies that might chance to be apparent in the dam. Nothing was thought of sending the cow or heifer a journey of a hundred miles or more to obtain a satisfactory mate. This is breeding in the highest sense of the word, and the results obtained justified the steps taken to obtain them. But what a study of needed points was this. The many little ins and outs to be balanced up, the size, the strain, likely to milk; it is all a science, and worth the consideration, and the man who succeeds in breeding a first prize winner and champion when he has but perhaps one female to mate must be reckoned amongst the cleverest of the clever, such success following my Irish friend's choice.

HORNE'S GREAT SALE.
CLIFFE (NEAR ROCHESTER), KENT.

MESSRS.

PROTHEROE & MORRIS

Are instructed by MESSRS.

W. HORNE & SONS

to hold a GREAT SALE of FRUIT TREES and POTATOES on the Premises,

PERRY HILL, CLIFFE, NEAR ROCHESTER, KENT

adjoining Cliffe Station, South Eastern Ry.), on **WEDNESDAY, NOV. 14th, 1906.**

150,000
FRUIT TREES
AND BUSHES

of all kinds, including several thousand

STANDARD APPLES, PEARS, AND PLUMS.

Also a very fine lot of Pyramidal Apples, 1, 2, and 3-year on English Paradise. About 50,000 Half-Standard Apples on Crab Stock; also Pears and Plums. About 20,000 Black Currants, 40,000 Gooseberries (including 5,000 May Duke), 15,000 Red and White Currants, 50,000 Raspberries, 20,000 Asparagus Plants, and several thousand Strawberry Plants, several tons Scotch Potato Seed, about 1,000 Loganberry Plants.

Free Luncheon at 11 a.m. Sale at 11.30 a.m. NOTICE.—The Auctioneers desire to call the attention of Fruit Growers, Market Gardeners, and intending Planters to this important Sale. It is seldom such an opportunity offers itself for securing new and rare kinds of Fruit Trees, etc., in such large quantities. All are well grown and healthy; they are without doubt the finest lot of Fruit Trees ever yet offered at Cliffe.

Fourteen days will be allowed to clear and settle Accounts. Messrs. Horne and Sons will lift and cart all lots and put them on rail after the Sale free of charge. Catalogues free of Messrs. Horne and Sons, Cliffe, near Rochester, and of the Auctioneers, 67 and 68, Cheapside, London, E.C.

IRELAND'S NORWICH HILL
AUCTION MART.

Established 50 years.

Special Autumn Store Cattle Sales,

Every Saturday.

Commencing SEPTEMBER 22, 1906.

MESSRS IRELAND solicit consignments for these Important Weekly Sales; best market value assured.

Cattle consigned to Ireland's, Norwich, will be properly fed and carefully attended to.

All cattle weighed upon entry to the Sale Ring if desired.

Full particulars to be sent to—

IRELAND'S, Auctioneers,
Norwich, Norfolk.

Sale of Red Polls at Ipswich.

Messrs. Robert Bond and Sons twentieth annual sale of pedigree Red Polls at the Drill Hall, Ipswich, took place on Tuesday, when about sixty animals were offered, they being from numerous Suffolk and Norfolk herds. There was a good attendance of buyers. The best animals were in good demand, and satisfactory prices. The prices for bulls calving in 1905 or 1906 were judged by Mr. D. F. Smith, of Easton, who awarded the first to Mr. Alfred Smith, Rendlesham, and the second to Mr. C. F. Newton, Saham, Norfolk, but the second prize animal fetched 8 guineas more than the first prize winner, the respective figures being 28 guineas and 20 guineas. These, together with 20 guineas obtained by Mr. T. Tindal, Methwold, were the best prices for bulls, the others selling from 18 guineas downwards. Cows and heifers made up to 24½ guineas, got by Lord Cranworth, whilst another of his cows with a calf fetched 24 guineas. But this figure was beaten by Mr. R. Eaton White, who sold a cow and her calf for 30 guineas; other prices ranged up to 18 guineas.

Kidderminster Store Stock Sale.

Messrs. Nock and Joseland held their special autumn sale of store stock at Kidderminster on Friday, October 26, when they were favoured with a first-class entry of stock, which numbered nearly 600 cattle and 1,311 sheep and lambs. The cattle

included some capital entries of home-bred Hereford and Shorthorn bullocks and heifers in forward condition for winter feeding, and the best quality met a ready sale. Amongst the best lots were 21 two-year-old Hereford steers from Mr. Evan Thomas (Kinlet), which made up to £16 5s. per head; 33 Mr. Jos. Blackford (Duncott), £15; 8 Mrs. Gittens (Stottessen), £13 17s. 6d., and others up to £13 2s. 6d.; whilst 6 Shorthorns from Mr. W. Dorrell (Envillo) made £14 15s.; 23 Mr. H. Oliver (Elmley), £14 15s.; 90 Mr. J. Green, £14, and several others £13. The sheep and lambs were a very large entry, being several hundreds over the figure advertised, and met a good demand: 60 beautiful Kerry wethers from Mr. T. H. Whiteman (Leominster) making up to 47s. each; 300 Shropshire and Radhurs from Mr. A. Hodggets (Northfield), 45s. 6d.; 100 Shropshire and Hampshires from Mr. J. G. Green, 48s. Store lambs totalled over 1,200 head, the majority ready to go to roots at once; 100 Shropshires from Mr. F. Smith (Worcester) reaching 43s. each; 70 Mr. Mark Southall (Wannerton), 41s.; 200 Mr. J. G. Green, 39s. 6d.; 160 Mr. A. Hodggets, 37s. 6d.; 80 Mr. H. Oliver, 36s.; 20 Mr. W. O. Attwood (Alveley), 34s.; 20 Mr. H. Nickless (Woodcote), 36s. 6d. Sixty in-lamb ewes from Mr. J. G. Green made up to 48s. 6d. each.

South Devons for New Zealand.

It is interesting to find that a consignment of the above has just been shipped off from London by the s.s. *Ruapelin* to Wellington, New Zealand, and purchased by Mr. George Pain of that country. This being the first consignment of the breed to that far-off land it is hoped they will arrive safely, and no doubt they will thrive in that colonial climate equally as well as they have in other countries to which they have been exported.

This selection of six heifers (in-calf) was made from the well-known herd of Mr. Fred W. Rowe's, Trevego, Lostwithiel, Cornwall. These heifers were all sired by that famous cup-winning bull Merry Boy (1495), champion of the breed at this season's shows. The bull selected by Mr. Lowe to go out with the heifers was sired by a fine cup-winning bull, Saltrem.

The South Devon breed of cattle have come to the front very much of late years, since it has been proved that their combined qualities for producing beef and dairy produce is excellent. The Trevego herd has, amongst other winnings, taken the coveted Championship at the West of England Fat Stock Show against all breeds three times, also first prize at the Smithfield Show, 1905. As milk and butter producers it has been proved by Mr. Thomas Cundy, Devonport, one of England's most successful dairymen at the Royal Dairy Show, London, that the South Devons want a lot of beating.

Transactions in Store Stock.

(Reported to the Department of Agriculture and Technical Instruction for Ireland.)

At Collooney Fair, co. Sligo, held on October 31. Large fair, brisk demand for all classes of cattle, and a good clearance effected. Calves, 1st class, £4 10s. to £6; 2nd class, £4 to £4 10s.; yearlings, 1st class, £8 to £9; 2nd class, £4 to £7 2s. 6d.; two-year-olds, 1st class, £11 to £12; 2nd class, £9 to £10 10s.; three-year-olds, 1st class, £14 to £15 10s.; 2nd class, £11 10s. to £12 15s.; eweagers, 1st class, £16 10s. to £18 5s.; 2nd class, £12 10s. to £14 5s. Good lambs very dear; 1st class, £1 16s. to £2 2s.

Sale of Mr. J. Dean's Farm Stock.

Messrs. Waters and Rawlence, of Salisbury, submitted to auction at Chitterne, Wilts., on Wednesday, the greater portion of the live and dead farming stock, the property of Mr. J. Dean. A very large company was present, with the result that a most satisfactory sale was effected. The sale commenced with 200 lots of dead stock, which sold extremely well, elevators making £25 18s. and £17; waggons, £22, £19, £15 (twice), £13, &c.; carts, from £8 10s. to iron water barrels, 9s. 10s., &c. £6 10s., &c.; a strawson's sprayer, £12 10s.; broadcast, £10; Albon mowers from £10; four-horse sets of harness, £14, £11, &c.

A luncheon was then partaken of, the sale being resumed with 225 registered Hampshire Down ewes of the old Chitterne blood. Thirty two-teeth ewes in four lots made 80s., 76s., 72s., and 74s. respectively; 45 four-teeth ewes, 70s., 66s., 64s., 61s., and 59s.; 80 six-teeth ewes, 65s., 64s., 61s., 59s., 57s., and 52s.; 70 regular draft ewes, from 47s. to 54s., the whole averaging 60s. per head. The teams of cart horses made 46 guineas, 45 guineas, 43 guineas, 41 guineas, 39 guineas, 37 guineas, 36 guineas, 34 guineas, and 32 guineas (twice) for the younger horses, older ones making from 31 guineas downwards. A cob turn-out made 42 guineas, and a brown nag mare 24 guineas.

SHEEP.

Notes and Jottings.

HEAVY rains have hastened up the conditions of winter sheep keeping, but fortunately frost keeps away, so there is still a rapid growth of roots. November is generally the month when swedes put on their greatest weight, the dying down of the under leaves sending a supply of nutriment to the bulbs. The sheep pens are sticky now, and we reiterate recent remarks as to the necessity of keeping the claws clear of leaf stalks and dirt, or lameness will inevitably be set up.

WHERE the straw coverings of mangel heaps become saturated in the heavy rains, either fresh straw next to the roots, or special care in covering in other ways should be provided, for wet straw is a good conductor of frost, and frost follows wet into a clamp very readily. It is the layer of dry straw that acts as a non-conductor and breaks the influence of frost when the earth covering gets frozen through. There is no food to spare this year in many places, therefore there is greater need of precaution against loss by frost.

NEW ZEALAND has a way of reminding the Mother Country of her duties whether in time of war or peace, and there is generally sanity in the suggestions made by these energetic colonials. "From dingoes, drought, and scab," was the old-time litany of the Australian squatters, for if delivered from these they had easy times. They would probably add rabbits to their prayer now. The New Zealanders have rabbits galore, and have been very severe on scab, and the National Sheep Breeders' Association, at their meeting to-morrow, will deal with a resolution from the New Zealand Sheep Breeders' Association, asking them to use their influence to press the Government to increase their efforts to stamp out sheep scab. The long period of quarantine to which sheep imported from England into Australia and New Zealand is largely due to the existence of scab among British flocks, which acts as a hindrance to the importation of fresh blood. New Zealanders are making money fast, and can afford to spend money on their flocks and it is unsatisfactory that the laxity of a few English flock owners should stand in the way of the good business which might be done with those down under. Such men as those who are associated with the association know well how useful it is to stamp out the disease, and it is only a comparative few negligent men, with no public spirit, who have hindered its extinction. However hard the association presses the matter, its members may be sure of full support from the majority of flock owners.

THE Hampshire breeders boast their "Derby" for the flock competition at Salisbury Fair, and some other societies give prizes for flocks or sections of flocks, but for the extent and comparative usefulness of the breed it is doubtful if any breed benefits so greatly as the Suffolk from breed competitions. It is fortunate in having a number of challenge cups offered by spirited landowners, and the annual competition for these always brings about a good entry. They give those who have not yet reached the stage of exceptional success in the showyard an opportunity of demonstrating that their flocks are in an improving condition, and thus many who hesitate to enter showyard competition have courage to enter when they know that the general level of their flocks is high, while those which have become well known through showyard honours have to demonstrate that not merely can they find a few good animals for exhibition, but that they have good flocks throughout. Not a little of showyard success is due to smart preparation; on the exceptional merit of a few animals, therefore, great good is done when a stimulus of this sort is provided for the man who keeps a good working flock.

AFTER a run round Ireland, where every little association manages to get hold of a grant from one or other of the Government bodies with money at disposal, and where the tenant farmer does not particularly exert himself in matters of self-help, and where over £100,000,000 has been found from British funds to give the tenants the opportunity to buy outright their farms for a less annual sum than they paid previously as yearly rent; and whilst each successive Minister of Agriculture pleads his inability to raise even a trifling further sum for the benefit of British agriculture, one cannot help seeing how unfair the position is to the British farmer.

A CASE in point occurred recently when the newly-formed Welsh Mountain Sheep Breeders' Association had to refuse the invitation of the National Sheep Breeders' Association, great

as they saw the advantages would be on the grounds that with initial expenses to be met, they did not feel themselves in a position to pay the affiliation fee.

THE Irish have done practically nothing to develop their native breeds, and have missed much by not doing it. English, Welsh, and Scottish farmers have done one of the finest pieces of work in the world's agriculture in saving the many breeds which have been brought to such high excellence. If it is right to encourage those who have done little for themselves, it is equally right to help those who are struggling under quite as hard conditions, but who are left to prosper or otherwise because they are prepared to work harder.

THERE is no place for sheep on small holdings or there might be more sympathy shown. Farmers are preached at because they do not co-operate enough. A sheep breeders' association is a very worthy form of co-operation, but though money is found out of public funds for co-operation in Ireland, it cannot be found for a Welsh or English association.

IT is satisfactory to see a strong entry of new members to the Southdown Society. Hard times in farming and encroachment by other breeds have lowered the census of the Southdown; but it is by far too good a breed not to be maintained in good number. If all the mutton sold as Southdown out of Southdown-raising districts were really Southdown, one might have great ideas as to the numbers kept. The London quoted price of Southdown mutton is misleading. So-called Southdown mutton, which has only one parent Southdown, and sometimes not even one, is offered in practically every high-class shop at prices far below what the genuine meat fetches in Sussex. This tells much against the interests of the breed.

Kirkby Stephen Sheep Fair.

This historical sheep fair was held on October 27 for the 555th time, the original charter having been granted to Roger de Clifford as far back as in the reign of Edward III. Usually from 15,000 to 20,000 sheep, mostly of the Black-faced type, are penned for sale in the main thoroughfare of the town, but this year the number fell to 8,000 or 10,000, owing to dealers having bought up large flocks before the fair. On account of the scarcity thus occasioned and the prevailing high prices, vendors stood out for advanced figures, and a dead sale resulted. Prices ranged as follows: Black-faced wether hogs, 12s. to 22s.; Black-faced gimmer hogs, 17s. to 23s.; Black-faced ewes, 24s. to 30s.; Black-faced rams, £2 to £4; Black-faced shearing rams, £4 to £6 10s.; Black-faced ram lambs, £1 to £2; Grey-faced hogs, 22s. to 30s.; Grey-faced gimmer hogs to 40s.; Grey-faced ewes to 50s.; Wensleydale rams, £4 to £7.

Sheep Dipping: An Interesting Case.

An interesting case in connection with the Board of Agriculture's Sheep Dipping Order was heard before the West Riding magistrates at Barnsley on the 26th ult. Samuel Bridge, farm bailiff, and his employer (Mr. Bingley, Gnoswick), and Thomas Bridge and Frank Bridge, farmers, of Langsett, being summoned for breaches of the Sheep Dipping Order by using a sheep dip not approved by the Order. Defendants used a dip of creosote oil, soft soap, and water. When Mr. Bingley was told this was not an approved dip, he said it had proved to be the best dip and he would back his opinion against the Board of Agriculture.

Mr. Hamersley, of Leeds, an Inspector of the Board of Agriculture, admitted the defendants could dip as often as they liked with creosote oil, so long as once during each of the specified periods they used a dip approved under the Order.

For the defence, Mr. Bingley said the dip made of creosote oil and soft soap and water had always proved very beneficial. On the occasion of a case of sheep scab he used patent dips without success, and the house mixture referred to succeeded. It was admitted by the county veterinary surgeon that it was a good cure. He submitted they could have no better guidance than that.

On behalf of other defendants, Mr. Hamersley said that for forty years the mixture used in the case had been found to be the most successful of all. He had a list signed by 370 farmers testifying to the efficiency of the creosote oil and soft soap as a dip.

The Bench considered a medical officer had been committed. The case against Samuel Bridge was dismissed, and the other defendants were fined 20s. each and costs. The Chairman (Mr. C. Brady) said the weakness of the defendants' case

was that they did not send a sample of their tip to the Board of Agriculture and obtain sanction to use it. Notice of appeal was given.

Sheep and Cattle Sale at Ashford.

Messrs. W. and B. Hobbs' annual sheep and bullock sale at Ashford took place on the 26th ult., and was well attended, whilst there was a brisk trade all round. Among the lambs several lots went up to 30s. 6d. from about 27s. 6d. The ewes made up to 48s. for the best, and some good runs were disposed of. The run from Mr. Dee Swaffer of upwards of 200 made 45s. 6d., 43s. 6d., 48s., 40s.,

47s., 45s., 36s., 31s., 27s. 6d., 44s., and 40s. 6d., whilst another good run from Mr. E. H. Long made 47s., 46s. 6d., 47s., 46s., and 41s. Other ewes of not quite first class quality ran from about 27s. to 32s. 6d. The ewe tops sold up to 55s. 6d., but the majority made from about 30s. to 40s. A good run of Mr. John Hodge's tegs made 30s., 41s. 6d., 45s. 6d., and 37s. 6d. for the half-breds, and 41s. 6d., 48s., 43s. 6d., 47s., and 42s. 6d. for the Kent wethers.

The principal runs among the beasts were a number of black polled heifers belonging to Mr. John Ho, and these, sold in lots of four, made £6 15s., £7 15s., £8 5s., £8 15s., £8 15s., £9 5s., and £8 5s. The two-year-old fatting heifers of the same breed made £9 15s., £9 5s., £10 15s., £10 10s., £12, £11 15s., £13, £11 10s., £13 10s., and £14 for lots of two each. Other yearlings ran from £3 5s. to £6 15s.

Southdown Sheep Society.

At the meeting of the council of the Southdown Sheep Society, held at the society's offices, 12, Hanover Square, W., on Thursday, October 25, the chairman (Mr. H. Padwick), read a letter from the Duke of Richmond and Gordon, stating that he would have much pleasure in accepting the presidency of the Southdown Sheep Society for the year 1907.

The representatives of the society on the Council of the National Sheep Breeders' Association for the year 1907 were elected as follows:—Mr. Herbert Padwick (vice-president), Sir Thomas Barrett-Lennard, Prizes, Mr. Allan Cooper, and Mr. Henry Webb.

PRIZES, 1907.

The council then took into consideration the question of the prizes to be offered by the society for Southdowns at various shows during 1907, and unanimously decided to offer next year similar prizes to those granted in 1906. The complete list of prizes to be given by the society in 1907 will therefore be as follows:—

Royal Agricultural Society.—Champion Gold Medal, value £10 10s., or £10 10s. in cash, for the best Two-Shear or Shearling Ram; Silver Medal for the best pen of Ewes or Ewe Lambs; Prizes of £10, £5, £3, for Two-Shear Rams; Prizes of £10, £5, £3, for pens of three Shearling Rams.

Royal Counties.—Champion Gold Medal, value £10 10s., or £10 10s. in cash, for the best Ram or Ram Lamb; Silver Medal for the best pen of Ewes or Ewe Lambs.

Bath and West.—Prizes of £10, £5, £2 for Two-Shear Rams; Silver Medal for the best Ram or Ram Lamb; Silver Medal for the best pen of Ewes or Ewe Lambs.

Sussex County.—Champion Gold Medal, value £10 10s., or £10 10s. in cash, for the best Ram or Ram Lamb; Silver Medal for the best pen of Ewes or Ewe Lambs.

East Kent, Essex, Gloucestershire, Norfolk, Oxfordshire, Suffolk, Tunbridge Wells.—Silver Medal for the best Ram or Ram Lamb; Silver Medal for the best pen of Ewes or Ewe Lambs.

The report of the International Conference of Sheep Breeders held at Derby in June last was duly received.

THE ARMY MEAT QUESTION.

The council having been asked for an expression of opinion on the subject of the recent change in the form of army contracts for meat and forage, decided unanimously that they strongly support the following resolution on the subject which was passed at a meeting of the Irish Cattle Breeders' and Stock Owners' Association and that the Secretary of State for War and the President of the Board of Agriculture be informed accordingly:—

"That this meeting protests in the strongest manner against the change recently made in the Army meat tender form, under which contractors can supply foreign meat killed at the port of disembarkation, instead of native home-bred meat which was guaranteed to be used by the late Government some years ago. We believe the change is a violation of official promises, and most unfair and prejudicial to the agricultural interests of the three Kingdoms. We also protest against the feeding of army horses mainly upon foreign oats, straw, and hay, and we call upon the Secretary of State for War to reconsider his decision upon this important question in the interests of the taxpayers, ratepayers, and employers of the three Kingdoms."

Twenty-eight new members were then elected. The flocks of Mr. A. Fels and Mr. Frank Moore, and a new flock started by Mr. F. H. Jennings were accepted for registration without inspection, they consisting solely of sheep brought from registered flocks, while arrangements were made for the inspection of twenty-nine other flocks tendered for registration.

SUGGESTED FOREIGN MEMBERS.

The chairman read a letter that had been received from Mons. R. Eustache, Domaine du Chasnay, par Fourchambault, Nièvre, suggesting that foreign breeders should be admitted into the society, and foreign flocks registered in the Flock Book, on condition that the flocks must be all

pure-bred Southdown ewes, selected exclusively by English-bred Southdown registered rams. Mons. Eustache expressed the opinion that such action would undoubtedly induce a greater number of Foreign breeders to purchase rams in England, thus tending to benefit both France and England. "another welcome result of the London Conference." The secretary was instructed to thank Mons. Eustache for his very interesting letter, and to say that before coming to a decision in the matter the council would be glad to have particulars as to the probable number of breeders who would be prepared to join the society, and as to whether they would be willing to conform to all the rules and regulations of the society in respect of the registration of sheep.

Hampshire Down Sheep Society.

A meeting of the council of the Hampshire Down Sheep Breeders' Association was held in London on Monday, the Hon. A. H. Baring (president-elect), in the absence of the president, presiding. Twenty-seven new members were duly elected.

Mr. Cary Cole was unanimously selected for the post of president-elect for 1907, whilst the annual meeting was fixed for Wednesday, December 12, 1906, at the Agricultural Hall, Islington.

The reports of the editing and finance committees were presented by Messrs. J. Flower and H. Lambert respectively and adopted.

It was unanimously decided to continue the sheepbreeders' prize competition as heretofore. A motion by Mr. Kerr to slightly alter bye-law 10, of a technical nature, was carried. A further motion by Mr. Kerr as to the official ear-marking was considered, and finally relegated to the editing committee, Mr. Kerr to consider and report to the council thereon at the January meeting.

Applications from the Royal and Bath and West Societies as to the prize-list contributions were considered, and it was resolved to contribute £20 as heretofore to the Royal Society, with an addition of £3 as third prize in the two-shear ram class, and £10 to the Bath and West Society in two prizes of £7 and £3 in the ewe lamb class.

Lincoln Longwool Sheep.

The council of the Lincoln Longwool Sheep Breeders' Association met at Lincoln under the presidency of Sir John H. Thorold, Bart., on the 25th ult., when it was agreed that prizes for three-yearling ewes, shown in their wool, at next year's Royal Show, be increased to the following amounts:—The first prize to be £25, the second £20, the third £15, the fourth £12, the fifth £10, and the sixth £8. In addition there are to be gratuities to the shepherd in attendance upon the winning pens.

Applications for admission to membership were received from several gentlemen, and arrangements were made for the inspection of their flocks.

Welsh Flock Book.

A committee meeting of the Welsh Flock Book Society was held at Chester on October 26, 1906, when the treasurer reported that there was now no money owing to the society excepting the payment for the blocks for the pictures in the first volume of the Flock Book, and a statement of accounts, which showed a balance in hand of £21 16s. 21s., was passed.

Mr. W. Ellis Upjohn was appointed secretary, and Mr. J. Marshall Dugdale kindly consented to continue to act as hon. treasurer.

With regard to Professor Winter's query at the last meeting as to whether all the sheep entered had been inspected, it was found that in several cases inspection judges had inspected their own sheep, so it was decided to make the following instruction:—"That all sheep must be inspected before being entered by an inspection judge, who must sign the entry form, and that no inspection judge may inspect his own sheep."

A letter was read from the secretary of the National Sheep Breeders' Association setting forth the advantages which would be derived from affiliation with their society, the affiliation fee being five guineas. It was decided that the financial position of the Welsh Flock Book Society was not yet sufficiently good to allow them to join the National Society, although the great advantages were apparent.

A letter was also read from Mr. R. N. Jones, of Brynmelyn, Corwen, suggesting that the society should offer a prize or two next year for a pen of Welsh ewes and a breeder's prize for same. It was decided that the society's financial position was not at present such as to warrant this.

The question of selecting judges for shows was deferred till the next meeting. With regard to the inspection of ewe lambs it was decided to follow the same lines as those adopted by the Shropshire Flock Book Society, a copy of which Mr. Conwy Bell kindly supplied.

Volume II. of the Flock Book was discussed, and it was decided the first day of entry to be February 1, 1907.

Messrs. Cranfield Bros.' New Mill at Ipswich.

The town of Ipswich is a very busy centre for many trades, of which engineering is the most important as employing the most hands, and milling is by no means the least. Both of these trades have been carried on in the town for a great number of years, but for our present purpose we will not go further back than 1884, which year saw the opening of the first flour mill on the roller system in the district. The enterprise of Messrs. Cranfield Bros. brought this about by the erection of their mill on the dock, which has been running ever since up to April this year, and their wonderful success soon compelled other millers in the neighbourhood to convert from stones to rolls, besides inducing new men to try their luck in a trade which seemed to yield such profitable results.

Messrs. Cranfield in those days were content with a mill which had an output of seven to eight sacks per hour, but as time went on and their trade kept increasing, the output had to keep increasing also until it reached the total of over 2,500 sacks of flour per week. This naturally meant overcrowding the building, which was originally erected with machinery to obtain the

The new mill is a fine spacious building on the same block of ground as the old one, but further from the quay, the wheat warehouses coming in between, so that the very best use is made of the dock frontage. The entire building is 138 ft. long, the mill itself being 82 ft. long, separated by the rope race (above which is the water tank for feeding the sprinklers) from the wheat cleaning department, which is at the end furthest from the dock. The entire building is 51 ft. wide, and the engine house is built out at right angles to the mill, so that the main drive runs into the rope race.

The engine is a steam engine of the coupled compound condensing type by Messrs. Cole, Marchant, and Morley, Ltd., and the boiler a Lancashire type by Messrs. Ruston, Proctor, and Co., Ltd.; both are for a working pressure of 160 lb. per square inch, and capable of developing 460 h.p.

In the wheat-cleaning department are a complete set of wheat bins for dirty wheat, washed wheat, conditioned wheat, clean wheat, &c., sufficient for the different qualities to be kept separate, and all necessary machinery for washing, drying, and conditioning; separators, barley and cockle cylinders, smutter and brush machine, with mixers fixed under the bin bottoms for giving

their respective positions with very slight alteration to the present flow, whilst there will be ample room to get at all the working parts of the machines when the additional machines are put in.

Weather, Crops and Stock.

IN the spring time of sowing the seed the weather was extremely cold and boisterous, and in consequence the sowing was later than in previous years; moreover, the potato tubers were also behind their usual time in planting. But thanks to the growth during the favourable weather, and heavy rains in August and dry and beautiful September, yields are equal to any previous season. Very few are diseased, and the size of the tubers is up to the standard in average to any season for the last forty years, so that we can produce a sample of clean, bright, marketable potatoes, not inferior to any sample that I have been sending to the English and foreign markets for the last forty years. But, alas, I do not find the new varieties introduced to be equal in flavour to the old varieties, or in taste, or as palatable. To suit the constitution of the old consumers we have still planted a few of the old varieties, and I find for my own family use that 1 stone of the production of the old varieties are of more value than 4 stone of the new kinds introduced by the most expert of professors. From May till August we had various changes of weather, but enough of rain to make the grass grow. The grains of all kinds were only gradually growing up till August 1, when we had a change of weather; it turned warmer, and from then up to the 10th ult. we had a summer of mild

THE ROLLER FLOOR IN MESSRS. CRANFIELD BROS. NEW MILL AT IPSWICH.

required surfaces, and the inevitable result was that a new mill should be erected with ample space for a plant of still larger output, and not only that, but with space for further extending that plant whenever it might be necessary.

In the early days of roller milling there was not a great number of engineering firms who had studied the system, and it was not unnatural that Messrs. Cranfield should decide to place their order for machinery with Mr. J. Harrison Carter, not alone because of his reputation as one of the leading roller mill engineers of the day, but also because they were aware that the machinery, which formed an integral part of his system, was made in the town with which he had decided to throw in their lot.

Thus it came about that the machinery which did duty for exactly twenty-two years in the Dock Roller Mills was manufactured by Messrs. E. R. and F. Turner, of St. Peter's and Greyfriars Works, Ipswich. No doubt to the lay mind the fact that this machinery had done duty, and done it well, for all these years would be quite sufficient to ensure the next order being placed in the same hands, but to a keen business firm this is not a natural sequence at all; in twenty-two years many changes take place, and however good machinery made that length of time ago may be, unless the makers have kept themselves up to date and in touch with the most recent requirements of the trade, it might be the worst policy to allow them to install their machinery in a mill which would have to meet the competition not only of the present day, but also of the future for many years to come.

Needless to say, a business-like firm such as Messrs. Cranfield's is well known to be, did not allow mere sentiment to overrule their better judgment, and it was not until they had made a complete investigation and thoroughly tested Messrs. Turner's most recent productions that they decided to entrust the order for machinery for the new mill in their hands.

the right proportions of the different kinds of grain, which is conveyed by means of the mixing worm and an elevator to a finishing brush, and from this latter is conveyed through the rope race to the machinery for grading the wheat to the first break rolls.

The breaks are done on 6—60 by 10 in. four-roller mills of Messrs. Turner's latest diagonal pattern, each pair of rolls being provided with double feed, which give a splendid evenly distributed feed right along the rolls, and deliver the material well into the nip of the rolls without the intervention of a feed plate. With a really good feed distribution and automatic hoppers, which are thoroughly efficient, the work of a roller mill is as good as done, and it is unnecessary to say more than that these mills are doing absolutely perfect work.

These remarks apply equally well to the reduction rolls, of which there are fourteen—40 in. by 10 in.—all of which are also fitted with double feed-rolls, and have in addition Turner's patent scrapers, which deliver the stock in splendid condition for dressing. On the two floors above the roller stand two lines of Turner's latest pattern double purifiers, nine in number, which, whilst embodying all the good points of their older pattern, have several very marked improvements which certainly bring them well to the front amongst such machines.

The hexagonal reels used for the scalping system are placed on the second floor, directly over the brake-rolls, and the centrifugals for dressing are placed on the two top floors in tiers of two; there are fifty-one of these, all of Turner's latest pattern, with self-oiling bearings, finger-beaters, &c.

The present plant has a nominal capacity of eighteen sacks per hour, but the demand for the flour produced by it is increasing so enormously that Messrs. Cranfield are already considering the extension to thirty sacks, the mill being so arranged that additional machines can be put in

NOVA SCOTIA

Offers advantages to British Agriculturists with moderate capital. Improved Farms at Low Rates. Fertile Lands: Famous Fruits. Enormous mineral deposits of Coal, Gold, Silver, Iron, Copper, Lead and Tin. Climate temperate and healthy. Easily accessible to all the principal markets.—Full information supplied by the Agent-General for Nova Scotia, Mr. JOHN HOWARD, 57A, Pall Mall, London, S.W.

MOST EASTERLY NURSERY

As a FENCING EXPERT AND GROWER of no small reputation, I should like to arrest your attention for a few minutes, provided you are requiring a fence of some description. I have an enormous stock of HEDGING PLANTS of all sorts, grown on my Nurseries, on England's cheapest Coast, which are open to every wind which blows, with a consequence that my large and varied stock is as hardy as it can be, and will thrive anywhere. A DESCRIPTIVE PAMPHLET containing full CULTURAL DIRECTIONS FOR HEDGING and description of Myrobelia, &c., will be sent on request. It makes a close, thorny, impenetrable fence and is non-injurious to stock. 13-2 ft., 2-100, 30/-; 1,000/-; 2-3 ft., 7/6 100, 20/-; 1,000/-; 3-4 ft., 10/- 100, 70/- 1,000. PRIVET (COMMON), 1-1 ft., 5/- 100, 35/-; 1,000/-; 2-3 ft., 8/- 100, 55/-; 1,000. PRIVET OVAL, 1-1 ft., 6/- 100, 45/-; 1,000/-; 11-2 ft., 10/- 100, 75/-; 1,000. THORN, 1 ft., 2/6 100, 25/-; 1,000/-; 11 ft., 5/- 100, 30/-; 1,000. LAURELS, BEECH, HOLLY, YEW, &c., in all sizes. Prices on application.

STARTLING OFFER.

I will pay carriage on all 5/- and larger orders to your nearest station. Distance and weight is no object. Send for Catalogue of FOREST, FRUIT TREES, SHRUBS, ROSES, PLANTS, BULBS, &c.; all sorts and any quantity supplied.

E. GAYE OULTON BROAD NURSERIES LOWESTOFT.

temperature with occasional showers, especially at night, so that the corn crops are an average, and in most places more than the average. The turnip crop is more than an average; the potato crop fully an average, but the average is less than in previous years. The digging of late potatoes for pitting is now in progress, and the weather so far has been favourable.

Durham

(North-East). THIS season must be characterised as a good one. Both barley and wheat were above the average, but oats in many cases were a poor crop. The weather during August and September was most favourable for harvest operations, but at the same time both root crops and grass suffered by the want of rain. Since October came in, however, we have had some nice showers, and, if this kind of weather continues, the turnips in this locality will turn out a very satisfactory crop. Early potatoes are blankly and decidedly under the average, but the later sorts are apparently much better. The cur-

rent price so far is very disappointing, but all growers anticipate a rise as soon as the lifting is over. Sheep continue to sell well, but, in sympathy with the fat stock market, there is a slack demand for cattle. Good horses of all kinds are in demand, but undersized and inferior animals are scarcely saleable.

Montgomery.

WE are now busy getting up roots. Potatoes, on the whole, are a fair crop; mangels fairly good, but the bulk of the turnips are badly mildewed, otherwise they are a good crop. There are very few fields of roots not mildewed. Ploughing is now going on apace. Beef and stores are very low, and trade is slack. Sheep are going pretty well. Not much threshing has yet been done. We had a glorious corn harvest, and I think there will be a good sample of grain. There is not much keep on the pastures, and stock will soon require something in addition to what they get on them. I hear of very few farms being to let this year in this locality. There is no interest

whatever taken here in the Land Tenure Bill, but it is rather different with the Education Bill. All local shows have finished, and all through the season they were very successful.

Worcester.

FARM prospects are certainly brighter. After a cold, wet spring we expected a bad season, but the cold spring was followed by a warm and beautiful summer, so that corn crops improved rapidly. Both hay and corn have been gathered in in splendid condition. Wheat is well above an average crop and of grand quality. Barley an average crop and very bright, but a little thin in the grain owing to dry weather. Oats, beans, and peas are good crops. Hay was a light crop, and one drawback to the season has been the shortness of grass, which has made cow stock very low in price. Cattle bought in to graze in the spring are worth very little more after the summer's keep. During the last month roots have been at a stand still for want of moisture and must be a small crop, but in spite of this, sheep of all kinds are dear.

Dear Sir,

Will you kindly send me a dozen

Copies

of your Annual.

What would you charge us
for 16.2000 of same?

We must say that there is
an immense lot of most valuable
information in yr. Anl. not only for
farmers but everyone connected with
Agriculture if they will only look for it.

Yours truly

M. M. M. M. M.

Fruit has been very partial, except apples, which seem fairly plentiful.

East Yorks. It has been a fine autumn and a good time for wheat sowing, about half of which is sown. In this immediate neighbourhood we have never really suffered from drought, for all the summer nearly we had showers when needed; grass and seed pastures held out well. Roots also are looking well, slightly mildewed, but are growing now and will take a good lot of consuming. Breeding and fat sheep have sold well and are selling well, but beef has been a bad trade all the way along. Beasts are a necessity to tread straw into manure on our arable farms, but feeding them is no profit at present prices. Corn was got in in good condition, and is yielding fairly, not extravagantly, and we have had better quality samples to show than in some other seasons. Prices are low, as usual, but that we nearly always expect. We had a good harvest; corn was good to cut, and the weather fine, except some farms where the hailstorm in mid-August caught us; incredible damage was done to crops, some oats and barley only yielding 1 qr. per acre, and oats worse still, all being practically thrashed out of them. Roots were injured, but have recovered a good deal.

North Lincolnshire. Incessant rain has stopped all potato gathering for the time, but has done good otherwise. It is also cold, so I hope the disease will not spread. Last week it was so hot and moist that Dates easily succumbed to the blight, and crops clean before are now struck to the extent of one-fourth of the tubers. It is a great pity, as quality and shape never were better. The supply will not cease, as German stuff can fill up the gap, and in the meanwhile I shall pay the rates and taxes (for them). The sheep are all in their winter quarters in the turnip folds, and are doing well: the lung worm, "Strongylus filaria," has been somewhat rampant, carrying off thirty to fifty in some flocks, and less in others. The balls of worms, like threads, were never larger, and lambs must be unusually strong or more must have been carried off. Threshings go on apace, barley doing well, but on wold land bad reports are given of wheat yields. One would have thought a dry season would have suited it thoroughly.

Shropshire. AFTER the long dry weather which has greatly improved the grass is very short. Although it has been so dry, the mangolds are an average crop; turnips a fair crop, but very inferior quality owing to the drought. Potatoes very very much; some crops very good, others poor ones. The early part of the harvest was rather unfavourable, but the latter part was exceptionally good. The crops as a rule fairly good; the hay being a fair crop and well harvested. The corn yields very well, but prices are low. Beef continues very low; so do store cattle and milch cows. Sheep are doing well, and are well sold; so also are pigs. Cheese-making is most profitable for farmers; this season the prices are unusually good.

Mid-Cumberland and North West-merland. THE season is now sufficiently far advanced to enable all parties connected with farming or interested in agriculture to form an approximate estimate of the general effects it has on the welfare of agriculture in the several districts where they reside, especially as it has been so extremely favourable for securing all kinds of produce in a condition fit to put upon the consuming markets, and thereby testing both quantity and quality. First, the hay crop proved much above an average, and the bulk of it was secured in prime condition with the minimum amount of labour, therefore at the least cost. The oat crop (the principal cereal grown) has proved somewhat irregular, and upon the whole slightly below average; it too has been secured in good condition and fit to put on the market, but the owners of steam thrashers universally complain that the yield is disappointing and the quality inferior. The price, too, is low, only 20s. for the best samples of 26 stone to the quarter. The bulk of the potato crop has also been lifted in fine condition, but the result is very disappointing, being little if any more than half a crop of marketable value. In many cases fully half the crop is only fit for pigs or seed. Turnips, on the other hand, are quite a record crop, while still growing over most of the heavy land for which the month of May was so very unfavourable, and will make quite an average. As regards stock, we have had a splendid summer for grass, and sheep of all ages and breeds have paid remarkably well, but cattle with the excep-

tion of dairy sorts have in many cases left little for fattening, and the price of stores, which are bound to follow prices of beef, are equally unsatisfactory, in many cases making little more than spring prices. Lamb and mutton on this contrary have and are still making good prices, especially the former. In fact, sheep have proved the sheet-anchor of farmers this season.

Essex. SOMETIMES it is said that farmers always grumble, but I hardly think there is much cause for grumbling this year, nor do I think it is much indulged in just now. We have had a glorious summer and autumn, and although our hay crop was very light, the corn crop has been decidedly good, and harvested under the best of conditions. In many instances the harvest operations were completed in nineteen days. And I have heard of as much as fifty-four bushels of Minhead wheat being threshed to the acre. It is difficult to say which is the best crop of the season, for peas and beans, as well as the white straw crop, have done well. After the dry summer the land breaks well, and a good portion of the autumn sowing is already completed, the seed having gone into an excellent seed-bed. The only thing to complain of this year is the price at which we have to sell our corn. Except for special samples of malting barley there is very little difference in the price per stone of all home-grown corn. Wheat, barley, oats, peas, and beans make just about 9½d. per stone. When shall we as farmers sell and buy all our corn at a uniform weight? Stock, too, have done well this year, sheep and pigs being a specially good trade. It is a pleasure to be able to write so good a report, and may we have many such seasons.

Horse breeders who have not got a remedy that they swear by (to use a well-known expression) when their horses get a wound or a strain should give Pond's remedy a trial, for it is a safe and speedy cure, as many will testify. It checks hemorrhage, contracts the skin, heals it, and destroys germs and pimples, the severest wound of not only horses, but also cattle, dogs, and other domestic animals. A pamphlet giving full details can be had on application to the manufacturers, Pond's Extract Co., 65, Great Russell Street, London, W.C.

In writing to advertisers, readers will confer a favour by mentioning the "Mark Lane Express" as the source of their information.

"HAMPEL" MANURE DISTRIBUTOR

Can be used for sowing Basic Slag, Superphosphates, Kainit, Ground Lime, Bones, and all kinds of Artificial Manure.

The advantages are Equal Distribution, Lightness of Draught, Simplicity of Construction,

thereby requiring little repairing and ensuring easy cleaning and capability of adjustment for sowing all kinds of manures.

The handling is very simple, no other assistance being required beyond that of the driver, and one horse will pull it with perfect ease.

No. 3 Sowing 8 ft. wide. £11

No. 4 Sowing 6 ft. wide. £10

If with arrangement to transfer wheels from cuds to sides for narrow lanes and gateways, £1 extra.

Landlords at Rent Audits. IN reading an account of the late Lord Cranbrook, who passed away at the ripe old age of ninety-two, we learn that up to about two years ago he made a point of always meeting his tenants at their annual rent audit. Only on two occasions did he miss; one was when he had important duties to perform in the House of Commons, and the other followed the death of Lady Cranbrook. This is just how it should be, and we wish that there were more landlords who followed the example of the late earl, whose name was a household word amongst Kentish agriculturists. It is quite right and proper that the business of an estate should be conducted through an agent, but once a year, at any rate, the tenants should have the privilege of meeting their landlord, and what better occasion could there be than the rent audit? In more than one case we fear the acquaintanceship of the tenantry with the landlord is an occasional sight of him—perhaps at a distance, and this is not the kind of thing that is qualified to cement a bond of fellowship between the two which is to the mutual interest of both parties.

Fowls and Foxes. A LEOPARD cannot change his spots, and no amount of persuasion on the part of fox hunters will make poultry-keepers treat Reynard as being anything but a thief and a robber. Just as stolen fruit is said to be the sweetest, Reynard seems to enjoy the food he gets by thieving better than that which he obtains in a legitimate manner, and the worst point about him is that he generally kills more than he can eat. Fasten your fowls up at night, is the advice given by the fox-hunter, but we fail to see what solace he would offer to the man who recently adopted this precaution, but let the poultry out in the morning, and had a score of birds killed by Reynard while he was in the house at breakfast. We think the poultry fund of the hunt ought to pay up rather handsomely in a case of this kind. No one can be better acquainted with the anxieties of the man who would keep poultry in a fox-hunting district than the individual himself, and if he goes very long without a loss he may consider himself fortunate. It may be interesting to some readers who have suffered loss to know that one of Reynard's pet aversions is fresh tar, and it is said that if poultry houses are frequently painted with this foxes will give them a wide berth.

Legislation and Stray Dogs. TO say that Parliament is doing nothing for agriculture is wrong, for it is attending to various small matters, and in the New Year the new Dogs' Act will come into operation, which measure has for one of its objects the prevention of sheep worry-

ing and other troubles by stray dogs. But what is a stray dog? that is the question. If you happen to put a few pellets into a quadruped of a mongrel-looking character, that appears to be abroad ownerless and homeless, it is quite likely that an owner will turn up, a pedigree be produced, and you will find yourself in a county court defending an action for damages. Just so; but the new Act will enable local authorities to make regulations for preventing dogs straying at large during the hours of darkness, and the same authorities will have power to enforce a law which will make it compulsory for dogs in highways and public places to wear a collar bearing the name and address of the owner, except in the case of packs of hounds, sporting, and sheep dogs. We hope this measure will serve a useful purpose in doing away with the stray dog nuisance, for though we know that an animal which has been properly looked after will occasionally betray worrying tendencies, it is the wandering mongrel who is no good to anybody that is generally responsible for the mischief.

Eggs. NOW is the season when the man who is told at his hotel that he can have fresh eggs for breakfast without the slightest trouble looks somewhat suspicious at them when they appear, and wonders whether the freshness is supposed to apply to the present or the past. The reason for doubt is of course obvious, for at the present moment poultry-keepers are rejoicing on the one hand at the prices obtained, and regretting on the other that they cannot produce more eggs. They may of course forget that if fowls were laying better prices would not be so high, but these matters of logic are apt to be over-looked when eggs are fetching 2d. each. The man in the street who consumes his one egg for breakfast every morning as a matter of rule wishes that the supply could be regulated a bit more evenly. It is peculiar of him that his appetite for new-laid eggs is not so keen when they are at their cheapest, and when they get to be 2d. each he enjoys his fresh egg but has doubts in his mind whether he is getting value for money. "Why can't the poultry-keepers contrive to produce fewer eggs in the summer and more in the winter?" he argues. Just so; we happen to know a few poultry keepers at the present moment who would like to find out the secret of doing this. We do not think they would be likely to cry it from the house-tops.

Market Dinners. WHAT an institution the market dinner used to be! and how in these days its glory has departed, we would also add, perhaps for the better. Still, we think of the mid-

day meal at the leading hostelry in the market town, where the head of the table was occupied by a leading light in the local agricultural world, and the farmers from round about dropped into their places round the board in a natural manner that was the outcome of long custom. What they ate and what they drank does not concern us here, but in business they were a race of substantial men with capital behind them, and when they met once a week at the market dinner it was a pleasure to see the good fellowship that existed between them. Perhaps some of them sat longer and later than was good for them, because market dinners, like other things were then, as now, open to abuse, but that, as Kipling would say, is another story. The market dinner and similar gatherings flourished in the days before the doctrines of co-operation and combination were preached, but we think, nevertheless, that there was in many respects a stronger bond of unity amongst farmers than exists now.

Planting Orchard Fruit Trees. IN every district where apples will grow we look upon an orchard as being a valuable adjunct to any farmstead, and the present is a good time for planting trees for making new orchards and renovating old ones. Both landlords and tenants should be interested in orchards, for the former in supplying trees improves his property, and the latter, if he looks after them, reaps the benefit of the fruit. Fruit nurseries are now so plentiful that there is no difficulty in getting good trees of the best varieties at a reasonable price, and before planting a good hole should be got out and the soil be well broken up. It has been proved by experiment that orchard trees make better headway if the turf is not allowed to grow up to the stems for a few years after planting, and farmers will do well to bear this in mind. Another thing is to properly stake the newly-planted tree until it has got a firm hold on the soil, and if it is planted in an orchard where cattle is grazed, proper means should be adopted for protecting it. Indeed, through the neglect of these matters, many pounds spent on fruit trees have been literally thrown away.

Rooks and Seeds. THROU' all generations of agriculture rooks have betrayed the same tendency to fetch the seeds out of the ground that the farmer has put in, and they show no signs of improving their ways in this respect. In the old days we used to employ lads with spears to protect the crops, and "rook tending" was a means of bringing a little grit to the agricultural labourer's mill. But now an all-wise conservation system, which does not seem to reach at all different

requirements of rural and urban districts, decrees that lads are better employed at school than rook-tending. They may be in a way, but the mother would be glad of the few shillings they would earn, and the farmer would quickly avail himself of this means of protecting his crops. But seeds have to be protected, even though the boys must not be kept from school to do it, and in our issue of October 22, page 475, a recipe was given for treating seed so that rooks will not touch it. Knowing how some of our readers suffer in districts where rooks are, perhaps, more plentiful than they ought to be in the interests of agriculture, we have ventured to draw particular attention to this matter.

The Pig Trade.

It is characteristic of the pig trade that it is always either right up or right down. Just now it is up, or at least prices are, and there is a general desire to go in for pigs. Quite so, but the scarcity of pigs applies also to breeding sows, which are a

scarce commodity just now, and sows will have to be bred before pigs will be very plentiful, consequently pork is likely to be dear for some time to come. It is said that the Chicago meat scandals are responsible for the high price of pork and bacon, which in a measure may be correct, but scarcity of pigs has more to do with it than anything. In the old days it was almost necessary to keep pigs on dairy farms to consume the bye products for cheese and butter making, but now that the milk goes away everything goes, and when pigs were down many farmers did not need much persuading to give up keeping them. The people who have done and are doing the best out of the pork boom, are those who did not follow in the sheep-like procession which is characteristic of pig breeders, but went in strong for them when everybody else was leaving off. It is possible that the scale will turn again in time when the stock of pigs has been worked up, and however this may affect breeders, the man in the street would like to get his morning fasher of bacon a little cheaper.

permit of the compulsory acquisition of land alike for allotments, small holdings, and housing, a Bill which will permit of the expropriation of landlords under more drastic conditions than Mr. Jesse Collings anticipates, and which will permit of the State's financial resources being utilised for this purpose under the distinct authority of a central organised body. As a fact, these Parliamentarians—it is no use glossing over this—think infinitely more of the possibility of such a measure than they do of the Land Tenure Bill. Indeed, the mere fact that in one instance the Bill carries out the very design of Mr. Walter Long, and that it would realise certain suggestions of a committee of which Mr. Chaplin was a powerful member, is to them a source of suspicion. What good can come out of Nazareth? To them none.

The Real Fight of this Parliament.

Of course, knowledge of this temper in the party is the real explanation of the vigorous attack—nay, embittered attack—which Mr. Balfour delivered upon the Scottish Land Bill. The leader of the Opposition knows perfectly well that the anxiety of these Radicals is that this Bill should be made the bases of a measure applying to the United Kingdom. Hence his description of it as "highway robbery." Hence his comparison of its purpose to that of "the gentleman in the street who relieves me of my purse," and, what is more, to a robber who had not the capacity of rightly using what he had pilfered. Frankly, this strenuousness of phrase is quite in harmony with the temper of the party. Toryism has in all its shades revealed that it regards this Scottish Bill as the unclean thing, and the very ardour of this antipathy has served to deepen the appreciation of the Radicals. They have become ecstatic over the proposals of this Bill—every discord of the Tories is followed by a hymned psalm from the Radicals. What do I deduce from this? Why, that when the Government has thrown a sufficiency of sops to the Socialist Cerebus, it will have to set itself, nilly willy, to the grim land problem. I verily believe that when the history of this Government is written, its attempt to solve the Ministry-wrecking problems of the land will be its outstanding story. And, methinks, it may not unlikely provide its epitaph. At all events, Mr. Balfour has plainly shown that the tussle will not be one of rose water. It is to be one of close grip, and the Tory David has the solace that, if petty of stature, he has the citadel of the Lords behind him.

The Trend of the Radical Mind.

"The farmers are more Protectionist than ever." This was the verdict of a Liberal Member of Parliament who had epitomised for me the sugar-beet debate at the Central Chambers. "This Protectionist sympathy was," said he, "not hinted at in a future manner. It was boldly proclaimed. Well, they will go their own gait, of course. But let me ask how they can hope to get assistance for their project with the Radicals in power, when they deliberately associate with it a frank suggestion for a Protectionist policy." How far this description of the debate is justifiable I know not. I thought, however, this conversation was worth reproducing as a revelation of the trend and thought of the Radical mind.

Sir Francis Channing.

Of course, the chief interest in the King's birthday list from an agrarian point of view centres in the baronetcy bestowed upon Sir F. A. Channing. Of course, there be some men who perceive in the distinction a solace for the inability of the Premier to include Sir Francis in his Ministry. I prefer to perceive in it a frank and generous anxiety to recognise Sir Francis's laudable zeal in the interest of co-operation and agricultural reform. No man on the Liberal benches—no, not even Mr. George Lambert—has revealed so unceasing, so vigilant, and so keenly-alert an anxiety to embody the three F's in agrarian legislation. No man on the Liberal benches has so clear and so sagacious a comprehension of the bases on which a scheme of small holdings should be reared. No man on those benches has revealed so direct an appreciation of the Danish co-operative system of culture, and how it might—with its educational prefaces—be grafted on to the existing tradition-laden British system. No Liberal politician has shown so clear-eyed a comprehension of the wiser lines on which the resources of the State should be utilised

Agricultural Politics.

BY A LOBBYIST.

Two Facts in the Tenure Debate.

I am not going to enter into all the infinitesimal incidents—I had almost written incoherences—of the debate upon the Land Tenure Bill. Two facts stand out eminent from my memory of the voluble proceedings. The first is that the mind of a certain type of politician is to-day as resolutely opposed to even a moderate tenure reform as it was in the days of the Farmers' Alliance. The second fact is that there is a strong body of Liberals who find it impossible to nerve themselves into rhapsodical enthusiasm over the measure. As a fact, this Bill has served to again indicate with that old-time clearness and precision which had been somewhat obscured the definite line of cleavage between the two parties in reference to tenure reform. Indeed, it has been protruded into a greater distinction than at any period since the vivid days of the anti-Game Law agitation. We have had the perverted language of the arch-protagonist of that movement, John Bright himself, repeated in less diletto tones than that orator employed. It is this which explains why a certain Liberal apathy and indifference is allied with the progress of the Bill. Indeed, the Conservative antagonism to the measure has been in itself as the goading-spur to the party. The Radical cheers and the Radical majorities have been provoked, not by the inherent virtues of the measure—indeed, by but a score of Liberals, who rather reflect the Whig tradition than the present Radical assertiveness and anti-landlordism, men, I mean, of the Whitbread and Nussey type, the Bill is regarded as tepid and fireless—but by the joy of battle and the desire to rout their foes.

A Word to the Antagonists.

Now, just a word to the antagonists of the measure. And here let me say that certain of those antagonists—I am speaking of the younger men like Lord Turnour and Lord Helmsley, who, of course, have had the great advantage of being buttressed by the remarkable intellectualism of Lord Robert Cecil—have revealed what I must fain describe as a sardonic vivacity, which is an acceptable portent of the future debating ability of the Conservative party. In these immature young men we have the clever and responsible future leaders of the party. We have had vouchsafed a vision of a future dialectical agility which may well induce the Liberal lenders to cogitation and foreboding. All the same, it is well not to overdo the part of antagonism. It is well, of course, sometimes to assume the cap and bells, but it is not well to be the hoisterous Merry Andrew. Just in the same way it is well to use adjectives; but it is not well to make them too rumbustious. To call the original provisions of the Bill in regard to game "sheer robbery" is to be guilty of that supercogitation which is nigh unto bathos. There are many of us who would desire to limit the compensation for damage done by game to the actual harm wrought by the birds reared on the estate of the landlords, but it is not necessary because of the Ministerial attitude to indulge in an excessiveness of phraseology which is perilously like levity. There are some of us,

too, who believe in the more definite inclusion in the Bill of the principle of worstment—who believe that if the tenant should be able to claim compensation for his improvement, so the landlord should be able to claim damages for depreciation of the holding by either improper cultivation or neglect; but because the Ministers

SIR FRANCIS A. CHANNING, Bart., M.P., who figured in His Majesty's Birthday Honours list.

have not thought it wise to accept the suggestion and prefer to leave the matter to the arbitrator, it is not necessary to speak of their conduct as "wicked, cruel, dastardly confiscation." As a fact, a measure which has received in its general purpose so wide an acceptance from agricultural bodies cannot possess these moral obliquities. These bodies are both Conservative and conservative—they have a severe sense of the just rights of landlords; and assuredly they would not throw the regis of their appreciation over a measure having this character.

What the Pesterers Want.

Of course, there is a great belief among the Parliamentarians of the Commons that the Bill will be either rejected by the Lords or so emasculated as to be worthless—that is, worthless from their point of view. They believe what I may describe as the Turnour-Rutherford-Banbury position adopted in the Commons—the position, in a word, that the Bill is unnecessary and vicious, and will be provocative of danger to the personal relations of landlord and tenant—will be either accepted or emphasised and accentuated. It is this which explains the restlessness of the Liberal rural M.P.'s, and their desire to exact from Sir Henry Campbell-Bannerman binding pledges as to future legislation. It is this which explains the persistent pesterings of deputations and individual members. They want not a mere Tenure Bill. They want a Bill of which tenure shall be but a phase and an incident—a Bill which will

in the establishment of yeoman proprietors on the soil. His Tenure Bill, too, is an admirable expression of his conceptions and desires. Better drafted than the Robartes' measure, it is a better reflection of the real anxiety of the Liberal tenure-reformists. His Small Holdings Bill is the most articulate and sensible expression of the Liberal purpose, and has associated with it a cogent reflection of the new baronet's Danish-cum-co-operative ideals. I welcome this honour, apart from the academic and inherited distinctions of Sir Francis, because the recipient has deliberately made his chief Parliamentary anxiety the modernisation of tenure laws and the recalling of fertility to waste, and needlessly fallow land. We may not all agree with Sir Francis's methods. We must assuredly admire the man and his aim

AGRICULTURAL LAW.

Advice of a Legal character is offered to Readers entirely free of charge. Particulars of cases should be addressed to the Editor, "MARK LANE EXPRESS," 3, Wellington Street, Strand, London, W.C.

A Horse Accident.

Sir,—The day of the plaintiff, with horses arranged as aforesaid, occupied practically the whole usable road, and my servant, to get by at all with his horse and cart, must necessarily pass within a few inches of the plaintiff's horse on the off side, which projected quite 2 ft. wider than the road. At the moment of passing, this horse swerved suddenly to the right, and my cart wheel grazed the said horse's front pastern, slightly breaking the skin only, and that not sufficiently to cause bleeding; the horse walked lame afterwards, chiefly because he was very lame previously, but fortunately on the hind leg (near side), which was not touched at all by my cart.

I have an independent witness who saw and can swear to the above facts.

Now would "Barrister-at-Law" advise me to fight the case? R.

[*.* No, I would not, because, admitting that the day was a wide one, it still had the right to use the road; in other words, it was lawfully proceeding along the road. Now, your cart prepares to pass it, and in doing so your driver passes on his off side at his own risk; the swerving of his horse caused the accident—that was not an unexpected thing. I am still of the same opinion on the facts, but the damage claimed may appear excessive, and if you want to fight employ a smart solicitor and take your chance.—BARRISTER-AT-LAW.]

The Farmers' Club.

The Farmers' Club met at the Whitehall Rooms, Hotel Metropole, London, on Monday, under the chairmanship of Mr. F. E. Muntz, and there was a large attendance to hear Mr. J. McLaren's paper on "Farming Implements in Relation to Labour—a Retrospect." A résumé of this paper appeared in our last issue, so need not be touched upon here.

Mr. F. S. Courtney, in proposing a vote of thanks to Mr. McLaren, which was carried unanimously, spoke of electricity as being the ideal power for farm work, if the question of cost could be satisfactorily solved.

Mr. H. Hailey, in seconding, hoped that the Royal Society would encourage further invention in agricultural implements, which would have the effect of saving labour, now the most important item in carrying on farm work.

Mr. Christian urged that piece-work was more economical for the master and productive of more contentment to the men, and he thought the masters might do something to improve the outlook for the ordinary village labourer. The curse of agriculture, however, was partly politics. If they would sink party and go solidly for agriculture they would cease to be "the shuttlecock of both political parties."

Mr. Latham agreed with Mr. McLaren that the use of machinery of the right sort would prove the salvation of their industry.

Mr. Amos thought yearly tenants with their insecure tenure would find it dangerous to instal fixed machinery.

The Chairman said his experience went to show that the advantage in the use of machinery very much depends upon the men who work it. He suggested that co-operation among farmers would enable machinery to be more largely employed.

In acknowledging a vote of thanks, Mr. McLaren suggested that the Royal Agricultural would stimulate invention by offering prizes for machines that would perform operations on the farm at present done by hand.

ROYAL AGRICULTURAL SOCIETY

Park Royal Surplus—Harewood House Still Unsold—Date of Lincoln Show—No Increase in Prize Money—Farm Prizes.

The monthly council meeting was held on Wednesday, Mr. F. S. W. Cornwallis (president) in the chair.

Present.—Trustees: The Earl of Coventry, Lord Middleton, Lord Moreton. Vice-Presidents: H.R.H. Prince Christian, K.G., Mr. J. Bowen-Jones, the Right Hon. Victor Cavendish, M.P., Mr. Percy Crutchley, Mr. J. Marshall Dugdale, the Earl of Northbrook, the Hon. C. T. Parker. Other Members of the Council: Mr. George Adams, Mr. Charles R. W. Adano, Mr. T. L. Aveling, Mr. John Barker, M.P., Mr. T. A. Buttar, Mr. R. G. Carden, Mr. Richardson Carr, Sir Richard P. Cooper, Bart., Lieut.-Col. J. F. Curtis-Hayward, Sir H. F. de Trafford, Bart., Mr. H. Dudding, Mr. J. T. C. Eadio, Mr. James Falconer, Mr. R. Forrest, Mr. J. W. Glover, Sir Gilbert Greenall, Bart., Mr. R. Neville Gronville, Mr. J. Harris, Mr. W. Harrison, Mr. A. Hiscock, jun., Mr. B. W. Hobbs, Mr. J. Howard Howard, Sir Charles V. Knightley, Bart., Mr. Ernest Mathews, Mr. W. A. May, Mr. C. Middleton, Mr. T. S. Minton, Mr. Ralph Palmer, Mr. C. M. S. Pilkington, Mr. G. G. Rea, Mr. F. Reynard, Mr. John Rowell, Mr. E. W. Shackle, Mr. R. Stratton, Mr. H. Tallent, Mr. George Taylor, Mr. A. P. Turner, Mr. E. V. V. Wheeler, and Mr. C. W. Wilson. The following members of the Lincoln Local Committee were also present:—The Mayor of Lincoln (Mr. A. C. Newsum), Mr. A. H. Clark, Mr. C. W. Pennell, Colonel J. S. Ruston, Mr. C. W. Tindall, and Mr. E. E. Tweed (local secretary).

The President said that before proceeding with the business on the agenda, he very deeply regretted to have to inform the council that a letter had been received from Sir Nigel Kingscote to the effect that, by his doctor's orders, he had been compelled to resign active work on the council of the society.

Mr. Cornwallis moved, H.R.H. Prince Christian seconded, a resolution recording Sir Nigel's services on the council, which was adopted unanimously.

Finance: Park Royal.

Mr. Adeane (chairman) reported that the balances at the bank on July 31, 1906, were:—Reserve fund, £2,924 1s.; ordinary account, £18,415 18s. The total receipts for the period had been £5,295 12s. 11d., and the expenditure £19,120 11s. 4d. The balances then standing to the credit of the Society's accounts were:—Reserve fund, £3,123 15s., and the ordinary account, £4,391 5s. 3d., making a total credit balance of £7,515 0s. 3d. Accounts amounting in all to £1,050 12s. 11d. had been passed and recommended for payment.

The secretary had submitted a statement showing the result of the sale of Park Royal estate, from which it appeared that there would be a surplus of upwards of £5,000 after the liquidation of Park Royal, Limited. The committee had considered a request from the Lincolnshire Agricultural Society that members of that society paying an annual subscription of 10s. should be granted free admission to the showyard on the occasion of the Society's Show being held at Lincoln next year, and recommended that this privilege be granted to such of the members of the Lincolnshire Agricultural Society whose subscription of 10s. had been paid for the year 1907.

Mr. Adeane, in moving this report, said:—With reference to the sale of Park Royal, he would like to state that after the meeting of the council there would be a general meeting of Park Royal, Limited, to confirm the appointment of Mr. Bond, of Welton, Jones, and Co., the society's professional accountants, as the liquidator. He hoped that the company would be liquidated and finally disposed of by the end of the year, and that it would be possible to present a final report to the council early in the New Year. He might say that the balance, £5,398, has been placed on deposit at the bank as authorised by the council.

The report of the Finance Committee was then adopted.

Harewood House Still Unsold.

The President observed that, before going on with the report of the House Committee, he had a word or two to say to the council. At the last meeting authority had been given to fix the society's seal to the building agreement of Harewood House, but he regretted to inform the council that at the end of September, when the date for the completion of the negotiations became due, the syndicate withdrew their offer. He thought it was only fair to say that there was not the slightest blame to be attached to anyone engaged in the negotiations on their side. The necessary preliminaries had taken some time, then the holidays intervened, and it was a matter of im-

possibility to get to close quarters with the business at an early date. Since the offer had been withdrawn, steps had been taken to secure fresh purchasers, and with a valuable property like Harewood House fresh offers would be forth-coming. The council, he was sure, would not wish to enter closely into the matter at this moment, and he would venture to suggest that the House and Finance Committees should be asked to continue the negotiations for a sale or lease of Harewood House on the terms already approved by the council.

General Lincoln.

Mr. Cornwallis reported that the General Lincoln Committee had been constituted of the whole council, together with the following members of the Local Committee:—The Mayor of Lincoln (Mr. A. C. Newsum), Mr. W. T. Page, jun., Colonel J. S. Ruston, Mr. Edgar Lubbock, Mr. C. W. Tindall, Mr. A. H. Clark, Mr. C. W. Pennell, and Mr. E. Tweed (local secretary).

The Dates of the Show.

The committee recommended that the Lincoln Show should open on the morning of Tuesday, June 25, and close on Saturday, June 29. The prices of admission to the showyard to be as follows:—Tuesday, June 25, admission 5s.; Wednesday, June 26, admission 2s. 6d.; Thursday, June 27, admission 2s. 6d.; Friday, June 28, admission 1s.; Saturday, June 29, admission 1s.

Railway Fares to Shows.

Letters had been read from the Federation of Lancashire Agricultural Societies asking for the co-operation of this society in their endeavour to obtain the privileges of reduced railway fares for all exhibitors and officials attending shows, and in connection with which the Federation had decided to present a petition to the Railway Clearing House. The committee were in sympathy with the action taken by the Federation in this matter, and recommended that a letter from this society be addressed to the Railway Clearing House advocating the appeal for reduced fares, as set forth in the petition of the Federation.

Stock Prizes, £4,000 or £4,600?

Mr. Reynard (chairman) reported that the committee had prepared a draft prize-sheet, which they recommended should be printed and circulated amongst the council for their consideration in anticipation of the final settlement of the prize-sheets at the December meeting. They recommended that the sum of £4,600 be placed at their disposal for providing prizes for live stock, poultry, produce, &c., at the Lincoln Show of 1907. The Committee recommended that the entry fees in the horse classes, including all the charges for stabling, should be as follows:—

	Members.	Non-members.
For stallions and brood mares	40s.	80s.
For stallions and brood mares, post entries	50s.	100s.
For other horses in breeding classes	30s.	60s.
For other horses in breeding classes, post entries	40s.	80s.
Riding and driving classes	30s.	60s.
Pace and action and jumping classes	30s.	30s.

Also that the dates of closing of entries be as follows:—

Horses, cattle, sheep, and pigs:—	
At ordinary rates	May 14th
At post entries	May 28th
Riding, driving, pace and action, and jumping classes	May 28th
Poultry at ordinary rates	May 28th
Produce at ordinary rates	May 14th
Produce at post entries (except cider and perry)	May 28th

A letter had been received from the Secretary of the Lincoln Local Committee, intimating that they had generously granted the sum of £200 towards the Society's Prize Fund for the Lincoln Show. The Lincolnshire Agricultural Society have offered £134 for special prizes to be awarded to members of the Lincolnshire Agricultural Society in the open classes. Various offers of champion and other prizes by Breed Societies have been received, and the Committee recommended their acceptance with thanks.

Mr. Reynard, in presenting the report, said that the proceedings at the conference on the Lincoln breeding industry in this country would be of a practical nature, but he hoped that some good might result from the conference. The council would notice that the Stock Prizes Committee were asking for a grant of £4,600, which was £600 in excess of what was granted to them last year. The committee had most carefully gone into the pre-

posals, and considering the very handsome additions from the Lincolnshire Local Committee (£900), the Lincolnshire Agricultural Society (£134), and from the various Breed Societies, they found it necessary to endeavour to enlarge their prize list for all classes of stock. He would like to point out that although £4,000 was voted last year for their prize-list, they had received £4,120, so that this addition was the small one of £180 in excess of what had been received last year. He therefore trusted that the Council would see well to vote this amount, as it was hoped that the extra prize-money would attract more exhibitors, and make the Royal prize-sheet what it ought to be. With regard to the reduction of fees for horses, there had been very great complaints of late years that they had been too high. There had been a separate charge for the entry-fee and a separate charge for stabling, but now it had been reduced, and the entry-fee included the charge for stabling.

Mr. Parker said that it seemed to him that this was the old battle being started between the Finance and the Stock Prize Committees. If they had a Finance Committee, why not be guided by them? He was of opinion that they should support the Finance Committee and adhere to what they said.

Mr. Wilson appreciated very much the guarded way in which the chairman of the Finance Committee had brought forward his report. He thought their object was to make the show as good as possible, and he believed that it would not be money thrown away.

Mr. Stratton would like to say one word before the report was put to the meeting. He had been unable to attend the Stock Prizes Committee on the previous day, but had been there he should certainly have opposed the proposition which had been made. Considering the financial position of the society, the action which had been taken with regard to the Special Committee, and the paramount importance of endeavouring to impress upon everybody the necessity for economy, he did think it was premature to increase the amount of the prizes.

Mr. Rowell remarked that, seeing the very handsome way in which the Breed Societies had met them, and the very careful way in which the Stock Prize Committee had gone through the prize list, he hoped the increase would be granted.

Mr. Palmer said that the council must make themselves secure by economy, and heartily supported Mr. Parker.

Sir Gilbert Greenall thought it would be a very false economy indeed if they were not to give a good prize-sheet. All the breed societies had met them in the most handsome way, and if they desired to retain the support of those societies, they must give proper prizes.

Mr. Harrison could not agree with the remarks made by Mr. Parker, Mr. Stratton, and Mr. Palmer. He was as great an economist as any of these gentlemen, but he thought the request of the Stock Prizes Committee was entirely in the right direction.

Amount to be Offered £4,000.

After some further discussion, it was, on a show of hands, decided by twenty-three votes to twenty-one to limit the money to be offered by the society for the year 1907 to £4,000.

The report of the Stock Prizes Committee, with this amendment, was then adopted.

Implements at Derby and Lincoln.

Mr. Bowen-Jones reported that the revised report on the trials of section gas plants at the Derby Show was being finally corrected, and would be published in the course of a few days.

The committee considered the implement prize sheet and regulations for the Lincoln Show, which, after amendment, were approved. The committee recommended that the implement shedding in the Lincoln showyard should only be allotted in multiples of 5 ft., and that no exhibitor be allowed to take less than 10 ft.

The draft regulations for the trials of swath turners and side delivery rakes were considered, and, after amendment, were approved.

Election of Council, &c.

Mr. Adeane reported that Mr. Thomas A. Buttar, of Corston, Cornwall, had been elected to fill the vacancy on the council in the Division of Scotland caused by the resignation of Sir John Gilmour, Bart. The committee had determined by ballot, in accordance with the terms of by-law 82, that the representatives on the council of the various divisions should retire as follows:—

In 1906:—Group "C," comprising the Divisions of Cumberland, Westmoreland, Yorks (East Riding), North Wales, Lincoln, Huntingdon, Cambridge, Oxford, Kent, Warwick, Gloucester, Glamorgan, Somerset, Berkshire, Sussex, and Ireland.

In 1907:—Group "B," comprising the Divisions of Durham, Yorks (West Riding), Nottingham, Leicester, Rutland, Suffolk, Buckingham, Essex, London, Shropshire, Hereford, South Wales, Devon, Wiltshire, and Surrey.

In 1908:—Group "A," comprising the Divisions of Northumberland, Yorks (North Riding), Lancashire and Isle of Man, Cheshire, Derby, Northampton, Norfolk, Bedford, Hertford, Middlesex, Stafford, Warwick, Monmouth, Cornwall, Dorset, Hampshire and Channel Islands, and Scotland.

The Committee recommended that the Annual

General Meeting of Governors and Members should be held at the Hotel Russell, on Wednesday, the 12th December, at 12.30 p.m. To fill the vacancy caused by the retirement of Sir Nigel Kingscote, the committee recommended the election of Mr. Cornwallis as a trustee. On the motion of Mr. Adeane the Council unanimously elected Mr. Cornwallis a trustee of the Society.

Mr. Cornwallis said he could not proceed without acknowledging the high compliment the Council had paid him in electing him a Trustee.

Re-Arrangement of Standing Committees.

Mr. Wheeler said that, in accordance with the motion he had given at the last meeting, he begged to move that steps be taken to reduce the number of committees of this council. Many gentlemen were on several committees, and had to go from one to another, and consequently the work had to be rushed. At present thirteen committees met on the Tuesday, and a good many of them went over the same ground, so that there was a great deal of duplication of work. He knew there were some members of the council who did not agree with what he was going to suggest, and he thought, therefore, that the best course would be to refer the matter to the Committee of Selection to carry out. He would state what his scheme was, and perhaps some of the members of the council would criticise it, so that the Selection Committee would have something to go upon. He would suggest the amalgamation of the Finance and House Committees. These two committees had had to work together in connection with the negotiations for the sale of Harewood House and other matters. He would like to see one committee to deal with the whole of the arrangements for the show. That would mean the amalgamation of the Showyard Works, Implement, Stock Prizes, and Dairy Committees. He suggested that, because at the present time all those committees were spending money upon the show, and there was no chairman who had in his mind the total amount spent on the show at one time. Then he would like to amalgamate all the scientific committees, the Chemical and Botanical, and perhaps the Veterinary might go with them, as it was a scientific committee, and in many cases it overlapped the work of the chemical and zoological departments. He would also like to see the Journal and Education Committees amalgamated under one chairman. The Selection and the General Show Committees must remain as they were.

Mr. Carr seconded the resolution.

After some discussion the President pointed out that there could be no great haste in the matter, because under by-law 38, which named almost all the committees they had at present, an alteration of the by-laws would be necessary before they could achieve very much.

Farm Prize Competitions.

Sir Gilbert Greenall reported that the following prizes, amounting to £150, had been offered by the members of the Belvoir, Brocklesby, Burton, Blankney, and South Wood Farms, for farms hunted over by these packs:—

	1st.	2nd.	3rd.	4th.
	£	£	£	£
Class I.—For farms exceeding 300 acres	40	25	10	—
Class II.—For farms not exceeding 300 acres	30	20	15	10

(Entries to close on January 1, 1907.)

Particulars of the conditions under which entries might be made could be obtained of Mr. William Frankish, secretary of the Lincolnshire Agricultural Society, St. Benedict's Square, Lincoln, to whom the entries for these two classes must be made.

A further sum of £150 had been offered as prizes for farms in Lincolnshire, and it was necessary that these matters should be dealt with immediately. If the council would agree to accept these prizes, he would move that a committee be formed to make the necessary arrangements.

Mr. Crutchley said that before the question was put he would like to point out that, so far as he could remember, the judging of farm prize competitions was a very expensive matter, and he presumed that the whole cost of the judging would fall upon the society.

Mr. Harrison explained that all the expenses of judging would be met from outside, and that the society would be put to no expense whatever.

These offers were accepted, and a committee, consisting of Sir John Thorold, Bart., Sir Gilbert Greenall, Bart., Sir Richard Cooper, Bart., and Mr. William Harrison was appointed to carry out the necessary arrangements.

Report to the Annual General Meeting.

The report of the council to the annual general meeting of Governors and members to be held at the Hotel Russell, Russell Square, W.C., at 12.30 p.m. on Wednesday, December 12, was prepared, and ordered to be issued.

Dates of Council Meetings in 1907.

It was decided, on the recommendation of the

Committee of Selection, that the council meetings of next year should be held on the following dates:—January 30, February 27, March 27, May 1, June 5 (Derby Day), July 31, November 6, and December 11.

Other business having been transacted, the council adjourned until Wednesday, December 12 next, at 11 a.m.

CENTRAL CHAMBER.

The first meeting in the winter session of the Central and Associated Chambers of Agriculture was held on Tuesday at the Surveyors' Institute, Mr. T. Courtenay presiding.

Mr. Lawrence Hardy, M.P., moved a resolution advocating the Board of Agriculture to take steps to prevent the importation of gooseberry bushes, at least from those countries where the American gooseberry mildew disease was known to exist. He explained that great loss had been caused to fruit-growers in countries where the disease had obtained a footing, and, owing to the present demand for gooseberry bushes in this country, there was the extreme likelihood of the disease being introduced into this country. On the continent the disease had occasioned serious ravages, and fruit growers were extremely anxious to prevent it spreading in England.

The chairman agreed that every measure should be adopted to prevent the importation of the disease into this country.

The motion was accepted, and a recommendation that the Board of Agriculture be asked to send out leaflets was accepted.

Milk Regulations.

The Dairy Products Committee reported that having considered the report of the select committee appointed to ascertain whether any further legislation was required in order to secure the better control of the trade in butter and butter substitutes, they urged the Government to pass a measure through Parliament giving effect to the recommendations of the Select Committee. Concerning the regulations relating to the sale of milk, the committee further reported that these should be amended so as to provide that whenever a sample of milk taken for analysis was found to be below the limits fixed by the Board of Agriculture, the local authority should, within three days of the taking of such sample, and without notice, obtain a sample from the cows. In view of the unsatisfactory position of this question, the committee recommended that the President of the Board of Agriculture be asked to receive a deputation from the council to urge that the Board should take steps to obtain power to legislate regarding the direction of regarding the milk producer against prosecution for selling milk which, though genuine, was below the standard, owing to fluctuations due to natural causes.

Mr. C. Middleton, in moving the adoption of the report, said he was anxious to save farmers from the irritating and vexatious prosecutions they suffered in consequence of the existing regulations. Recently he gave evidence in a case against a Lincolnshire farmer, who was summoned at a London police-court. On that occasion it was proved conclusively that the farmer sold the milk just as it came from the cow; notwithstanding that, he was fined a small amount, with the addition of the costs, which amounted to £30. Farmers were saying, if this sort of thing continued, they should have to give up dairy farming, for the reason that they did not care to render themselves liable to prosecution.

The report was accepted, and the suggestion that there should be a large deputation to the President of the Board of Agriculture was agreed to.

Mr. Kendrick (Staffordshire) moved that the council express the hope that the Government would give its attention to the growth of sugar beet in the United Kingdom, and that it would support the Sugar Convention. He said that it was quite possible for beet to be grown in this country if it received sufficient encouragement.

Mr. J. Gardiner (Worcester) seconded.

Lord Denbigh contended that beet could be grown of a quality equal to, if not superior than, the best German grown roots. Last year fifty million tons of roots had been grown on the Continent, and the benefits had been enormous to the root-growing districts. Factories would have to be established on a large scale, factories to produce 40,000 or 50,000 tons a year, and that would require a capital of about £70,000. The excise duty on sugar was a bar to such developments. He asked an assurance from the Government that when the Brussels Convention came to an end, they would not agree to anything permitting foreign countries to re-establish hounties.

In answer to Mr. Davies (Cheshire), Lord Denbigh said that an average of thirteen tons could be grown to the acre and sold for about 18s. per ton.

Mr. Davies remarked that he could grow over thirty tons of mangolds per acre at the same expense of production.

The debate was adjourned until January.

Milk Consignee's Liability.

Mr. Humphreys (Bedford) moved: "This coun-

oil is of opinion that the liability of consignors of milk should cease when it reaches the consignee's hands." Several cases of hardship were quoted. An amendment was moved that the liability of the consignee should cease immediately the milk leaves his hands. It was pointed out that the railway companies would never agree to that, and it was also stated that the rates under "railway companies' risks" were prohibitive. The amendment was defeated, and the resolution carried.

Workmen's Compensation.

The following resolution, moved by Mr. Lord (Hain Street, Kent), was carried: "This council disapproves with the Workmen's Compensation Bill (as amended by the Standing Committee on Law), in that while farmers are liable for compensation even if they only employ one man, other employers are exempt if they do not employ over five."

A resolution urging the Government to deal with the question of local taxation next session was postponed until next meeting.

The council adjourned until Dec. 12.

LINCOLNSHIRE FARMERS' UNION.

Meeting at Stamford.

A meeting of the Stamford branch of the Lincolnshire Farmers' Union was held at the Stamford Hotel on Friday, November 2, when the chairman, Mr. John Thurlby, of Baston, presided over a good attendance. Among those present were Messrs. J. Woolston, G. Hudson (Empingham), J. Turner (Little Bytham), E. Clark (Castle Bytham), T. Rickard (Bourne), A. Oulenshaw (Horn), W. Tyler (Preston), J. Woolhouse (Barnack), Mawby (Kilthorpe), J. Bassett Rowell (Ridlington), G. Mason (Barrowden), F. G. Mountain (Essendine), &c.

The Chairman referred to the proposals to be submitted to Parliament relative to valuations, whereby independent arbitration was suggested in case of dispute between the respective valuers.

Mr. Ollarensaw thought that the Union should urge the necessity that, in case of a valuation, full details should be given by the valuer.

Other members concurred.

A lengthy discussion ensued upon local taxation, and Mr. Mawby deprecated the action taken by the Government recently in deferring the question when raised in the House of Commons. He moved a resolution to the effect that the Union urge the matter upon the attention of the Government, and this was unanimously carried.

Mr. Woolston called attention to the question of sugar beet growing and announced that Mr. Sigmund Stein had kindly undertaken to visit Stamford and discuss the question free of charge. He urged the importance of the matter, and said Mr. Mountain, who was present that afternoon, had been to Germany to inspect the methods of the manufacture of the sugar from the raw material adopted there, and had stated that the industry was in a most flourishing condition, the companies paying big dividends.

Mr. Mountain bore out Mr. Woolston's remarks, and Mr. Mawby expressed himself in favour of the idea, but thought it impracticable until the duty, or a large part of it, was removed. Until that was done he had not much hope of the success of the factory in the Stamford district.

The Chairman said he had been waiting to see the result of the founding of the Stamford factory before suggesting any action in the matter. If it were successful there was no reason why there should not be successful factories all over the county. He was afraid, however, that unless a factory was established in the Stamford district, the growth of the beet would be unworkable, for there would be no market.

Mr. Woolston replied that the pulp was useful for feeding stock, its saccharine properties being beneficial.

It was eventually decided to invite Mr. Stein to the annual meeting of the Union next month.

Annual Meeting of the Grantham Branch.

The first annual meeting of the members of the Grantham branch of the above Union was held at the George Hotel, Grantham, on Saturday week, when there was a small attendance. Mr. Willingham Fowler presided. Among those present were Messrs. J. B. Mason, J. T. Bettinson, T. Roberts, Grayson, Hipkin, R. C. Bemrose, T. Fisher, T. W. Dowse, C. P. Ingers, C. J. Rudkin, Gainsborough, Colman, and H. W. Palmer (secretary of the Union), Lord, R. C. Cooper, Pinder, T. Baker, Cartwright, G. W. Golding, &c.

The Chairman said the strong point made by Lord Carrington was that if the army were now fed upon home-bred and home-killed meat it would incur an extra expenditure of about £150,000 annually. Of course that seemed a lot of money, but what could they urge against that extra cost. They would see the better feeding of the fighting forces of the Empire, and that would be one advantage. (Applause.) Another advantage was that the money would go into the pockets of the British taxpayer, and surely the British taxpayer should have the first claim upon the public purse. If they encouraged home breeding and home feeding they would

provide British-paid labour, whereas if they fed the army on foreign meat they would not employ home labour. So that they would see that it cut against the interests of working men as well as against the interests of the middle classes.

Mr. T. Roberts proposed—

"That the Lincolnshire Farmers' Union view with great disfavour the proposal of substituting home-killed for home-fed meat in the army, as all other requisites for the army have to be of British manufacture. They would ask, as a matter of common justice, that meat be put on the same footing. They would point out that if the system which obtains at Aldershot and other places was extended, that is, of buying live cattle locally and having it killed by army butchers, it would prevent a fraud which has in so many instances been practised to the great detriment of the British farmer. They would point out that such a system, if brought into force, would confer direct benefit on agriculture in general."

Mr. R. C. Cooper, in seconding, said farmers had to pay rates to keep up the British army, and surely they ought to be the first to be considered in helping to feed the army. (Applause.) There was no other industry in England that would sit with arms folded, knowing that injustice was being meted out to them.

Messrs. Fisher, Bettinson, and Bemrose supported, the latter stating that Lord Carrington was sitting on the fence. He said the farmers were with him, but he (the speaker) differed, for

SHOW SECRETARIES.

Mr. R. CHALLINOR,
Cheshire Dairy Farmers' Association.

they were not, and Lord Carrington would find it out.

The resolution was then put, and unanimously carried.

Mr. Willingham Fowler was re-elected chairman of the branch, Mr. J. B. Mason hon. secretary, and Mr. G. W. Golding assistant secretary. A committee was also appointed.

SHOW GOSSIP.

The entries for the Scottish National Fat Stock Club Show at Edinburgh on December 3 and 6 next are as follows: Cattle, 158, which is slightly less than last year; sheep, 89; pigs, about 13; roots, grain, &c., 447; stands, 31; and butter-making, 30. The total was 775, said the secretary at a meeting of the club on Thursday, but he expected there would be 800 in all. In 1905 the total was 743, and in 1904, 820.

Framlingham is unable to invite the Suffolk Agricultural Association for its annual exhibition of stock and implements in June next, as the Great Eastern Railway Company would be unable to manage the heavy passenger and goods traffic on the single line. The committee of the association will therefore meet on Friday next, the 16th inst., at the Town Hall, Ipswich, at 2.15 p.m., to receive representatives of any town in Suffolk willing to entertain the association for its 1907 show.

"Business is Business."

"If you have any business, be short and let me hear it." Thus a well known writer expressed, some three centuries ago, his appreciation of our head-line. What do we understand by it? The practical man, living in this busy world, explains its meaning by his actions. He believes in facts, figures, and results. He does not admit vague statements or fancies, but demands the support of realities, such as he can handle and test.

Sentiment, however plausible on the surface, has no place in his consideration of the particular matter brought before him. He can only deal with something tangible, and at once dismisses, as unworthy of his attention and as merely waste of precious time, any subject which is wanting the evidence he naturally looks for.

This is the aspect in which we regard the resolutions of general condemnation that have lately been sent to us by the Milkstone and Tunbridge Wells Farmers' Clubs. We have published them, we have asked for detail and proof, but thus far we have been favoured with no further information.

On the other hand, we have received from correspondents letters approving the course we have taken in reporting the direction and trend of events recently affecting the hop-growing industry, but the complaints of the club members have not yet been substantiated.

We are quite ready and willing to receive and carefully consider any real grievance that our readers may be able to suggest. But we have no desire to prolong the discussion, and therefore we now say that we shall look upon the matter as closed, and our reputation as truthful reporters confirmed, unless we receive, before the date of our next issue, details of the complaints to which the resolutions profess to refer.

It is impossible to correct a fault until we are aware what its character; therefore, we can hardly be accused of persistent blindness unless our eyes are opened. Business is business, and we say to our critics, repeating the words quoted above, if they have any business, be short and let us hear it.

The Borough Market.

The tendency towards weakness to which I adverted last week has, unfortunately, developed to such an extent that hops have been bought at 5s. to 10s. below the prices that were previously ruling. The chief cause of this depression is evidently the slackness of demand. Merchants say that their customers, having operated to the extent of their immediate requirements, are not disposed to go farther in increasing their stocks.

As usual, when demand is checked, holders become more willing to sell, and when these two influences are combined, decrease in values follows as a matter of course. The large growers that have changed hands within the past three weeks have generally realised the best prices of the season, and I congratulate my friends who have exercised such good judgment in selling at the right moment.

The removal of these lots from the market has brought our available supplies into such small compass that we might naturally expect the maintenance of values. But the experience of the last few days has not confirmed our expectation, and we are bound to admit, however unwillingly, that the present prospects are not encouraging.

Doubtless consumers are considering the probabilities of foreign supplies, and are summing up their estimated requirements, and taking their holdings into account. Their hesitation as to enlargement of their engagements may thus be understood, and it appears to me not improbable that we shall be compelled to submit to the annoyance of a slow trade during the remainder of this year.

I earnestly trust, however, that my forecast may be proved to be wrong, and that circumstances as yet unforeseen may bring about a renewal of activity and a substantial improvement in market quotations.

Our Foreign Trade.

The returns just published show that the expected influx of foreign hops has fairly set in, as the imports for October, amounting to 23,092 cwt., are 14,060 cwt. in excess of the previous

month. The total arrivals since the opening of the season are 32,124 cwt., against 18,771 cwt. in the corresponding period of last year.

Our exports have considerably fallen off, being only 1,498 cwt. in September and October, 1906, while in the same months of 1905 we shipped to Colonial buyers 6,236 cwt. The balance of load upon our market is therefore much increased this season, the figure for this year being, thus far, 30,626 cwt. against 12,535 cwt. for 1905.

Although it may be argued that this is hardly a sufficient weight to materially affect us, yet the comparison is unfavourable when we consider the prospects of the trade, especially when we remember that the American import business has practically not yet opened, our chief supplies this year having come from the Continent.

We have reason to believe that America has a large surplus, of which we are bound soon to have evidence. We must also bear in mind that already we are aware that foreign hops of every description are selling at lower prices than the present English currency, and that this competition is likely to become more acute than less as the season progresses.

Such indications and possibilities should be closely observed by English holders, and it is for their information and guidance that I bring these figures before them, hoping that they may thereby be warned in time to the avoidance of future losses.

Hop Markets in Other Lands.

America.

Very little news has come to me across the Atlantic this week. There has been some increase in activity on the Pacific Coast in the better qualities, but the lower grades do not appear to attract much attention at present. Values are therefore rather unsettled, but the tendency is toward lower prices. In New York State the tone of business is in the direction of improvement, and a fair amount of trade has been done at fully previous figures.

Nuremberg.

There has been no cessation of activity since my last report. Business has been well supported by the local demands of consumers, but the chief feature in the trade is the exports to England and America, large orders for these countries having been recently filled. English buyers have chiefly taken Hallerdaus at 62s. to 75s., and America generally selects the better grades ranging from 72s. to 88s. The arrivals of hops during the week ending October 31 amounted to 5,000 bales, and as the sales were of equal figure, there was no addition to stocks.

During the month of October stocks have been increased by about 6,000 bales, but this has not affected values, which have been well maintained. The present approximate currency may be quoted as follows for the highest qualities:—Market hops, 78s. to 85s.; Hallerdaus, 100s. to 105s.; sealed Hallerdaus, 110s. to 115s.; Spalts, 105s. to 115s.; Wurtembergs, 100s. to 110s.; Badens, 105s. to 110s.; Alsatians, 100s. to 105s. Low qualities and mediums range from 65s. to 90s., according to selection. The present position of the market is quiet, but with no change of values.

Belgium.

From a letter received from a friend in Poperinghe, I learn that their crop did not yield half the expected weight, but he adds, "the hops are very good." He also tells me that great efforts are being made in every village to improve their methods of cultivation and curing, lectures being given under the auspices of the Government, the results being very manifest this season.

The markets, both in town and country, are at present very quiet. The brewers are buying but slowly, and exportation has become slack, consequently prices have been slightly reduced. Alost being now quoted at 75 to 77½ francs and Poperinghe at 70 to 72½ francs.

The foreign trade of Belgium for September is given officially as under:—

Imports 2,550 cwt.
Exports 1,936 "

Of the imports the bulk was received from Germany and France, as England only sent in about 80 cwt. In the exports the figures are practically reversed, 1,443 cwt. being shipped to England, and only a trifling quantity to Germany, the bulk of the balance being taken by France and Holland.

The half-yearly hirings at Morpeth for single servants, male and female, were held on Wednesday, when, notwithstanding the heavy and incessant rain from morning till dusk, there was a large attendance. Masters, mistresses, maids, and men availed themselves of the shelter of the Corn Exchange provided for them on such occasions by a number of philanthropic ladies. Wages for both sexes ruled much the same as they did twelve months ago. Men got from £10 10s. to £14 10s., and in special cases £1 more, and lads from £4 10s. to £9 10s. Girls from £3 10s. (first place) to £7 and £8, and women from £7 10s. to £10.

Midland Notes.

FARMERS are so often charged with refusal to move with the times that it is pleasant to find scientific people, moving in new paths, emphatic in their contradiction of the old idea. From Professor Collinge, of Birmingham University, I hear that the new department of economic zoology is already finding much appreciation in the Midlands. It is a fact, I believe, that in regard to certain pests concerning which official leaflets are issued, the University has received many more applications for information this season than the Board of Agriculture.

THE university department, of course, is being worked with energy and on practical lines. When any unfamiliar fruit, field crop, or garden pest appears the farmer or orchardist who suffers would almost certainly be able to identify it by looking through the fine museum of preserved specimens—that is to say, if his note did not bring Mr. Collinge on to the ground the same day, as often happens. It is especially pleasant to find the newest enterprise of all so thoroughly appreciated—the "insectory," that is, where such enemies of insect pests as the ichneumon flies and ladybirds are bred that they may be despatched when needed to districts where they may be of use. If the British farmer were so suspicious of new-fangled ways as his detractors say he might look on such novel enterprise with some distrust. As it is, it is a local farmer's orchard, lent for the purpose, which forms the present breeding-ground, and the department, Mr. Collinge tells us, is already overwhelmed with applications for assistance in this direction.

CONTINUED rain has made the ground much too soft for cultivation for a little time, but for the most part we are far enough forward with the work of the season to be able to endure a few days' delay without much repining. We have had none too much of rain even as it is; even now some of the springs which dried up early in the year are only just beginning to flow again. We are, by the way, not all equally lucky. I hear of districts in Worcester and Warwick where very little opportunity for corn sowing has been enjoyed this autumn. In such cases the wheat acreage will certainly go down substantially, for after the middle of November very little is drilled. Elsewhere it may be different, but local prejudices are all against late sowing.

LIVE stock generally have been making good progress lately, but the warmth and rain of the past five weeks have not been an unmixed blessing. In agriculture is much antagonism of interest, and so the Leicestershire and Warwickshire graziers who delayed buying in stores during the early autumn are now complaining that they have to pay substantially more, and are hardly likely to make much profit.

SHEEP in particular are dear just now, so that graziers who made little or nothing out of them a year ago are very reluctant to pay the couple of shillings or more extra per head that are demanded today. Cattle, of course, have not advanced so much proportionately. But then really good stores are not very plentiful, and neither do fat cattle sell so readily as food mutton. Feeding also is expensive. In Stafford and Derby especially one hears of stock owners who have been feeding for a couple of months past almost as in winter; and the brewers' grains so favoured in this part of the world are now a rather costly food at 6d. per bushel.

SOME very nice fields of kohl rabi suggest again that this crop might be worth more attention. It has apparently justified its reputation as a drought resister this season, and in districts where turnips are much midwived one has seen kohl quite healthy and flourishing. What a pity that our friends the seedsmen cannot bring down the price of seed to something just a little nearer the level of rape or turnips. One and ninepence to half a crown a pound is a good deal to pay when one needs 4 lb. or so per acre. But if the seed seems, as it does to some of us, too dear to buy in bulk, at any rate kohl might be worth a little more consideration for patching up bare spots among the swedes and mangolds.

CONGRATULATIONS to the farmers of the King's Norton, Northfield, Rubery, Rednal, and Beoley districts! For long it has been their fate to cultivate land in what is technically an "urban" district, albeit some of them are miles from a railway station, and their area, as a whole, is thinly populated. The explanation, of course, is that just one corner of it joins Birmingham and boasts both prosperous residential suburbs and a crowded manufacturing and artisan population. As these latter districts practically govern the entire area and show a disposition to launch out into ambitious

tramway, secondary education, electric lighting, and similar schemes, the outlook for the purely rural parts, which pay the same rates and get no benefit at all from them has been far from cheerful. The formal proposal this week that the urban and rural parts, so diverse in character, so devoid of any community of interests, should formally part company, comes none too soon. Is it in vain to commend the suggestion to other similarly situated "urban" areas in the Midlands?

November 8, 1906.

Royal Commission on Horse Breeding.

The Royal Commission on Horse Breeding, at a meeting in London, on Monday, considered the report of the conference on the question of horse breeding in the United Kingdom held by Earl Carrington (President of the Board of Agriculture). After giving the matter due consideration they resolved to defer taking any steps pending the receipt of information as to the course the Government will adopt as the outcome of the conference, but in the meantime to submit the premium list for 1907 to His Majesty and the Treasury for their approval.

The number of mares served during the past season was laid before the Commissioners, and in cases where stallions had failed to get the required number the premiums were reduced. The percentage of foals for the 1905 season was presented, and the average considered very good. These figures will appear in the Parliamentary report issued next year.

Contagious Diseases of Animals.

Summary of Returns issued by the Board of Agriculture for the week ending Nov. 6, 1906:—

	Swine Fever.	Swine Slaughtered as Diseased or Exposed to Infection.		Outbreaks.	Sheep and Goats.	Outbreaks Reported.	Rabbits.	Cases Confirmed.	Other Animals.	Dogs.	Glanders (including Farcy).	Animals Attacked.	Outbreaks.	Foot-and-Mouth Disease.	Animals Attacked.	Outbreaks.	Anthrax.	Animals Attacked.	Outbreaks.	Period.
		No.	%		No.	%	No.	%			No.	%		No.	%		No.	%		
		151	39	35	11	12	...	...	...	...	...	...	...	...	...	...	...	...	...	Week ended Nov. 3, 1906.
		154	154	16	12	12	...	...	...	...	...	...	...	...	...	...	...	...	...	Corresponding week in 1905.
		154	154	19	11	11	...	...	...	...	...	...	...	...	...	...	...	...	...	Total for 44 weeks in 1906.
		5,614	3,683	984	313	725	...	...	...	...	...	...	...	...	...	...	...	...	...	1905.
		3,083	5,035	692	1,132	1,380	...	...	...	...	...	...	...	...	...	...	...	...	...	Corresponding period in 1905.
		6,062	1,270	1,301	1,270	1,270	...	...	...	...	...	...	...	...	...	...	...	...	...	Total for 44 weeks in 1906.

Note.—The figures for the current year are approximate only.

In the House of Commons on Tuesday, Viscount Tournour asked Sir E. Strachey, as representing the President of the Board of Agriculture, what was the average weekly wage of the labourers formerly employed by the Earl of Cornwall on the Burwell estate in Cambridgeshire and since dismissed; and what was the size and the rent asked for the small holdings on the said estate which were offered to the displaced labourers, and which the majority did not avail themselves of. Sir E. Strachey, in reply, said the average weekly wage of the thirty-two adult labourers who were employed on the Crown farm at Burwell was 14s. a week. In addition nine lads under twenty were employed whose average weekly wage was 8s. One of the adult labourers was a woman, who was paid 8s. a week. My noble friend has no information on the other matters referred to in the question.

CORRESPONDENCE.

The Price of Hops.

SIR,—As a farmer I regularly subscribe to the MARK LANE EXPRESS, and as a brewer I invariably read the hop news it contains. I have not seen the discussion in your contemporary on "The Hop Industry," but knowing as I did the enormous stocks of 1905 hops carried by every brewer of my acquaintance, it was evident throughout the summer that the result of this season's growth could only be disappointment to the growers. That result required no "bearing" on the part of the merchants.

"Business is business," and with 1905 hops in stock sufficient to last to the end of next June at least, it is foolish to suppose that I or other brewers were not sufficiently indifferent buyers to be able to hold off the markets until we were able to gauge accurately the probable supply of Continental and American hops, and to judge for ourselves whether on the whole there was likely to be any shortage. One's sympathies may be, and are, with the growers; but so I find people's sympathies are with me when I grow a poor crop of wheat and have to accept an even poorer price—but no one is platonic enough on that account to pay me the more for my wheat.

Merchants have to sell to brewers, and surely commonsense will refuse to blame them for not paying the growers prices which would simply mean that they would have to sell at a loss or not sell at all.

As to whether factors and merchants, that is two middlemen, are required is perhaps another matter. But my own opinion is that neither can be well done without.

That the brewer should buy direct from the grower is an absolute impossibility. I number many hopgrowers among my friends, and I have tried to do business with them, but with never any very satisfactory results.

The grower in the first place wishes to sell probably his whole growth, or certainly the growth of certain plantations. The brewer, on the other hand, wants a certain number of various qualities, and therefore the brewers' requirements do not tally with what suits the grower. But possibly the factor and the merchant might be merged in one? But, in that case, is the grower ready to place himself in the merchant's hands, or is the factor going to provide travellers to show his hops round to the various brewers, and he is prepared to give the six or nine months' credit which brewers require? Growers talk of grubbing up plantations and warn brewers as to the result. But how many farmers have had to turn their wheat lands to other purposes, and though the result may be dangerous to the country as a whole, the miller is not affected by the warning, and why should the brewer be?

Under present conditions only the best land for wheat and hops can continue to grow those crops. Inferior land for that purpose must be turned to other use, and when my hop friends will vote for a thumping duty on wheat, I shall be prepared to reciprocate by voting for a duty on hops.—Yours faithfully,
BREWERY AND FARMER.
November 7, 1906.

Forestry in France.

DEAR SIR,—I am sending you herewith a letter I have received—an important communication, I venture to think—from Mons. Ch. Broilliard. It speaks for itself. I forbear all comment.—Yours truly,
CHARLES HANCOCK, B.L.

November 9, 1906.

Letter of M. Ch. Broilliard (Agronome distingué), Conservateur des Forêts en retraite.

Morey, Haute Saône.

November 5, 1906.

To Mr. Charles Hancock, B.L., Member of Scottish Arboricultural Society.

Monsieur,—I am touched by the kind references the Editor of the MARK LANE EXPRESS has allowed to be inserted in this week's issue of his widely-read agricultural organ.

I certainly think that our method of cultivating and disposing of timber in France is a very good one. We have had plenty of experience, and our methods are the gradually-acquired result of that experience. It has required time to regulate and perfect it. I cannot help admiring our system of cutting away the underwood and the tall timber.

The forest officials put a reserve mark on all the best trees, often very numerous, and only the surplus which is of the least value is felled. Nevertheless, this surplus finds an easy market, and the purchasing contractors cut it down, carefully respecting the reserved trees.

In the case of the fir woods, only the trees to be felled are marked, and the buyers glean them out, so to speak, from the dense forest. All these trees, owing to the competition that obtains, sell well, and, thanks to the honesty of the forest officials and the training of the inspectors (keepers and rangers), the felling is carried on with regu-

larity, and the trade in general may be said to be an honest and upright one.

This is, in the first place, due to the training received by the officials at the Nancy School of Forestry ever since the year 1824. I can only trust that this may continue! Elsewhere—that is to say, in other countries—other customs prevail which may in time give, it is to be hoped, equally good results.

As regards forestry knowledge and initiation into the secrets of sylviculture, this is gained by practical experience in the forest, as is shown by Mr. Fankhauser in his paper to which you refer me. But it is almost indispensable to be prepared for it, by instruction on the ground, and, for this purpose, to have plenty of well-kept forests for young men to study in.

I fear that these are lacking in England! I have there noticed underwood left without method or system—trees of no good dimensions, and picturesque trees, on the other hand, which I have inspected in the country and in the parks, and even a compact forest of larch trees, above Radnor. But all this does not indicate any idea of a well-ordered natural forest—in a good productive state.

We are still far from having attained perfect order or what may be called a system regulated to perfection in most of our woods; but we are tending to this end with more or less success, and careful cultivation of compact masses of timber is happily the rule.

You will surely arrive, without much groping (*sans beaucoup de tâtonnements*), at a good system of sylviculture in England, with the aid of experienced forestry officials of India, such as Mr. Fisher, Mr. Gleadow, and others, and by calling others to your assistance, if necessary. Reafforestation will also afford you interesting and useful studies. All that is required is a persistent methodical spirit—an *esprit de suite*.

Yours truly,

(Signed) CHARLES BROILLIARD.

The Farm Outlook in Hunts.

SIR,—Some of our farmers who were for months crying out for rain would now be glad of a temporary cessation of the somewhat heavy downpour with which we have been blessed of late. Root carting has made some considerable progress, but many acres of kohl-rabi and some extent of mangold land is still uncleared.

Although the long-continued drought affected the growing roots on the lighter land and reduced the weight, if not the quality, yet we hope to store quite an average crop, since the plant of mangolds was especially good and the early season most favourable.

A large proportion of the wheat is sown, and occasionally the drills are already showing from one to the other end of the fields. So far as we judge, the plant appears to be almost too thick; it was up quickly, and each kernel appears to have grown. The rooks and other birds had a full supply of corn on the stubbles, so that the newly-sown wheat was not much disturbed.

More than the usual acreage is drilled with winter beans, as our farmers have found both winter and spring beans paid better than any other crop during the last two years; therefore they argue that more beans should be grown; mayhap they forget that spring beans, and, to a lesser extent, winter also, are a very risky crop, and one which in wet, cold seasons gives but a very poor return of corn, however great may be the crop of straw.

Barley has sadly lost favour with our farmers; the yield has been good of late years, especially so this season, and the condition excellent, but the grain is coarse and hard; the merchants are most unwilling buyers of Hunts barley. Are farmers not growing too much barley? S. S.

November 6, 1906.

Passing Thoughts on Barley Growing.

SIR,—Although the facts adduced from the experiments which have lately been made (see Professor Hux's pamphlet on the subject) are undoubtedly valuable, still it is obvious, bearing in mind the results from a practical point of view of previous investigations, that it would perhaps be unwise to draw any definite conclusions, as this crop, from its delicate nature, is so liable to be affected by the atmospheric changes so often prevailing, both before and also at the time of harvest.

Besides this, barley, from having no outside protection in the shape of chaff as wheat and oats have, is so much more liable to be acted on by other circumstances not applicable to the two grain crops named, over which the grower has no control.

It must also be borne in mind that the use of the self-binders, rendered imperative by the scarcity of labour, has by no means improved the

quality of this grain when offered in the market, but in many cases where there is a strong undergrowth of clover, or anything else green, they are productive of harm.

It appears to me, from having been a grower as also a considerable buyer for many years, that the three essentials for growing good malting barley are:—First, suitable soil; secondly, favourable seasons; and thirdly, early sowing, neither of which can the farmer make to order.

Then again, I have, after many trials, arrived at the conclusion that no hard and fast line can be drawn as to the application of artificial top-dressing, as different seasons produce such different results, indeed, I may almost say, quite opposite results.

Having on several occasions gone through the crops preceding the barleys exhibited for competition at the various shows held in both Wilt and Dorset, I have come to the conclusion that the best quality is generally grown after mangolds.

In conclusion, I trust I shall not be looked on as heretical, but I am strongly of opinion that the value of such shows is often much overrated.

Devises, November 6, 1906.

W. FOOKES.

Home or Foreign Meat for the Army.

SIR,—The army, say 300,000 men, would need the carcasses of 75,000 oxen of 96 st., 8 lb. to the stone each, to give 4 lb. of meat to each man daily throughout the year.

The present market value of these carcasses raised through home land and labour would be £1,482,000.

The Government decided not to invest the taxpayers' cash in home produce and thus retain it in the country's circulation, which through the multitudinous channels of trade would, circulating again and again, revivifying trade, return to the taxpayer, and be permanently held in the nation's cash circulation.

On the contrary, instead, the Government decided to invest the taxpayers' money in purchasing foreign meat for our army for the purpose of showing, by two skilled sophistical lawyers, an apparent gain to one department of the army of £150,000 in this meat deal, not at all heeding the serious loss brought on the nation by deleting from home circulation cash—£1,332,000—to carry out the deal, and through investing it in foreign lands, rival industries, and circulation, lost to our country for ever.

May not this "free trade" policy of always buying in the cheapest market be characterised as economically unsound and ruinous, and gradually destructive of our home industries?

If, on the contrary, by judicious application of the taxpayers' cash at home the nation would not only have raised the meat required for our army, but at the same time have recovered to productiveness, from derelict lands, a smiling estate of many thousand acres, land and cottages; and the taxpayers' cash retained in circulation, revivifying many trades and industries, would be held at home for ever.

Southall, October 30, 1906.

ALFRED WELCH.

Hop Manures at the Brewers'.

SIR,—In your issue of the 5th inst. we noticed a paragraph headed "Hop Manures at the Brewers'" (p. 493), referring to some confusion that had arisen in reporting upon the prize samples in the various classes of hops.

We now enclose a letter* from Mr. Ernest Mannington which, as it clears the matter up, you will oblige us by publishing in *extenso* if possible.

We have full permission to use this letter in any way we like.—Yours faithfully,

THE ANGLO-CONTINENTAL

(late Ohlenloeff's) GUANO WORKS.

15, Leadenhall Street, London,

November 9, 1906.

The following is the letter referred to:—

Eaglesden, Brenenden, Cranbrook.

DEAR SIRS,—With reference to your letter of this morning and inquiry as to prizes at the Brewers' Exhibition, I beg to state that the hops shown in Class 4 were grown with the aid of manure supplied by the Anglo-Continental Guano Works, as was also one example shown by me in Class 5.

The first prize in Class 5 was grown by the aid of manure supplied by Messrs. Fison's.

I trust this is clear, and if I omitted to specify the variety of artificial used in Class 4 it was done inadvertently.—Yours, &c.,

ERNEST MANNINGTON.

Barley Protest at the Brewers' Exhibition.

SIR,—Owing to an error in typing the paragraph relating to the above as appearing in your recent issue, it is made to appear that the protest and disqualification refer to Classes 7, 8, and 9, but it should be Class 7 only. Will you kindly insert in your next issue, and accept our apology for the blunder.—Yours faithfully,

DALE, REYNOLDS AND CO. LTD.

November 6, 1906.

Northern Notes.

THE *Times* recently said in regard to the restrictions imposed with the swine fever order, that "it is little wonder pig-breeding is discouraged, and that many farmers are urging that the restrictions are worse than the disease." As a matter of fact, the pig trade is being gradually killed, and before long we shall find in the scheduled districts that the figures are altogether missing from the market returns. If we take the last official return of market prices issued by the Board of Agriculture, and cast up the figures relating to pigs, we find that a grand total of forty-five stores were entered at Hull, Leeds, Newcastle, Wakefield, and York.

TO be quite accurate and fair, these forty-five animals were all entered at Wakefield, while the other four markets were all a blank, so far as store pigs are concerned. Of fat pigs, all presumably ready for the butcher, there was an average for each market of just over 300 head; the pens at Wakefield were empty, and those at Leeds contained thirty-four. Cannot more drastic measures be adopted to stamp out this disease? It is all, more or less, a question of compensation.

IF the pigs in an infected area were all slaughtered after a period allowed for disinfection of the district, a clean bill of health might be given. Under present arrangements, while markets which are kept in a perfect sanitary state are practically closed to stores, a dealer may turn his cart into the temporary "market," and hawk his pigs about the country until he finds a customer. This was done a few days ago in a market which had been shut up over six months, and "opened" under a modified order.

STORE pigs could be sold in the market, but could only be removed under licence, so that in the event of the swine developing disease they could be traced, and the market saddled with being the cause of the outbreak. A dealer drove into this said market with a load of pigs, did not take the horse out of the shafts, and there he could stand defying the inspector, while bargaining for the sale of his stock. Is it pretended that disease cannot be spread from a cart, which may not have undergone disinfection for weeks, and yet that a market cleansed and lime-washed with the greatest regularity may be a prolific source or medium of contagion?

HOW easily we are distressed by causes natural and beneficial in their inception and sequence. A week of rain—and heavy rain too—has sent many farmers into a state of grumpiness, just because they were prevented doing certain things they had set their minds on accomplishing that very week.

SHOULD we be any the better off if fine weather, dull weather, any sort of weather we desired could be obtained to order? We doubt it. It must be conceded that a week of very "trying" weather has just gone by, but the compensating effects of the rains will more than counterbalance the temporary inconveniences experienced during their downfalling.

IN the north, and especially on land with a chalky subsoil, a lot of rain was required to replenish the vanishing springs and the depleted reservoirs and cisterns. Though the precipitation was very copious for a week, its effect upon the becks and small streams is not at all perceptible, an indication that the lower strata was devoid of any great stores of water. The mildness of the season has had a remarkable influence upon vegetation, and one can hardly recall a season of such verdant beauty as that which lingers upon the portals of November. Farmers are conserving their indoor feed, the quantity of pasture herbage enabling a great economy to be effected in the use of cultivated crops.

THE discussion of the sheep colouring question by the National Association this week comes as a reminder of the remarks made to me by a New Zealand flockmaster two or three years ago. After visiting the Royal Show he expressed his surprise at the methods of showing sheep in this country. He contended that visitors, both experts and novices, should have an opportunity of seeing sheep, other than lambs, fully developed, both in carcass and in wool. Their wool, he thought, should not be tampered with, and he was particularly struck with the practice of colouring the various breeds and thereby disguising the natural tendency of the wool.

SOON afterwards the R.A.S.E. passed a resolution that the excessive colouring of sheep was "objectionable." The council of the Lincoln society would have none of this interference, and when the matter was discussed several principal flockmasters almost fell into indignation on the subject, and a resolution was passed pledging

members to resent any dictation from outsiders. The custom having obtained so strong a hold on the Lincoln and Down breeds will, if it dies at all, die very gamely.

THE county by-laws in these northern latitudes are yielding a fine crop of police-court cases. The neglect of vehicular lights, straying pigs, negligent drivers, and the rustics who indulge too freely in words which should be tabooed from their vocabulary are the main class of offences and offenders, not forgetting the ubiquitous, scorching chauffeur. Dwellers in the country have small respect for time, and the shortening days lead cartmen and waggoners into error. One had his lamp ready trimmed in his cart, instead of having it lighted and affixed outside.

FIRST offenders do not escape a fine; the police and bench get their pound of flesh. A pig escaped while the farmer was passing the complements of the day to the representative of law and authority. The policeman was particular to describe the pig as of the "blue and white" breed, which was not, perhaps, a very material point, as the owner admitted the "offence," and paid a crown fine to the county for his remissness of guardianship.

A BUTCHER summoned at Selby for a breach of the Sheep Dipping Order met with consideration from the magistrates, the case being dismissed. He was told to "study the Orders." The clerk: "He won't understand it when he does," an observation which evoked unrestrained laughter.

November 9, 1906.

Prize Root Competitions.

Messrs. W. R. Smith and Son's (Tattenhall Road, Borne, near Chester) annual competition for roots attracted a larger number of competitors than usual. Through these the counties of Cheshire, Shropshire, Staffordshire, Warwickshire, Worcestershire, Herefordshire, Gloucestershire, and Denbighshire were well represented by excellent specimens of mangels and swede turnips, grown by the aid of Messrs. Smiths' special manures.

The first prize of £30 for mangels went to Mr. Leonard J. Smith, Newent, Gloucestershire; Mr. H. B. Bomford, of Exhall Court, Alecter, Warwickshire; and Mr. J. Robert Shepherd, Parkside, Aston, Cheshire, taking equal second. The variety staged by each of these three competitors was Garton's Improved Breed of Large Yellow Globe.

In the swede turnip class Mr. J. E. Willis, of Rossett, Denbighshire, staged the heaviest roots, but as he was a previous winner, had to concede a handicap to other competitors: Mr. Arnold Sherwin, of Waverton, took the first prize. Other successful competitors included Mr. Frank Burgess, Arrowse, Birkenhead; Mr. E. F. Bellamy, The Moat, Newent, Gloucestershire; and Mr. H. P. Bomford, Exhall Court, Alecter, Warwickshire.

Hands-on prizes were also offered for cheese, the first prize being captured by Mr. Robert Bourne, Bickerton, Cheshire; the second by Mr. Jos. Darlington, Stanwardine, Salop; and the third by Mr. James Blake, Calveley Hall, Cheshire. Mr. G. P. Miln and Mr. Charles Bate acted as judges, whilst Mr. Gordon Smith and Mr. H. A. Longrigg made efficient stewards.

Fruit Growers at Wye College.

Under the chairmanship of Mr. Lawrence Hardy, M.P., a large and representative conference of fruit growers from the fruit-growing counties of England was held at the South-Eastern Agricultural College on Wednesday. Papers were contributed on Planting of Fruit Trees, Strawberryes, American Blight and Fungus Diseases. In the latter paper reference was made to the American gooseberry mildew, the appearance of which in England has been noted by the college mycologist (Mr. Salmon), and a resolution calling upon the Board of Agriculture to take immediate steps to prevent further importation of gooseberry bushes and to destroy infected stocks in this country was unanimously passed. The disease appeared in Ireland in 1900, and has made most extensive ravages in that country, and serious alarm is felt by growers that a similar result may ensue in England unless drastic measures are immediately taken.

Sound waterproof covers are essential for every estate and farm, especially for the protection of valuable agricultural engines and machines against the inclement winter weather. Messrs. J. Rands and Jeckell, Ipswich, manufacture these covers in a variety of qualities, all of which are treated with a process making them not only waterproof, but rot-proof. We recommend estate agents and farmers to procure the firm's illustrated catalogue of these goods, for which they are justifiably celebrated. They may be had direct from the head office at Ipswich.

NOTES AND NEWS OF AGRICULTURAL SOCIETIES.

Devon.

The question of subscribing to the Royal Agricultural Society came in for a deal of discussion at the meeting of the Devon County Agricultural Association on the 2nd inst. The association had decided to discontinue their subscription, but at this meeting they were asked to rescind the resolution, for, as one member remarked, the aim of both societies was to benefit agriculture, and they should work hand in hand. Another member said there was a very strong feeling among residents of the county in respect of the Royal Society, because twice they subscribed handsomely to receive the society at Exeter, and each time they went elsewhere, notwithstanding that on the last occasion they were asked to invite the society. Major Tucker said what influenced the finance committee in recommending the discontinuance of the subscription was the fact that other similar societies did not subscribe. The rescinding of the resolution was eventually agreed to.

East Sussex Farmers.

The East Sussex Farmers' Club opened their winter session on Tuesday with a meeting at Lewes, when it was reported that the receipts of the past year totalled £72 3s. 10d., and the expenditure £60 8s. 11d., leaving a credit balance of £11 14s. 11d., as compared with a balance of £6 7s. 5d. standing to the credit of the club at the end of the previous year. Officers for the ensuing twelve months were elected as follows:—Chairman, Mr. W. F. Ingram; vice chairman, Mr. A. Wadham; secretary and treasurer, Mr. Walter Lintott (to whom hearty thanks were accorded for past services). Several new members were elected, including the Earl of Chichester.

Lincolnshire Chamber.

At a special meeting of the Lincolnshire Chamber of Agriculture held on the 2nd inst., the Land Tenure Bill was considered, and a resolution that "while they would welcome freedom of cropping, they considered that this Bill as a whole would alienate the sympathy and help of the landowner from the tenant and lead to litigation, which would only benefit the valuers and lawyers," was carried unanimously. The Land Purchase Bill, introduced by Mr. Jesse Collings, was also considered, and after discussion a resolution sent by Mr. Chaplin was carried. The resolution declared that a large increase in the numbers of occupiers and owners of land would be to the general advantage of the country. Other resolutions carried were:—A resolution sent by the Briggs branch expressing a hope that the Government would give its attention to the subject of sugar beet growing, and that it would support the renewal of the Sugar Convention; and a resolution declaring that the liability of consignors of milk should cease when the milk reached the hands of the consignees.

West Riding Chamber.

The West Riding Chamber of Agriculture at their last meeting considered the report of the Central Chamber's Dairy Products Committee on the milk standard, and passed a resolution that the liability of consignors of milk shall cease when it reaches the consignee's hands. As regards the Public Slaughter-houses Bill, one member expressed the opinion that if the Bill became law it would prove a great blow to agriculturists. It would be a great inconvenience, especially for butchers, to be compelled to kill at public slaughter-houses instead of at their own places. It would also be a hardship for farmers within a mile or two miles of a public slaughter-house to have to take a sheep or pig there to be killed. Other members spoke against the Bill, and a resolution that the measure would prejudicially affect producers of meat, and that it ought to be withdrawn, was carried. Resolutions were also passed in favour of the Workmen's Compensation Bill now before Parliament, and in favour of a reform in local taxation.

Warwickshire Chamber.

A paper written by Colonel W. H. Birkbeck, C.B., Inspector of Remounts, on the French remount system for the cavalry was read at the last meeting of the Warwickshire Chamber of Agriculture by Sir H. Gilzean Reid, who moved: "That this chamber is of opinion that, in order to encourage farmers and others breeding the class of horse suitable for military purposes, and to preserve the sources of supply in this country, the Government be urged to purchase a proportion of their annual requirements in the autumn of the year in which the animals are three years old." After a few speeches the resolution was carried unanimously. Sir H. Gilzean Reid presented a report of the recent meeting of the Chambers of Commerce and Agriculture held at the Westminster Palace Hotel, at which the question of railway charges was dis-

WE MAKE GUNS

We sell to the user with only one small profit.
We sell for cash direct to the user.
We buy the finest materials to be obtained.
We pay cash for all materials.
We employ some of the finest workmen in the Gun Trade.
We use finest machinery for machine operations.

RESULT.

We sell for £23 Guns of a quality for which sportsmen have previously paid from £50 to £80.

We sell thoroughly reliable Guns.

We get the finest shooting it is possible for guns to make.

Our "Field" Hammerless Ejector Gun.—A perfect Ejector Gun of the finest quality, £25. If made with the best single trigger mechanism ever invented, £27. A perfect pair of these guns, beautifully matched, £53. A perfect pair of Single Trigger Guns, £53.

"The Gun of the Future," as an Ejector, £15. "The Gun of the Future," without Ejector, £10. A sound and reliable gun, well made, and perfectly balanced, which will give entire satisfaction.

Pattern 8662, £6.—A sound and reliable hard shooting and hard wearing hammerless gun. Better than many sold at double the price.

Pattern 8368, £4.—A sound and reliable hard shooting and hard wearing hammer gun. Better than many sold at double the price.

ESTABLISHED 20 YEARS.

Bankers: London and Midland Bank, Temple Row, Birmingham.

MIDLAND GUN CO.

Demon Gun Works,

PRICE STREET, BIRMINGHAM.

cussed, and the chamber decided to uphold the attitude of that conference, especially in regard to the contracting out conditions, under which the railways escaped the payment for damages to goods in transit. By five votes to three the members refused to support a resolution in favour of home-fel meat.

Worcestershire Chamber.

The question of the profitable growth of sugar beet was one of the subjects discussed at the last meeting of the Worcestershire Chamber of Agriculture. One member said that if the Brussels Convention abolishing sugar bounties were renewed and the Government would give growers a rebate of 1s. 8d. from the duty, sugar could be produced from beet at a profit. It had been shown, he added, that the English farmer could grow sugar beet to better advantage than Germany, but, he asserted, the money necessary for the provision and equipment of the necessary manufactories would not be forthcoming until there was some guarantee for the future action of the Government. Another member remarked that he saw little likelihood of sugar beet being grown profitably while the fiscal question was in its present unsettled state. Eventually it was agreed to approach the Government as to the course intended to be adopted upon the expiration of the Brussels Sugar Convention, and to urge the Central Chamber to reappoint the committee which formerly had charge of the matter. A proposal that the liability of consignors of milk should cease upon delivery at the forwarding railway station was defeated, and it was decided to urge the necessity for legislation providing that the liability of consignors of milk shall cease when it reaches the consignee's hands, objection being raised to the disability under which producers lay having regard to the refusal of railway companies to allow them to lock their tins in transit. The meeting also passed a resolution against the provisions of the Slaughteries Bill.

How Irish Farmers Raise Cash.

Mr. G. W. Russell, of the Irish Agricultural Organisation Society, gave evidence before the Royal Commission on the Congested Districts of Ireland, described the devices to which the people resorted to obtain cash in remote districts where there were no banks. "Trust auctions," at which the auctioneer would give credit to the buyer, and pay the seller cash (at a discount) were, he said, a feature of the life in some districts.

A party of small farmers in a parish being in need of cash put all their cows together and sent them in the name of one of the party to a trust auction. Then the others of the party attended the auction and ran up the prices, and bought the cows at a good round sum. The buyers obtained three months' credit, and the auctioneer paid the seller. Arriving home the party divided the cash which they so badly needed, and then resold the cows. He knew of one case in which a man took a cow from auction to auction and raised £75 on her.

A meeting of farmers and agriculturists whose interests were affected by the recent Eastern Command manœuvres in the Lewes district was recently held at Lewes, and the proceedings were characterised by unanimity and determination in regard to the question of compensation for loss sustained during the military operations. After an interesting discussion, during the course of which views of a rather emphatic nature were expressed against the action of the War Department with reference to the claims for compensation made by landowners and farmers in the manœuvres area, it was decided to obtain legal advice in the matter with a view to proceeding to arbitration, more particularly in regard to the claims for compensation in connection with the depreciation in the value of their sheep, caused by disturbance.

NOVA SCOTIA

Offers advantages to British Agriculturists with moderate capital. Improved Farms at Low Rates. Fertile Lands. Famous Fruits. Enormous mineral deposits of Coal, Gold, Silver, Iron, Copper, Lead, and Tin. Climate temperate and healthy. Easily accessible to all the principal markets.—Full information supplied by the Agent-General for Nova Scotia, Mr. JOHN HOWARD, 57A, Pall Mall, London, S.W.

GALVANIZED ROOFING SHEETS, WIRE NETTING, COMPLETE BUILDINGS, IRON FENCING, HURDLES, GATES, TANKS, CORN BINS, TUBES, ROOFING FELT, RAILING, FENCING WIRE, BARB WIRE, VARNISH, AND POULTRY APPLIANCES.

CATTLE WASH.

Used on the Herds of H.M. the King.

What it will do.

CUTOXINE removes all dirt, prevents! Scurf, improves the coat, promotes abundant growth of hair, prevents skin diseases, cures Ringworm, and destroys Lice and all parasites.

What it has done.

Testimonial from Mr. D. Collier, Agent to R. R. Bothwell, Esq., Rokeby, Rutland, England.

Dear Sirs,—I have pleasure in saying that we use your CUTOXINE for preparing both Shorthorn Cattle and Pigs for exhibition purposes, and find it a most excellent preparation both for hair and skin. Over 50 Prizes have been won during last two months with animals prepared with CUTOXINE.

Write for Free Sample.

Fertilisers and Feeding Stuffs.

USEFUL INFORMATION FOR FARMERS WHEN BUYING.

Approximate Unit Cost of Fertilising Constituents.

It is necessary for guidance in the economical use of fertilisers, and especially in the purchase of Complete and Special Manures, that the relative unit cost of the principal fertilising constituents should be studied; the subjoined table affords information on the subject. By multiplying the guaranteed minimum percentages of a fertiliser by the unit costs given in the table, the buyer will get a good idea of the commercial value of any chemical manure offered to him. The unit values are subject to variations from time to time, and in this respect we shall endeavour to keep the table up to date, besides which, buyers living in remote districts may have to pay a little more for heavier cost of delivery. If credit is required, this will also add to the cost.

	Peruvian Guano.			Nitrate of Soda.	Sulphate of Ammonia.	Bone Meal.	Superphosphate.	Basic Slag.	Bone Compounds.	Special Manures.	Kainit.	Sulphate of Potash.	Muriate of Potash.
	Raw or Equivalised.	Phosphatic.	Dissolved (soluble).										
Ammonia, organic as in Guano and Bones	s. d. 15 0	s. d. 12 6	s. d. 15 0	s. d. —	s. d. 10 6	s. d. 12 6	s. d. —	s. d. —	s. d. 15 0	s. d. 15 0	s. d. —	s. d. —	s. d. —
" in Sulphate of Ammonia	—	—	—	—	—	—	—	—	—	12 6	—	—	—
" calculated from Nitrogen in Nitrate of Soda	—	—	—	13 0	—	—	—	—	—	—	—	—	—
Phosphate soluble in water	2 0	—	2 0	—	—	—	2 0	—	2 0	2 0	—	—	—
" assimilable	1 3	1 2	1 3	—	—	1 2	—	—	1 3	1 3	—	—	—
" insoluble	—	—	—	—	—	—	—	1 3	—	—	—	—	—
Potash (pure)	4 0	4 0	4 0	—	—	—	—	—	—	4 0	3 10	4 0	3 1

N.B.—The above table is based on the commercial cost of the fertilising constituents. Agricultural value is not always synonymous with the commercial cost, and every farmer must exercise his judgment, while considering the cost, which fertiliser may be expected to give the most profitable return on his soil and for his crops. This is the cheapest manure for him.

Approximate Unit Cost of the Nutritive Constituents in Feeding Cakes and Meals.

June, 1906.

Cakes and other Feeding Stuffs.—In order to be able to form a correct opinion of their value, it is necessary to know the relative cost of the different nutritive constituents. The following note, by an eminent authority, supplies this information. By reference to it, a farmer can calculate out the approximate commercial value of a cake or meal, and then use his judgment as to which is most suitable for his special requirements.

	s. d.
Albuminoids	2 8 to 3 0
Oil or fat	2 8 " 3 0
Carbohydrates	1 1 " 1 2

NOTE.—Most authorities in England are agreed that the value of each per cent. of unit of albuminoids and of oil is at least $2\frac{1}{2}$ times that of 1 per cent. of unit carbohydrates. If, therefore, the percentages of albuminoids and oil in a feeding stuff be respectively multiplied by $2\frac{1}{2}$ and added to the percentage of carbohydrates, the total feeding units contained in the article are obtained. The cost of the feeding stuff divided by this total of feeding units gives the price per unit. Example: A cotton cake contained

	Per cent.	Feeding units.
Albuminoids	22.1	$\times 2\frac{1}{2} = 55.2$
Oil	5.2	$\times 2\frac{1}{2} = 13.0$
Carbohydrates	33.2	$\times 1 = 33.2$
Total feeding units	...	101.4

The price of the cake being £5 7s. 6d., the cost per feeding unit was just about 1s.

Note to Regular Subscribers.

We may remind our readers that we are prepared to analyse free of cost for our regular subscribers, who are farmers, and not in trade as vendors of fertilisers or feeding stuffs, samples of minimum lots of 2 tons of either article, in cases where there is solid reason to suspect an attempt to defraud. The analyses are published, under a *nom de plume*, in the paper.

We are also willing to publish replies in these columns to inquiries relating to the quality and use of fertilisers and feeding stuffs.

Soil Suitable for Bone Meal.

It has been proved by numerous experiments that bone meal is most suitable for soils deficient in lime, and its benefit is much increased by the addition of sulphate of ammonia, or admixture with some form of organic mineral fertiliser, such as Peruvian guano, fish guano, meat meal, &c.

In what manner the ammonia serves to develop the fertilising activity of the bone meal has not yet been ascertained. Experiments are now being made to elucidate the matter, and it is probably due to the agency of bacteria in some form or other.

Value of Dead Leaves.

The necessity of preserving the dead leaves to form humus should be strongly insisted on. It has been proved by Grandeau and Henry, two of the Navy professors, that besides serving as food for earth-worms and other organisms, the rotting of which keeps the soil porous, friable, and superficially rich in nutritive mineral matter, dead leaves fix atmospheric nitrogen to the extent of 12 to 20 lb. per acre annually. To deprive an orchard or garden of its dead leaves is like robbing a farm of its dung.

Nitrate of soda contains nitrogen equal to about 13½ per cent. of ammonia. Sulphate of ammonia contains about 2½ per cent. of ammonia. To convert nitrogen into its equivalent of ammonia multiply the nitrogen by 1.2. Thus 10 per cent. nitrogen is equal to 12 per cent. ammonia.

Conservation of Farmyard Manure.

Experiment made by the late Dr. Voelcker showed that 5 tons fresh farmyard manure are reduced to 4 tons if allowed to lie until the straw is half rotten; 5 tons are reduced to 3 tons if allowed to ferment till it becomes "fat or cheesy"; 5 tons is further reduced to 2½ tons if completely decomposed. Bulk for bulk, well-rotted manure is rather stronger than fresh manure, but that slight concentration is obtained at the cost of the weight, as above, and corresponding loss of nitrogen. Chemical analysis has shown that 5 tons fresh farmyard manure contain about 40 lb. nitrogen, and that the nitrogen is greatly dissipated during storage, until when completely decomposed it has lost about one-half of its most valuable constituent.

It is therefore best to use it fresh when possible. Professor Massey, of the American Agricultural Department, writes on this point:—"The place to rot the manure is the soil where you have the soil to absorb everything." He advocates the use of manure applied to the soil, and says that evaporation does not take away much more than the water, and that the manure spread on the surface acts as a mulch. He gives an instance of the successful application of fresh manure to the surface of a heavy clay, thus—"Last summer was the hottest, driest, ever known here, but it was pleasant to see how things grew and flourished. I use all manure as a mulch, either on garden or field. It is spread over the surface, and left there to slightly work in during cultivation."

German experiments prove that there is little practical use in employing chemicals, such as kainit, superphosphate, gypsum, &c., to fix the ammonia in manure, the cost being greater than the benefit obtained. The general conclusion arrived at is that excessive loss during storage can be best avoided by storing it in a deep mass in a water-tight dungstead placed in a well-shaded situation, in which the material is firmly compressed. The most convenient and effective way is by treading of cattle.

"Keep it moist, and heal it tight,
It will well your care requite."

The use of a considerable quantity of moss litter is strongly recommended. This substance not only absorbs and retains the liquids but tends to fix the ammonia.

Fertilisers for the Wheat Crop.

When a farmer has an ample supply of farmyard manure, and can spare a moderate dressing of about ten loads per acre for his wheat land, it is not necessary to apply artificial in the autumn; a small dressing of $\frac{1}{4}$ cwt. nitrate of soda broadcast in spring if the crop appears backward will suffice. Similar treatment is appropriate if the wheat crop follows a well-dunged root crop or a good clover crop. Under other circumstances, if the grower has no spare farmyard manure—it is often better to reserve this valuable material for potatoes or the root crop, then an autumn application of fertilisers is valuable, and a good dressing is 2 cwt. of superphosphate mixed with 1 cwt. of good Peruvian guano, or fish meal. Potash is not generally regarded as necessary for the wheat crop, but on very light lands half a cwt. of sulphate of potash might with advantage be added to the mixture. Two cwt. of kainit would do equally well, but kainit, unless dry and powdery, is not so suitable for mixing with the other materials.

Potash and Clover.

The advantage of a good clover crop does not cease with the harvest, but remains conspicuous through the rotation. "Were all the merits of red clover in a rotation of crops emblazoned in letters of gold on a large canvas, it would fail to convey to the mind a full estimate of its true value."

How, then, can a good crop be grown? This is the problem Mr. J. J. Willis discusses in his booklet, "Value of Potash for the growth of the red clover crop as indicated by the Rothamsted experiments and as a preventative of clover sickness."

Potash, he shows, to be the dominant requirement of the plant by the fact that a crop of 4 tons of clover hay contains 62 lb. of phosphoric acid and 180 lb. of potash. He gives illustrations and figures demonstrating the great effect of potash in combination with phosphate of lime on clover, and shows that it has been found to be a preventative of the mysterious disease, clover sickness, the origin of which has puzzled scientific men for so many years. The booklet is published by the Potash Syndicate, 110, Strand, London, who, we understand, are willing to supply copies free on application.

Bunt Ball.

It has been calculated that in a single bunt ball—no larger than a grain of wheat—there are about 4,000,000 spores, each of which is capable of causing one wheat plant to be smutted. In a bushel of wheat there are 800,000 to 1,000,000 grains. There are, therefore, in a single bunt ball enough spores, if regularly and evenly distributed, to provide each grain in a bushel of wheat with four to six spores. The great necessity for removing or breaking the bunt balls, so that whatever fungicide may be used can act upon their contents, is obvious.

Indian Wheat Crop—Cheap Fertiliser Required.

According to a cablegram from Lahore, the Indian Government has ordered experiments to be made immediately, with a view to obtaining a cheap fertiliser. The Indian wheat crop, which covers several million acres, is not at present manured, and it is declared that it could be doubled if cheap nitrates were available. It is proposed to utilise the superabundant power of the Kashmir hydro-electric installation to manufacture nitrate of lime on an enormous scale, in the manner invented by Danish chemists, and now being tried in Norway. The Kashmir hills in many places consist entirely of limestone.

The best solution of the problem would be to grow leguminous crops, and thus obtain the required nitrogen from the atmosphere.

Lucerne for Hill-sides.

"It is rather a significant fact," remarks the *Farmer's Advocate*, "that those who object most strongly to lucerne, on the ground that it interferes with rotation, are, in not a few cases, men who grow two or three crops of grain in succession from the same field. Lucerne is not recommended to displace clover. Clover should be grown on all the cultivated land in short rotation, bringing it in at least once every four years. The lucerne should be considered an extra supply of fodder, and should usually be grown on the rough, hilly lands unprofitable to cultivate. Being a nitrogen gatherer, it rather improves the land it grows on, especially if a little ashes and possibly bone-meal, are used on the lucerne piece from time to time. When that land is ploughed out of lucerne it will be more productive than when originally seeded down. Meantime, the manure made by the stock that consumed the hay will have gone to enrich other parts of the farm. We know no other means of building up a hilly farm that will compare with the plan of seeding the hill-sides to lucerne and feeding the hay or green crop to stock. Lucerne for steep hill-sides is one of the best ideas that has ever been introduced into agriculture.

The price of sulphate of ammonia is gradually advancing, but is still relatively considerably cheaper than nitrate of soda. The unit of ammonia in it costs about 10s. 6d., whereas its equivalent in nitrate of soda costs 13s.

Prices of Fertilisers.

As the season for the purchase of fertilisers is now at hand, we shall give weekly for the next few months the London prices of the principal articles.

The quotations are approximate and free-on-rail, London, cash payment.

Nitrate of soda prompt delivery	£ s. d.
" " " " " forward "	11 17 6
Sulphate of ammonia	12 15 0
Superphosphate 26 percent.	2 10 0
" " " " " 35 " " " " " "	3 6 3
Pure dissolved bones " " " " " "	5 7 6
Bone compound ordinary " " " " "	3 8 9
Ground hoof, 15 per cent. " " " " "	9 10 0
Fish guano, 9 per cent. " " " " "	5 17 6
Knit " " " " " " " " " " "	2 5 0
Sulphate of potash " " " " " "	10 0 0
Muriate of potash " " " " " "	9 0 0
Basic slag, 30 per cent (ex works, Mid-lands) " " " " " "	1 13 0
Ditto, 38 per cent. " " " " " "	2 3 0

The best fertilisers are of little use unless the soil is in a suitable condition to enable the plant to utilise the plant-food they crave. The soil should be in fine condition, and porous; neither too dry nor too wet.

The number of samples sent to the State laboratories of Belgium during 1905 was 34,430.

BIBBY'S "CREAM EQUIVALENT" MEAL

FOR
CALF-REARING.

Our Agents are continually hearing some such remarks as: "I want you to send me two more bags of that 'Cream Equivalent' Meal. It is fine stuff, and I should like you to see my weanling calves; they are a splendid lot—a perfect show."

We like to hear talk like this, and do not wish for a better advertisement of this Meal than these "Cream Equivalent" reared calves are all over the country.

It is quite easy to prepare. It swells out into a fine creamy substance, the calves are fond of it, and there is no scour.

When the calves begin to eat, we recommend a little dry feeding—a mixture of "Bibby" Cake, Oats and Bran is particularly suitable, the former being at once nutritious and digestible; and calves so reared are always one of the sights of the farm, and make fine well-grown heifers with nice loose skins and plenty of good hair.

One cwt., costing 15/-, carriage paid, is enough for two calves. It costs about 1/3 more to rear a calf on "Cream Equivalent" than on the cheaper calf foods, while the difference in value of the grown animal is most marked, both as to condition, health, and growth.

It is the most soluble Calf Meal on the market, and can be made up simply by soaking the meal in cold water for six or seven hours, if this suits the feeder's convenience better than by making up with boiling water in the ordinary way.

If you are interested in this subject, write for our new circular, "How to Rear Calves for the Dairy." It will be sent free of cost to any address on receipt of postcard.

STATE AID TO HORSE-BREEDING.

The conference which took place at the Board of Agriculture on the last day of October as the natural outcome of the resolution passed by the House of Lords in July last was a most important one. A mere glance at the names of those who, in response to the invitation of Lord Carrington, met him on the occasion would alone be sufficient to make this certain. They represented most of the horse-breeding societies as well as the Royal Agricultural Society, the Irish Department of Agriculture, and several chambers.

Although not open to the Press or public, the fact is perfectly well known that the measures which have repeatedly been urged on former Governments, whereby farmers might find it profitable to breed cavalry remounts, formed the chief topic of debate. This was tolerably sure to be the case with Sir Walter Gilbey, Mr. Mr. Henry Chaplin, the Duke of Portland, and the Earl of Coventry present to take part in the proceedings, but whether the Government can be induced to buy young horses after being bred by farmers at three years old remains to be seen.

To do so would necessitate a considerable dip into the National Exchequer, or the scheme would no doubt have been adopted long ago. But the sum required, although large, would fall infinitely short of what the Government expends to encourage horse-breeding in Ireland, and what is "sauce for the goose" ought to be "sauce for the gander."

The conference was the result of the following resolution which the Earl of Donoughmore induced the House of Lords to pass:—"That in view of the importance of the horse-breeding industry to the community in general, and of the necessity of having an adequate and efficient supply of horses for military and other purposes, it is desirable that steps should be taken to improve the breeding of horses by giving effect to the recommendations of the Royal Commission on Horse Breeding in their tenth report, especially by those having reference to the improvement of the quality of brood mares."

The latter part of this resolution, it will be seen, went beyond the main principle of making horse-breeding more popular, and the inducements whereby farmers more generally would be inclined to make it one of their leading industries. Of course it depends a great deal on the character of the mare as well as the stallion as to what the foal will be. His Grace of Portland has had ample proof of this. After allowing his tenants the use of his high-class Thoroughbred stallions for several years' their outcome of progeny at the Welbeck Shows seemed so unsatisfactory owing to the bad influences of mongrel mares, that he determined on a scheme of action whereby his farming tenants could have the right sort of mares on hire. They had the good sense to respond to his generous offer to be the provider of as many as they chose to have, with the gratifying result that they now breed half-breds of good quality.

But "first catch your hare," quoth Mrs. Glass in her cookery book, and it will be time enough to deal with the question how to improve the quality of farmers' remounts after we have got them. At present there are very few indeed, simply because brooding them has long since failed to be a profitable industry. There is a very general opinion that it might

be made so if the Army agents were empowered to take them off the hands of farmers at a much earlier age than they do now. If the recent conference should lead to any practicable results, action presumably will be taken on these lines.

The reports of the Royal Commissioners, no doubt, suggest other schemes. In a very early report after their appointment will be found a lament that the Thoroughbred stallions they were able to place at different stations all over the kingdom were by far too few to be very effective for good. But when they made it, the unprofitableness of the industry and the disinclination of farmers to have anything to do with it had not been so fully apparent as it is now if the Premium stallions available for service at low fees were made fifty or a hundred times as many, it would probably have little effect so far as inducing farmers to take up with half-horse breeding. Horse-breeders who are not tenant farmers get the chief benefit from the service of Premium horses now, and this would be the case however much they were multiplied, unless indeed the scheme first adverted to were established along with it. If the industry were made a paying concern more stallions would, of course, be wanted.

The President of the Board of Agriculture has consented to distribute the medals and certificates to the students of the agricultural classes carried on by the Monmouthshire County Council at Chepstow on December 7.

A valuable consignment of middle-weight Yorkshire pigs was shipped from Liverpool on Saturday last to the order of Mr. Alex. Bruce, of Buenos Ayres. The pigs were selected from Sir Gilbert Greynall's well-known Walton herd, and are of the usual high-class breeding to be found at Walton Hall, Warrington. A very good young boar from the Duchess of Newcastle's herd was also included in the consignment.

At a meeting of Norfolk landowners held at Norwich, it was unanimously resolved "That, in the opinion of this meeting of landowners in the county of Norfolk, the Land Tenure Bill now before Parliament is opposed to the best interests of good agriculture, and that it is calculated to destroy the existing good relations between landlord and tenant, and that it will seriously impair the financial credit of the tenant farmer, and that it will deprive the labourer of any prospect of becoming the occupier of a small holding."

Notes of the Week.

Verily, the man who seems to "boss the show" — to use an expressive, if inelegant term — in this country is the Chancellor of the Exchequer.

The Irish people want facilities for extending the cultivation of tobacco, the experimental growth of which has proved successful.

The Chief Secretary for Ireland is willing, but appears helpless, and the Prime Minister, when, appealed to, says that the application should be addressed to the Chancellor of the Exchequer.

So again, when the Government is asked to encourage the introduction of the sugar beet industry, it is the Treasury Office that bars the way.

Similarly in the important Army meat contract question, the President of the Board of Agriculture and the War Minister would be willing to give our soldiers the benefit of British-fed meat, but the Chancellor wants to show an economy.

A paper economy only. Parsimony would be a better name, because it has been clearly demonstrated that, regarded from the point of view of the whole country's interest, it is not economy, but a "penny wise and pound foolish policy."

The other ministers should not bow the knee so humbly, but should press demands for legitimate and profitable expenditure with more persistency.

Cider is a favourite beverage with many people, and much more would be consumed if the public had confidence in its quality.

But it is known that enormous quantities of chemicals are substituted for the juice of the apple; only recently a man was fined for selling cider containing five grains of a deleterious acid to the pint.

Under the newspaper report of the case appeared an advertisement of — soothing syrup; a very necessary dose after drinking such a chemical mixture, misnamed cider.

The influence of light on the growth of plants is well known. Extraordinary results are being obtained by the exposure of plants to the rays of electric lamps. In Austria the system is passing out of the experimental stage.

It has also been demonstrated that electric currents passed through the soil in proximity to seeds stimulate them to earlier growth and maturity.

Covent Garden Market was treated to an unusual sensation one day last week.

"Would you like some money?" asked a mysterious stranger of a porter, and then forthwith handed him £100 in £5 bank notes.

Afterwards the philanthropist proceeded to dis-

tribute largesse in the shape of £5 notes and sovereigns in a manner most gratifying to the astonished recipients.

Who could he be? It was thought it might be the noble owner of the market distributing cash as conscience money for the wealth obtained from the market.

Or that it was in pursuance of a "freak" bet. We've all heard of the man who made a wager with a friend that it was not possible to sell genuine sovereigns in the street for a penny apiece. And he was right. His friend stood on London Bridge and offered sovereigns for a penny apiece; the passers-by thought it was a "freak," and would not take the bait.

It turns out that the mysterious stranger was a Mr. Yate, of Blackburn; but the why and wherefore of his action have not yet been explained.

A portion of a carcase of a diseased pig offered for sale was so remarkable and disgusting that it is being preserved for exhibition at Cambridge University.

It is thought that it can successfully compete against some of the Chicago diseased animals. Chicago would be easily first in quantity, if not in malignity of disease.

Are the Opposition acting with the wisdom of the serpent in trying to obstruct on pedantic grounds the progress of the Land Tenure Bill?

It may be possible to delay it, but it is bound to pass, and in view of the general feeling among farmers in its favour, the efforts of the Opposition should be directed not to end, but to mend it where desirable from their point of view.

Farmers in the country are watching the proceedings, and will not forget them when the time comes round for recording their vote at the next General Election.

In the "good old times," less than a century ago, there was a tax on salt of 15s. per bushel of 56 lb.

In the year 1818 this was reduced on salt used for agricultural purchases to 2s. 6d. per bushel or £5 per ton, and a farmer wishing to make experiments with it, had to give a formal certificate to the excise officer before he could get a supply.

In that year the Highland Society offered two prizes of the value of 30 guineas to the persons who should make and report the best and most satisfactory experiments in the effects of salts as a manure, and in feeding and fattening live stock.

How would farmers to-day like to pay a tax of £5 on salt. Such "old times" are only rendered good to our imagination by the halo of sentiment.

tary inspector said it was diseased, yet there appeared no blood in it. What was the disease?

(e) I also had some alomade beef I made in tins, and mould formed over it and I had to destroy it. Was this due to disease? If so, what disease?

November 2, 1906.

Answer: It is unfortunate that your series of questions leave very much to be desired in the matter of detail, and had more information been furnished it would have been possible to have answered them more fully.

(a) For example, you should have told us the name of the contagious disease that occurred in the building to render disinfection necessary. In the case of any scheduled disease, that is, any disease dealt with by the Board of Agriculture under the powers conferred on them by the Diseases of Animals Act, 1894, the business of disinfection is none of yours. Section 22 (v. and vi.) deals with powers for prescribing and regulating the destruction, burial, disposal, or treatment of carcasses, fodder, litter, utensils, pens, hurdles, dung, or other things, and the cleansing and disinfection of infected places and areas, or parts thereof, and the inspector has to attend to it. Perhaps your are taking too much on yourself. In any case, it is desirable that we should know the nature of the disease that has occurred in the stable, and also what is included in the term "utensils."

(b) The same remarks apply here. It may be the business of the authorities, and in any case something depends on the character of the infection or contagion. Caustic lime may be of some use, but ordinary whitewash plastered on indiscriminately is simply covering up the pathogenic

THURSDAY, NOVEMBER 15.—Penistone Ploughing Matches—Carmarthen Pig Fair—Crews Horse Sale—Sale of the Dunsford Underwoods, Surrey.

FRIDAY, NOVEMBER 16.—Agricultural Fairs at Lincoln and Yeovil—Crews Shire Horse Sale—Entries for Chippenham Cattle, Cheese, and Poultry Show to be sent in.

SATURDAY, NOVEMBER 17.—West Malling Fair—Andover Cattle and Sheep Fair—Horsham Cattle Fair—Warsop Fair—Bedford Cattle Fair—Lampeter Fair—Huntingdon Cattle Fair.

MONDAY, NOVEMBER 19.—Welshpool Cattle, Sheep, and Pig Fair—Truro Cattle Fair—Entries close for the Wadhurst Fat Stock Show.

TUESDAY, NOVEMBER 20.—Aberavenny and Carmarthen Agricultural Fairs—Wirksworth Cattle Fair—Entries to be sent in for the Chichester Fat Stock Show—Entries of Bristol Fat Stock Show to be sent in.

matter. Limewash is not without its utility, but it is not a disinfectant in the proper acceptance of the term, and it is probably not greatly improved by the addition of carbolic acid of an impure variety.

(c) Carbolic acid, and particularly the impure forms generally employed, is practically valueless. Smith says:—"The chief thing in employing carbolic acid is to use it strong enough. Only a certain amount is soluble in water; a saturated solution of the pure crystals gives a solution containing 8 1/2 per cent. of phenol, but the impure acid sold for disinfecting purposes is by no means so soluble. This is owing to the tar oils it contains, and it is believed that these latter are without any disinfecting properties. A saturated solution of ordinary impure carbolic acid only yields 3 1/2 per cent. of phenol, which is less than is necessary for the destruction of the spores of resisting microbes. This point should be borne in mind in dealing with anthrax or tuberculosis." Carbolic acid is by no means the best addition to limewash or for a washing-down solution. What would be most suitable brings us again to the question of what was the disease?

(d) It is not possible to diagnose a disease from the bald statement that "the liver of the cow was full of black spots." It is difficult to understand what the sanitary inspector had to do with the matter, unless he also acts in the capacity of meat inspector, and in that case you should have asked him to give the disease a name.

(e) That mould formed over your tinned beef was due to imperfect cooking, curing, or preserving. Disease would not cause it, and even if it was due to disease the fact of its going mouldy would not enable us to diagnose it. The most awful stuff in the way of flesh, diseased, decayed and rotten, can be so preserved as to mask it, as witness the recent revelations in the Chicago horrors.

With further reference to the disinfection of the stable, which we do not understand had any connection with the cow with the spotted liver, we could perhaps help you better if you tell us all about the case.

M.R.C.V.S.

VETERINARY.

Advice of a Veterinary character, by an M.R.C.V.S., is offered to Readers entirely free of charge. Particulars of cases should be addressed to the Editor, "MARK LANE EXPRESS," 3, Wellington Street, Strand, London, W.C.

Ruptured Colt.

SIR,—I am much obliged for your vet's reply to my question. Corroborating what I have been told is reassuring to one inexperienced in this matter (from such an authority), as to its yet righting itself by waiting on time and nature. If in case it should become chronic or permanent do I understand rightly that it can be operated on successfully by the process he describes to be known as the covered operation at castration?—Yours, &c.,

November 9, 1906.

CONSTANT READER.

Disinfecting Stables.

(b) How would you prepare the limewash and how much fluid carbolic would you put in it—say, to a bucket of limewash?

(c) How much carbolic should I put in a bucket of hot water for washing down?

(d) Last week I killed a cow, and the liver of the cow was full of small black spots. The sani-

CATTLE.

Notes and Jottings.

THE season ever since the beginning of July has in many parts of the country been a very expensive one with cattle. The ability to maintain a full supply of milk was quite impossible without resorting to outside means—that is, outside the pasture; then to produce beef was an equally difficult question, so that the year has been a very expensive one to the cattle keeper, this merely mentioned in passing on to what is commonly called, and rightly so, the expensive time of the year when the most economical way of keeping our herds in the condition that best suits them is the one important question. Just simply to buy and use the extraneous food that can be bought at the lowest price is frequently false economy. There are many features that enter into the cost in addition to prices of food (artificial) that has to be decided upon.

ONE of these questions is the keeping of the animals in the condition most suitable—that is, with the milking cow the outside feed, as we will for plainness of speech call it, must be such as at a moderate price will keep up the condition and health of the cow as well as the flow and quality of her milk; and in order to do this it must be manifest to everyone that a mixture of various kinds of food is much better than an over-

docks or the cornedales, or from some source or other; it is less trouble than grinding my corn at home, and I can save a bit in hard cash in addition." It is quite worth considering whether a mixture of home-grown corn, such as wheat, barley, oats, and beans or peas, with, perhaps, a little maize, which is generally bought at a fairly cheap rate, is not better than any other extraneous food that can be bought, and there is very little doubt, too, that the meals from these home-grown English, Irish, Welsh, or Scotch cereals is not of much greater value than that produced from purchased corn grown in foreign lands.

IF a little home-produced corn meal of mixture be set to steep in water, the water poured over it when at a boiling temperature, and a little foreign grown meal is set alongside, the difference in the two after standing twenty-four hours will hardly be credited by those who have not tested it this way. With all foreign purchased meals there invariably appears a certain amount, often very great, of indigestible matter, made up by mixtures of grain from bad samples, cheaply-purchased oats or barley, which often fill the receptacle used for this testing, with a lot of husks that contain no feed of the slightest value, and when used frequently upset and derange generally the system of the animal. Home-grown corn used in

cattle trade, bullocks in forward condition being now much in request, and, where well bred, are being cleared off at a good figure. Eightpence a stone or a penny per lb. in the price of beef gives a great impetus to the store trade when forward cattle are being handled, and there is fully that difference at the present time when compared with the prices that ruled in many parts of this country and Ireland during the continuance of the drought and before the markets assumed their brighter aspect. We have long thought that the time would come when English beef—or, rather, perhaps we ought to say British beef—would have a proportionately higher value than imported, and it appears probable that, with the reports upon the tinned meats and other matters affecting the imported product, home grown will shortly take the lead much more extensively.

THE Galloway Cattle Breeders' sale at Castle Douglas proved rather a slow occasion as regards prices, yet the sale of a collection of animals from Sir R. W. B. Jardine's herd, which was disposed of by Messrs. Harrison and Son at Lockerbie, realised very fair prices, indeed, what may be termed encouraging; 40 guineas was realised in one instance, whilst 38 guineas in another, and 30 and over in several others, with a general average of £20-3s. 6d. for forty-two head, leaves a much pleasanter recollection behind it. The Galloway is one of the oldest really Scottish breeds, and as such is of great value for crossing where Blue Greys are concerned, whilst where it is desired to keep them in their prime state, and quality has been kept in view, the steers are easily fattened into acceptable and profitable weights. Gentle treatment is very essential in this breed, and an eye for quality and symmetry, which invariably go hand in hand, will help considerably.

THE American State Fairs continue to give very good results in every way. The quality of the several breeds of cattle exhibited appears to be, to say the least of it, of a very satisfactory description, whilst the number of visitors not only assists the gate very largely but also proves how very much the people appreciate the opportunity given them to learn something of these different breeds, not only as to their capabilities of growing and producing milk and meat, but also as to the manner in which they are brought out. A very important difference will at once be observable by the youngest and least experienced person in the fair grounds between those specimens that have come from herds properly cared for and those where little attention, insufficient good food, and slovenly management have obtained.

IN mentioning this we do not do so entirely with a view to encouraging farmers and others all round to exhibit their cattle. The show yard has a profitable side to it as well as an adverse side, so those who have well bred animals that they wish to dispose of, say that keep regularly an up-to-date pedigree herd, will very frequently find the showyard the most economical way of advertising their young stock. It may not always follow immediately upon a show or fair. Many an observing person, when he sees animals that suit his taste from a herd, it may be a new one or an old one, if it pleases him he is pretty certain to take a note of that breeder's address from the catalogue, and when he requires an animal or two of the breed writes the owner simply from having seen a sample or example of his stock in the showyard.

NO, it is not altogether on account of the showyard that this is mentioned, but rather with the view to pointing out to farmer visitors who are not well up to bringing out their animals in show form that the same difference obtains in the way their animals are brought out for the ordinary fat stock market or as stores that obtain in the showyard. Let the fat sample be brought out ripe, trimmed a little of their rough hair at top of tail, also a little hair cut off the end of their tails or—as they are more commonly called—switches makes a great difference to their appearance on the market, and gain the buyers' eye is a great matter in the first instance—a peep that attracts often leads to a closer examination that ends in a deal. It must not be forgotten, however, by the new beginner or inexperienced person that the tails of store cattle should never be cut.

RETURNING once more to the American shows, how it strikes one that more attention is not paid to some of our other British breeds of stock. There appears to be right few animals of any breed exhibited except the Shorthorn, Hereford, and Angus. Americans will probably in time learn how very much better some breeds, even of our little known varieties, suit certain districts than do others. When this important lesson has been learned it is quite likely that several of our other breeds will be run upon, as we choose to call it, or boomed. There is undoubtedly throughout the vast expanse of territory in the Western Continent, as well as in Australia

GUERNSEY BULL, MERTON SIGNET.

Corn May 20, 1904, sire Rueben 2nd, 1416, dam Signalman, 4647; bred by and the property of Mr. F. Hargreaves, Merton Grange, Gillingham, Cambs. At the Royal Show at Derby this year Merton Signet was the First Prize winner in the class for Guernsey Bull; calved in 1904.

dose of any one kind. These fools, in order to be healthy for the breeding and milking cow (and this is of primary importance), should not be strongly astringent or too relaxing, neither should there be anything contained in the food likely to set up irritation—common cotton-seed cake has frequently been found to do this very seriously; therefore where this valuable food is desired to be used for breeding stock the softest deoecated one only should be used.

ANOTHER point that springs up in this economical matter is the manurial value of the foods given. When food is used that as a high manurial, fertilising value as well as assisting the animal, it is much more to be valued than the one-sided menu which only caters for the animal. When poor farmyard manure is used it either requires supplementing largely with artificial of some kind, or otherwise the corn crops produced will be "quarters per acre" often short of the crop grown from fat rich manure, whilst in the case of roots and other green crops there will often be 50 per cent. better or worse, according to the quality of the farmyard manure that has been used for them. By this it will be seen how important a consideration the manure is, therefore the food used should have a high manurial value if they are to be really economical.

ANOTHER point yet in the practice of herding keeping economy may be mentioned, that is the preparing of these artificial foods for the animals. Frequently we hear farmers say, "I sell all my corn and buy cakes, or meals from the

mixture has more frequently been found the greatest economiser all round, and if a little well-ground linseed or cottonseed cake is added the manure will be much increased in value.

ONE more note whilst upon this subject. That is as to whether the meals and cakes used should be given dry or made moist either by steeping or boiling. This is a point that will probably depend largely upon the time of the year, upon the kind of fodder that is being used, and upon the supply of roots available. Up to Christmas prudence would dictate a dry diet whilst there is often a little grass to be had in many places, and whilst there is a good supply of cabbage or mangold tops or other green stuff of this kind available, and whilst the fodder still retains a good deal of nutriment; but when the spring months come in and the fodder is dried by the sunny and windy dales that prepare the seed-time, then it will be found that half or a large portion of the artificial corn would give a much better return if boiled or steeped and used that way, and more especially would this be the case when roots are running short.

THE brighter prospects in the beef market have quickly made their effect felt in the store

SIX FEEDS FOR ONE PENNY—International Stock Food—is the Best Food for Cattle, Horses, Sheep, Pigs and Poultry.—Write for full particulars to F. C. SOUTHWELL & Co., Ltd., 75, Southwark Street, London, S.E., or the Local Agents.—(ADVT.)

and New Zealand, many districts that would suit, perhaps, the Sussex, the Devon, or the Welsh much better than they do the at present more popular breeds. Americans, like other nations, may live and learn.

Sale at Aberdeen.

The last sale of pure-bred cattle in the north of Scotland for the present season was held at the Agricultural Hall, Kittybrewster, on the 1st inst., when there were catalogued 19 head of Shorthorns—16 bulls, 1 cow, and 2 heifers—and 58 head of Aberdeen-Angus—24 bulls and 34 cows and heifers. In the case of both breeds the quality was of a very mixed description, and the demand was purely local. The top price for Shorthorns was 38 guineas, paid by Mr. Copland, Milton of Ardlethen, for the heifer calf, Lost Chord, belonging to the Rev. W. A. Spark, Banchory. The two-year-old bull Swaziland, belonging to Mr. Davidson, Baluss, Mintlaw, was sold at 35 guineas to Mr. Garland, Ardlethen. Ten bulls averaged £20 2s. 1d., and one yearling heifer under £11 0. 6d.

In the case of the Aberdeen-Angus, trade on the whole was fairly good for the character of the stock offered. A considerable number of the animals were immature, and for these there was practically no demand. The top individual price was 35 gs., paid by Mr. John Rae, Mountbush, Rosehearty, for a very pretty, evenly-fleshed, yearling heifer, Floweret of Tochnieal, belonging to Mr. George Bruce. The only Erica sold was a yearling bull, Black Eric, belonging to Mr. Macdonald, Allanquhich, and it went to Mr. Booth, Downiehill, Peterhead, at 28 gs., whilst at 29 gs. Mr. Paterson, Tillykerrie, got a Pride of Aberdeen two-year-old bull, Probation, belonging to Mr. John Fowlie, Loanhead, New Deer.

The average per head for the thirty-nine Aberdeen-Angus was £18 4s.

Transactions in Store Stock.

(Reported to the Department of Agriculture and Technical Instruction for Ireland.)

Gort Fair, co. Galway, was held on November 7. Average-sized fair, composed chiefly of second-class cattle. Demand fairly active, but a good many unsold. Calves, second class, £3 15s. to £4 10s.; yearlings, second class, £6 10s. to £7 17s. 6d.; third class, £3 10s. 3d. to £7 7s. 6d.; two-year-olds, second class, £5 to £11; third class, £6 to £7 10s.; three-year-olds, second class, £11 5s. to £12; Springers, second class, £11 15s. to £15; third class, £9 to £10. Fair supply of sheep, for which there was a very good demand. Lambs, second class, £1 4s. to £1 14s.; over twelve and under twenty-four months old, first class, £2 8s. 9d. to £2 12s. 6d.; second class, £2 3s. to £2 8s.; two-year-olds and over, first class, £2 13s. to £2 15s.; second class, £2 10s. to £2 12s. Young pigs, eight to ten weeks old, for which demand was rather slow, sold at from 18s. to 22s. each.

Shropshire Sheep, &c., for Australasia.

Messrs. Alfred Mansell and Co., of Shrewsbury, shipped per *ss. Ajric* of the White Star Line, on October 31, to Melbourne and Sydney, a large and important consignment of pedigree live stock. The shipment, which established a record both in numbers and value which one vessel has carried to the Antipodes, comprised first-class specimens of Shropshires, Hampshires, Border Leicester, Lincolns, and English Cheviots, selected on behalf of several noted Australian breeders, and included on account of Mr. Geo. Simonds, of Tasmania, about eighty head (the whole crop) of the ewe lambs from Mr. John Harding's Shropshire flock, the purchase of which was effected by Mr. Simonds in December, 1905, some month or six weeks before the lambing commenced; also a large number (136) of shearling ewes, rams, and ram lambs, selected at the Ruddington and Norton dispersion sales.

The cattle section included the Aberdeen-Angus Erica bull Everall, m at the Derby R.A.S.E., from Mr. J. J. Cridlan's herd, and sired by the champion bull Wizard of Maisemore. Also a grand yearling Aberdeen-Angus bull, Rescovie, bred by Mr. Patrick Chalmers, sired by the Ballindallock bull Elshender (16523), from the noted Risca by Easterfield (12435). Both these animals are destined for Sydney, as also a beautiful yearling Devon bull, bred by the late Mr. A. C. Skinner, and accompanying these was a choice selection of Silver Wyandottes from the late Mr. P. L. Mills' prize-winning yard.

The King has decided to send his fat stock on the Royal farms at Windsor to the Slough Christmas cattle show and sale, which will be held on Tuesday, December 11. His Majesty's consignment will consist of about thirty prime Devon and other bullocks, 200 sheep, and 150 Berkshire and other pigs. The auctioneers will be Messrs. Buckland and Sons.

Notes and Jottings.

"He doth nothing but talk of his horse."
—"Merchant of Venice."

THE question was asked the other day, What has become of our Hacks? Hackneys we have in plenty, but where are the backs—the horses which it would be a pleasure to ride a journey of thirty or forty miles? Certainly we do not see them in the showyard, or very seldom. If we take the classes for so-called gentlemen's hacks at any ordinary show, the sort of horse that is shown would never be ridden by a man who wanted conveying with ease and expedition from one place to another. High action seems to be the only quality aimed at by breeders or recognised by judges, and it does not seem to matter whether a horse puts his foot out or not, so long as he puts his knee up to his chin. It is, I think, a pity that the riding qualities of the Hackney have been so much neglected during the last twenty or thirty years. The breed has undoubtedly suffered from it, and I am quite convinced that Hackney breeding would have been a more profitable industry than it is if the saddle horse had been taken into consideration a little more.

THOSE of us who can go back a few years can call to mind the excellent saddle horses that were shown in the classes for gentlemen's hacks, most of them Yorkshire Hackneys. I wonder how many of my readers remember that beautiful horse Sir George Wombwell used to show and win all over with. He was elegance itself, he moved with that beautiful elastic action, that is so charming, and he moved well in all his paces. He was indeed in every sense of the word a gentleman's hack, and though he stood out as one of the best of his kind, there were plenty like him in his day. I am sure that if Sir George Wombwell should see these lines, he will agree with me that where there were any number of good hacks in the days when his famous horse was to the fore, there is scarcely one of the type to be found in the length and breadth of the land.

THE typical gentleman's hack of the present day as exemplified in the showyard is more or less of a harness horse. Very frequently he has heavy, if not exactly badly placed shoulders, his head has to be carried by his rider, he is heavy in the neck, and though he moves well according to the modern standard of action, he is what is called, and rightly called, a bone setter. Many of my readers can recall horses that they have seen winning time after time in the show ring, which, however good they might be in their place, were certainly out of place with a saddle on their backs. In fact, the way that many of them are bitted, and have to be bitted to make them show themselves, is sufficient proof that in a class for gentlemen's hacks they are out of place. A horse that has to be ridden in a "pull devil, pull baker" bit, and that takes hold of it and puts his head in his chest, is no gentleman's hack, and no gentleman would ride him.

THERE are classes at some shows in which the riding type is encouraged, and to Mr. J. H. Stokes is due the credit of initiating these classes. Broadly speaking, the conditions are for horses not more than 15 hands 2 inches in height, built on hunting lines, and they are always judged by the hunting judges. Some excellent saddle horses are shown in these classes, but taking them on the whole they are undersized hunters, which is something different from the hack I have been speaking of. It seems needless to say that the horses we see shown in the classes of Covert Hacks, or Park Hacks, are decidedly not of the type I am speaking of.

BUT though these gentlemen's hacks are so much fewer in number than the type is seldom seen in the show ring, especially amongst the prize-taking division, there are still some to be found, and there would, I believe, be still more shown if a different standard of judging were adopted. During the last two or three years I have seen certainly half-a-dozen fine saddle horses shown, but I have seldom seen them amongst the winning lot. One I certainly saw win, and a very fine horse he was, with that light airy action and elegant carriage which is so rarely seen nowadays in a class for gentlemen's hacks.

NOW the horses I have been speaking of were all Hackney bred ones—and none of them were over 15 hands 2 inches high. And in my travels amongst Yorkshire studs I have occasionally come across horses of the same type. The number of such horses in many enthusiastic Hackney breeders' herds in season and out of season that the Hackney is the harness horse of the future,

To a certain extent this may be the case, but most decidedly the Hackney is something more than that. His great reputation rests on his qualities as a saddle horse rather than as a harness horse. Phenomenon, for example, is painted in the saddle. And though a great mistake has been made in breeding exclusively for harness, and in endeavouring to breed over the normal height, by which I mean to breed horses over 16 hands for harness purposes, it is not too late to get the old type back. I am sure there are plenty of us who would be only too ready to buy such horses as used to be common thirty years ago, horses standing from 14 hands 3 inches to 15 hands 1½ inches, that could carry themselves, that could put their foot out as well as snap their knee, and that it was a pleasure to ride fifteen or twenty miles out and home. Nor when they were tired were they bad harness horses, though it certainly does spoil a saddle horse a little to drive him.

A HORSE that is much driven is apt to go "on his head" when ridden. This has been attributed by some to the collar; but really in ordinary single harness work the pulling against the collar is only light by comparison, and I should feel inclined to put the heaviness in hand which is so often experienced when riding a horse that has been much driven to the bad and heavy hands of the driver. My reason for forming this opinion is that I have in my time ridden several horses that have been driven a great deal. Two of these had been driven in single harness only, and no man need wish to ride better or pleasanter hunters. And one of them, a mare, had her neck set on a little the wrong way up. Yet she carried herself beautifully, with her head quite in the right place if you left her mouth alone. If you did not—well, she ran away or did something equally unpleasant. Now, she had always been driven by men with good hands, and I think she is a fair proof of the correctness of my theory.

TO return for a moment to the question of re-establishing Gentlemen's Hack classes on the old lines: I think this might easily be done. First of all, there should be the height limit of 15 hands 2 in. at the outside; secondly, a horse that appears in "a pull devil pull baker" bridle should, *ipse facto*, be disqualified; thirdly, a horse's carriage of himself should be a great factor in awarding the prizes; fourthly, the way in which the shoulders are used should be considered of much more importance than the snap of the knee, and finally, the judges should be riding men, who would get up and ride. Need I say that it is necessary for a gentleman's hack to have a nice swinging canter. It is not necessary that he should gallop.

ON Wednesday next Messrs. Walker and Sons will sell in the Salutation Yard, Doncaster, the whole of the late Mr. A. J. Brown's Hunters. Of these there are forty-one, including his famous show horses, some of which were in winning form as recently as the Great Yorkshire Show at Middlesbrough. Mr. Brown's name as a judge and owner of high-class show horses is too well known to require any comment here, and Messrs. Walker will show such a lot of Hunters as rarely come into the ring at one sale. The Doncaster sale will only be second to that at Leicester, when the whole of Mr. J. H. Stoke's stud was disposed of a few years ago.

IT is not often that I differ in opinions on anything relating to horses and breeding from Mr. T. F. Dun. He is a man of wide experience, and his knowledge of Polo and Polo ponies is admitted to be exceptional. But I cannot see that there will be any benefit derived from his proposed alteration of the rules referring to the admission of Polo ponies into the Stud Book. He would admit any pony whose sire or dam was registered, and he would raise the height from 14 hands 2 in. to 15 hands. But then the pony would disappear. There can be no doubt that there are many cases of hardship under the present rules, but where hard and fast rules have to be made there always will be individual cases of hardship, and by raising the height the cases of hardship will not cease, they will only be moved. It may be argued that under the present rules there were many ponies that are just above the height that would be a great acquisition to the Polo pony Stud Book. It is also a matter of knowledge that there are ponies registered at Hurlingham which have grown since they were measured, and that are now nearer 14 hands 3 in. than 14 hands 2 in. On the face of it these facts present an anomaly, and the contingencies are difficult to provide against, and certainly raising the standard a

couple of inches does not seem to be the best way of preserving and improving the Polo pony.

THE LOOKER-ON.

Stone in Horse's Stomach.

DEAR SIR,—I send you a photograph of a stone measuring in circumference 24 in. by 23½ in. and weighing 11½ lbs., which was found in the stomach of a cart horse seven years old that had worked on a farm in Dorset.

The cause of the illness of the animal was for some time a mystery to the veterinary surgeon in attendance, and it can be readily understood that the presence of so large a stone was sufficient reason for its death. The stone is at present in the possession of my father-in-law.—Yours faithfully,

R. M.

November 8, 1906.

Mr. Clement Keevil's Shires.

A good company attended at the Blagdon Stud Farm, three miles from Leighton Buzzard, on Wednesday, when a draft from Mr. Clement Keevil's Shire stud was disposed of. The day was not particularly favourable for outdoor sales, but fortunately the rain kept off. The proceedings were somewhat delayed from the fact that the luncheon tent was blown down by the gale of the preceding night.

Good but not high prices were obtained, a total of 1,819 guineas being obtained, which gives an average of £45 14s. 6d. for the forty-two animals sold.

The best of the brood mares was the four-year-old Blagdon Victress, a recent prize winner, sold to Mr. Hanbury for 77 guineas. The foals were by

Mr. R. W. Hudson's Shires.

Mr. R. W. Hudson was decidedly unfortunate as regards the weather experienced for his Shire sale on Thursday, for it rained practically throughout the day, and must have had some effect on the sale. Still it did not prevent a very large attendance of buyers, and all the well-known breeders of Shire horses were either present or represented. The catalogue comprised forty-one animals, consisting of ten mares, nine foals, fifteen fillies two and three years old, and seven yearling fillies and colts. The Dunsfield Shire horse stud are so well known that we need not enter into details concerning it. All the young prize-winning fillies recently exhibited from the stud were included in the sale, and also some choice mares. A large proportion were by

mark of the foals, but with the exception of the 200 guinea animal the brood mares did not sell so well as expected, and somewhat lowered the average, the next best figure to the 200 guineas being 72 guineas. Still, all things considered, it was a most satisfactory sale.

The Berkeley Stud.

The late Mr. Alfred Day's famous stud of pedigree Hackney ponies was sold by auction on Wednesday at Crews by Messrs. Munley and Sons, and, as was only to be expected, the sale drew a large company of breeders from all parts of the country, and keen competition took place for the possession of some of the animals. Bidding was specially animated for the pony stallion champion Fireoly, a bay foaled in 1898, which won first and champion honours at the London Hackney Show. The bidding was between a gentleman buying for exportation to the United States and Mr. Price, of the Lyndhurst Stud, the latter securing the animal for 460 guineas. Mr. Washington, of The Hague, bought the pony mare Naughty Naid for 120 guineas; Mr. Sease, of Chestow, secured the pony mare Miss Sniff for 100 guineas; Mr. Jones, of Bourn Hall, gave the same figure for Berry Hill Sniff, also a pony mare. Mr. Ash, of Birmingham, purchased another pony mare for 70 guineas, and a yearling filly, Berkeley O'Read, for 85 guineas. Mr. Miller, of Glasgow, gave 80 guineas for the yearling filly Berkeley Sniff; Mr. C. Jones, of Sheffield, bought the pony stallion Berkeley Royal for 130 guineas, and Mr. Foster, of Melvalley, bought the pony stallion Berkeley Belgravia for 105 guineas. The following, from other owners, were also sold at this sale:—Mr. Cunard's pony champion, Queen Go Bang, 300 guineas; Mr. Ainsworth, of Waterloo; Mr. Robinson's bay pony stallion Pinderfield's Inglesby was bought for 185 guineas by Mr. Edmondson, of Stretford, who also purchased Lord Ruby, a bay gelding, for 120 guineas; Finstall Monarch, a chestnut stallion, went to Mr. Ferguson, Macclesfield, for 135 guineas; and Sunset, a black mare, was purchased by Mr. Lawson, Manchester, for 95 guineas.

Sale of Lord Lonsdale's Hunters.

Included in the catalogue of Messrs. Warner, Sheppard, and Wade's sale at Leicester on the 3rd inst. was the Earl of Lonsdale's stud of Hunters. All had been regularly hunted with the Quorn, the Cottesmore, and the Belvoir Hounds, and they were for sale because Lord Lonsdale expects to visit South Africa this winter. There was keen bidding for their possession, no better lot having been offered for sale this autumn, and five of them averaged over £205 each, the top price, 280 guineas, being paid for Lovely Mary, a brown mare by Castleton, and bred at Lowther by Lord Lonsdale. Swagman, a stylish grey gelding by May Boy, reached 250 guineas. Minstrel was sold for 200 guineas, and Black Prince, a son of Red Prince II., for 150 guineas. The steeplechaser High and Mighty, with which Lord Lonsdale won the Quorn Point-to-Point Steeplechase in 1905, did not change hands, but an offer of 45 guineas was accepted for the smart 12 hands 2½ in. pony Fox.

Shire Horse Society.

Sixty-six new members were elected at the council meeting of the Shire Horse Society, held on Tuesday.

The Editing Committee reported that a list of sixty-eight prefixes and one affix had been submitted to them, and they recommended that the applications should be granted with the exception of one, they referring back the prefix "Fylde" as being too comprehensive. In two other cases they decided that "Merry," being a registered prefix, could not be used by another owner in respect of his mare "Merry England," and they again affirmed their decision that a prefix registered by a non-member could not be re-allotted until the lapse of five years.

Prizes in 1907.

Sir P. A. Muntz, Bart., presented the report of the Horse Show Committee, indicating that 39 gold medals had been awarded at 33 shows and 225 silver medals at 217 affiliated shows, the breeders' prizes under each scheme totalling—Gold medals, £125 in twenty-five sums of £5; silver medals, £190 in 160 sums of £1. The committee recommended that the schemes in force in 1906 should again be continued under similar conditions, with one proviso to meet the delays experienced owing to some secretaries not lodging, in accordance with the committee's request, the official awards at their shows, viz.:—That all awards must be completed within six months of the date on which the medal was awarded, otherwise they will be void.

The dates of the London Show would be February 26 and three following days, while in respect of the schedule of prizes the committee did not think it desirable to introduce any alteration in the 1907 list, so that the sum of £2,180 would be offered in class prizes, in champion and

PHOTOGRAPH OF A STONE, WEIGHING 11½ LBS. TAKEN FROM A HORSE

a capital lot of twelve, and they averaged £36 6s. 3d. each, as against £52 16s., which was paid for each of the brood mares; but the top price of the sale—105 guineas—was paid by Mr. Turner for Blagdon Armour Plate. The yearling fillies averaged £43 15s. each, Mr. Holford paying 45 guineas for Blagdon Freedom, while Mr. Turner went to 66 guineas for Conquest.

The following were the prices realised:—

BROOD MARES AND FOALS.

Hendre Hydrometer, and showed the Prince Harold characteristics in a marked degree; others were by such well-known sires as Birdsall Menestrel, Birdsall Calamint, Blaisdon Conqueror, Redlynch Paxton, Buscot Harold, Mere Duke, Bury Victor Chief, Royal William II., Prince Harold, &c. This year Childwick Champion was hired from the Tring stud, and most of the mares were covered by him or by Traitor, Stonewall Lad, or Dunsfield Chief.

A good demand was experienced for all the animals, and the forty lots were disposed of in less than two hours at an average price per head of over £86. The best price of the day was got for one of the two-year-old fillies, namely, Dunsfield Feathers by Birdsall Menestrel. There was keen competition for her, Lord Rothschild's representative being amongst the last bidders, but Mr. F. G. Muntz outstayed all, and at 450 guineas this choice specimen of the breed was knocked down to him. He also gave the next highest price, 200 guineas, for the brood mare Tutton Tapestry, by Royal William II. Lord Rothschild's representative gave 175 guineas for the two-year-old filly Dunsfield Fashion, by Hendre Hydrometer; Dunsfield Kit, by the same sire, was secured for the King at 160 guineas; whilst Sir Alex. Henderson gave 140 guineas for another of that sire's gets—viz., Dunsfield Confidence, a two-year-old filly. Two other three-figure prices were recorded—namely, 120 guineas given by Earl Egerton for Norman Emerald and three-year-old filly by Royal Bendigo, and 115 guineas for Dunsfield Royal, a yearling colt by Beachendon Royal Harold, Mr. Lambert being the buyer. The yearling fillies went up to guineas, a similar figure being the high water

prize cups, including seven classes for stallions, seven classes for mares, and three classes for geldings. The committee felt it desirable to add a note to the regulation as to the brood mares—viz., that a certificate of foaling must be deposited not later than October 1, 1907, to ensure the confirmation of the award. The committee recommended that the auction should start each morning (Thursday and Friday) at 10 o'clock. The show would close on the Friday at 4 p.m., so as to enable purchasers to get their animals away by an early train.

This report having been adopted, Mr. Hamer Towgood drew attention to the conditions contained during the past two years by the regulations relating to brood mares, as he thought it was rather a mistake to allow an animal to take the prize and receive the ribbons when she was subsequently disqualified owing to her inability to comply with the conditions of the class. He would prefer that they should revert to the old state of affairs, or perhaps the committee would institute a class for barren mares, though this alternative would not get out of the difficulty entirely, but he did not wish to press it for the coming show, and he thought that the Horse Show Committee might think the question over.

Mr. Snow Fordham agreed with Mr. Towgood, as he thought it was a ridiculous position. He felt that the chance of receiving the ribbons was an inducement to send a mare, as it was not difficult to say if a mare was in foal in February; while even if she could not comply with the conditions she took the ribbons, and was sold by auction or privately as if she were in foal, and this was, to his mind, very unsatisfactory.

Sir P. Albert Muntz suggested that the society's veterinary inspectors should be called in, in cases of protest to determine the question of the mare's compliance with the class regulations. It was decided to refer the question to the Horse Show Committee for further report.

Mr. C. W. Tindall also raised the question of the wording of Rule 24, and said he considered that the disqualifications should include the use of soap as well as that of resin, as in his opinion soap, when used for other than washing purposes, had become a greater nuisance than resin, and that nothing should be used except sawdust. After a short conversation the matter was referred to the Horse Show Committee.

LONDON SHOWS AFTER 1907.

The Chairman presented to the council the report of the Shire representatives who attended the conference between the four societies and the representatives of the Royal Agricultural Hall and of Olympia. It was unanimously decided to adopt the report providing for the holding of the society's shows after 1907 at the Royal Agricultural Hall, favourable terms for rental and accommodation having been successfully negotiated.

ROYAL SHOW AT LINCOLN.

Mr. John Rowell, in moving the renewal of the society's offer of gold medals and their accompanying breeders' prizes for Shire horses at the 1907 Exhibition of the Royal Agricultural Society of England, asked the indulgence of the council to add to this offer a grant amounting to £70, to be applied to the provision of classes which the Royal Agricultural Society of England were anxious to place in their schedule. These classes were three—viz., yearling fillies, prizes £15, £10, £5; colt foals and filly foals, prizes £10, £6, £4 respectively. Mr. Rowell said that the Royal Society were unable, owing to financial considerations, to offer the prizes, and he thought that this society could not do better with the money at their disposal than to encourage the Royal Show by providing them. Last year the amount was raised by private subscription.

Sir P. Albert Muntz supported the proposals, and said it was suicidal on the part of the breed societies not to support the Royal Society, as the existence of that show was of enormous value to the breed societies in this country. The grants by this society would confer great benefits on Shire horse breeders; he did not think it fair to expect private individuals to continue the contribution initiated last year, and it was more dignified that the money should be given by the Shire Horse Society. At the same time, he felt that when the Royal Society was more flourishing they would see their way to provide these classes.

Mr. A. J. Hollington said that he thought the question of this grant should be referred to the Horse Show Committee, but Mr. Rowell said they were practically settling the Lincoln schedule to-morrow.

It was finally resolved, on the motion of Mr. Taunton, seconded by Mr. Edward Treason, that the amount suggested by Mr. John Rowell—viz., £70—should be offered to the Royal Agricultural Society of England to be applied to the three classes mentioned.

The council then adjourned to their meeting in Smithfield week, Tuesday, December 11.

Hackney Horse Society.

Meetings of the council and committees of the Hackney Horse Society were held at the offices,

12, Hanover Square, London, W., on Wednesday, when twenty-five new members were elected.

It was resolved to complete the prize list by adding a class for best pair of ponies under 14 hands, any age, prizes £10, £5, £5.

MEDALS.

It was reported that during the past year the following medals had been awarded at the various shows:—Eleven gold medals (in hand), twenty-five gold medals (in harness), 190 silver medals (in hand), twenty-nine silver medals (in harness). And it was resolved to offer gold medals at the following foreign shows:—Paris, Brussels, The Hague, Spa, Buenos Aires; silver medals at various shows in South Africa, Canada, United States, and other parts of the world.

Two gold medals will be offered as champion prizes for Hackneys at the Royal Dublin Spring Show, one at the Highland, and three at the Royal show, Lincoln.

It was represented that the prizes at the International Show at Olympia next June for Hackneys and harness horses would be exceedingly liberal and far in advance of any prize list yet presented in this country. It was resolved to offer eight gold medals in the various Hackney and harness sections at the International Show. Various details as to purchase of extra photographs, &c., were attended to, and Baron Schroeder reported that he had been elected chairman of the Show Committee during the ensuing year, and Mr. Arthur E. Evans vice-chairman.

Mr. Darby, chairman of the Editing Committee, reported that the committee had considered at great length an objection which had been lodged with the society against the entry of the pony stallion Morton Swell, which was awarded the first prize in the two-year-old pony stallion class at the last Hackney Show, and first prize at the Royal Show at Derby. It was alleged that the pedigree of this stallion's dam as presented to the society was incorrect. The committee had examined several witnesses and had resolved to refuse the entry of Morton Swell and his dam, Black Cornflower, and in consequence to cancel the award at the London Show. The further steps which will be taken by the society in the matter will be reported at a later date.

The entries of 10735 Brown Sall and her produce were cancelled and expunged from the Stud Book, as the signature to one of the certificates under which she had been registered was proved to be false.

The committee also considered at considerable length the question of the registration in the English Stud Book of horses bred in America descended from English parents. Under the society's present rules no horse bred beyond the United Kingdom can be entered in the Stud Book, but as various horses descended from English registered stock had been brought to this country from America by Americans domiciled in England, the committee decided to go into the matter, and take the best legal advice as to the society's position.

PRIZES AT THE ROYAL SHOW.

It was resolved to contribute a sum of £50 towards the class prize for Hackneys at the Royal Show at Lincoln in addition to the usual champion gold medals.

PLACE OF SHOW.

The committee appointed to interview the Agricultural Hall Company and the directors of Olympia reported they had made tentative arrangements with the Agricultural Hall Company to continue the shows at Islington for a further term of seven years on terms very favourable to the society. The accommodation which the Hall Company had agreed to provide by the enlargement of the ring, the provision of extra seating and boxes, and other improvements, would be greatly to the advantage of future Hackney shows.

CONFERENCE.

A report was presented as to the transactions at the recent conference with Lord Carrington on horse breeding at the Board of Agriculture. The society's representatives thereat reported that the conference dealt entirely with Thoroughbred and Hunter stallions without any reference to Hackneys.

The next meeting was fixed to be held on February 6, 1907.

Replying to a deputation of Essex yeomen and tenant farmers on the Land Tenure Bill at Westminster on Tuesday, the President of the Board of Agriculture (Lord Carrington) said he felt much encouraged by the fact that the views of the deputation coincided with the support given to the Bill by farmers in other counties. He hoped the measure would commend itself to Parliament as at least an honest instalment towards the settlement of some difficult questions which called for solution, and he hoped it would pass through both houses as a good, honourable measure, designed not to prejudice or injure any good landlords, but to protect tenants in hard cases such as sometimes occurred,

HEARSON'S CHAMPION INCUBATORS

During the years 1904 and 1905 Hearsen's Incubators were tested at the University College, Reading, with other hot-air machines, the result being that each year Hearsen's Incubators hatched the highest percentage of eggs reovied.

Norwich, Norfolk.

Notes and Jottings.

SOME of the Flock Book Societies are evidently not satisfied that their methods of marking sheep are all that they should be, and are taking steps to make them more effectual. It was stated at one meeting that a member knew there were cases where dealers had bought a few registered animals, mixed them with some unregistered ones, and sold the whole as registered. It is surely the duty of a flock book society to look into such matters, so that such cases could not recur. Marking, if carried out properly, would go a long way in this direction, but the unscrupulous may adopt methods of their own. Where a member is certain that there is dishonest representation he should report it to the society, and a thorough inquiry be made, followed by a prosecution should it be proved clearly that misrepresentation, and consequently a fraudulent sale, had been made.

SOME few years ago a farmer was fined £500 and narrowly escaped imprisonment for substituting an animal for a pedigree Shorthorn, thereby getting a higher price than he otherwise would. Representing sheep to be registered when they are not is on all fours with this case, and it is made worse when a man deliberately purchases a few registered animals so as to be able to palm off a number of others as being what they are not. It would be worth while for the societies who suspect that there is this illicit use of their rights being made to take steps which would bring about a conviction.

THOSE with ample grass run for their sheep have had a pleasant time lately than those who have been obliged to keep theirs on arable land, for the pens have been very dirty. It is doubtful if all recognise how much it takes out of sheep to have to constantly carry several pounds weight of dirt. It is certain that all do not observe every opportunity to relieve sheep from the incubus. A certain amount of dirt on the belly-wool can scarcely be prevented in bad times, but filth behind can be cleared away. Nothing indicates the laxity of the master and the carelessness of the shepherd more than filthy hindquarters. The scour itself frequently comes for want of better management, though it is frequently charged to the natural condition of the food; still that is only a partial excuse, as good feeding would provide something astringent as a corrective to stop the scour. At this time of year when many of the roots have not matured, there is admittedly unusual difficulty in keeping the bowels in order, and especially so when the wet weather makes the food over succulent, and also tends to chill the sheep. It is essentially a time for the use of dry food.

THE wool trade hangs fire, prices have given way in most classes, but not in a sensational degree. There is a long way to go before another clip is obtained, and though holders may be disappointed at not getting the top prices, they may console themselves that had all thrown their clip on to the market at shearing time the price would soon have been as low, or lower, than it is now. The prolonged summer has probably had some effect on the trade demands, and as pronounced a winter would not be without its influence in the other direction. There is a general feeling of confidence in spite of the slow demand up to the present, and sellers are as slow to move as the buyers.

WE are getting into near distance of the Christmas sales, little as the mild weather may seem to suggest it. If the mutton trade is not exceptionally bright just now, it is a satisfactory one, for prices are such as show a fair profit on production; would that all other farm produce could do the same. The price of cereals suggests that they may be used with more freedom, though maize is a cheap competitor; these, however, are best fed as a meal with chaff. Cotton-cake is a suitable food for mixing with these, and its price is tempting, but it is highly important to give it in a finely-broken condition, especially so in the case of dearticulated.

LINSEED-CAKE is, proportionately, quite dear enough; in fact, a better feeding value can be got out of home cereals, maize, and cotton-cake than from linseed cake at the prices. Crushe's cottonseed with 20 to 25 per cent. of oil gave

feed, if genuine and free from cotton fibre is the cheapest article to use with cereals at present prices. It is important, however, that it is genuine. After so flush a growth as there has been of late, the cottonseed acts with beneficial astringency, and the large quantity of oil balances well with the less oily cereals.

LINSEED is such an easy food to handle that it is always popular, and as a single food has no equal, but the buyer always has to pay something for its popularity; still, in proportion with the price of mutton it is not an expensive food—it is the others that are a good point cheaper. If linseed cake alone is given it is dangerous beyond three-quarters of a pound per head per day; additional weight should be given in the form of one or more of the starchy foods, and beyond those mentioned lowest bean is exceptionally valuable for sheep. The wet weather calls for special attention to the stakes around the folds.

THE soil is getting so saturated that the stakes require to be driven well home otherwise the hurdles, notting, or whatever fencing may be used stands a very good chance of being knocked over. In stormy weather also sheep are apt to be wild and restless, so that at any time they may make a rush which will put a big strain on the hurdles. The weather is absolutely so mild that one scarcely recognises that the season for severe frosts is with us. Yet on November 14, 1879, the ground was frozen, and never thawed again until the second week in February. During this time hurdles and stakes were frozen in fast, and caused great inconveniences by limiting the quantity available. One extreme often foretells another of a decidedly opposite nature, and there is no telling how sudden a leap we may take into winter.

AT any rate, from now onwards, it will be well to be on the guard so that the temporary fencing is not caught. With the land so wet a comparatively light frost may be sufficient to get them frost bound.

Dorset Horn Sheep.

At the last council meeting of the Dorset Horn Sheep Breeders' Association the secretary read a communication from the Royal Agricultural Society with respect to the prizes at their show to be held at Lincoln in 1907. The secretary said last year the Royal Show had four classes, giving £10, £5, and £3 in each class, and the association also offered a champion prize of £10 for the best pen of ram lambs, shearing ewes, or ewe lambs. Now the Royal Society asked if the association would give the same champion prizes as last year, and, further, if they could see their way to giving the prizes for ewe lambs.

It was agreed that the same amount be voted to the Royal Society, on the assumption that they would maintain the classes as last year. Further, that the sum of £10 granted be divided into two sums of £5 each for the male and female classes.

The Bath and West and Southern Counties Society wrote stating that they could not provide classes for chilver lambs, for various reasons, and suggesting that the association should provide the prizes for a class for chilver lambs at the show.

Mr. Kidner considered that if they went outside the limits of the Royal Show they would not know where to stop, and would soon be in difficulties. He moved that the association could not see its way clear to contribute to the prize schedule of the Bath and West and Southern Counties Show, and the motion was agreed to.

The secretary alluded to the importance of members horn-marking their sheep, and spoke of an instance where, at a recent sale, a would-be buyer had refused to buy registered sheep that had not been so marked. Mr. Kidner expressed the opinion that no sheep of over nine months old should be considered as registered without the mark on the horns, and gave notice that at the next meeting he would move a resolution to this effect.

It was agreed to support a petition from the Federation of Lancashire Agricultural Societies, supported by other district agricultural societies and specialist clubs in England and Wales, to the Railway Clearing House Committee, asking that all exhibitors and officials attending shows be allowed to travel at a rate not exceeding a fare and a quarter for the double journey.

Mr. J. J. Cridlan has just sold his yearling bull Everall (24442) for exportation to New South Wales. He is an exceedingly well bred bull, being by Wizard of Maisenore (24465). Mr. Cridlan's prize-winning and champion bull (himself the son of the champion bull Elate) out of Evergreen 3rd and Trojan Erica cow of the famous Elboweiss strain, who has in her veins the blood of the champion bulls Equestrian, Justice, Young Viscount. Apart from breeding, Everall is an exceedingly well-grown, handsome young bull.

TAMWORTHS.

PEDIGREE TAMWORTH & LARGE BLACK
PIGS.—For SALE, at reasonable prices to
clear, Gilts, Young Boars, and Young Sows of
best breeding.—**FRANK SUGDEN**, Ruckley Estate
Office, Shifnal, Salop.

THE Melton Constable celebrated Herd of
Pedigree Tamworth Pigs. Prize winners at
Norfolk, Suffolk, and other shows. Champion
Cups Smithfield. Several recently exported for
Continental and Colonial herds.—Apply R.
OWEN GODDARD, Estate Office, Melton Constable,
Norfolk.

An egg-laying competition will be held from
December 1 to 31 by Messrs. Leonard Smith and
Co., Ltd., of 58, Bromsgrove Street, Birmingham,
who offer prizes of £20 in cash and other awards.
All the birds entered must receive once a week
some of Smith's ovary tonic, and it is to illustrate
the efficacy of that the competition is chiefly
promoted. Full details, entry forms, &c., can be
had on application to Messrs. Smith as above.

The Premier on Wednesday informed a Parlia-
mentary deputation who urged legislation to
facilitate small holdings in rural districts, that they
had his entire sympathy and he would be
disappointed if next session passed without some-
thing being done in the direction they desired.
He fully appreciated the importance of the sub-
ject, and added his confidence that any such
legislation would be entirely supported by his
party.

POULTRY.

Seasonable Advice.

The weather is a somewhat trying for those
last year's birds which have not their full plumage,
as they feel the occasional cold nights, and unless
fed on stimulating food and provided with com-
fortable covered runs, they stand moping about,
and look very miserable indeed. During Novem-
ber the birds require feeding well, and undoubtedly
the best breakfast for them is made of two-thirds
bacon meal and one-third good middlings
during the week at least, and the other two
mornings the birds may have middlings or barley
meal and house scraps.

The feeding of the birds is now an important
matter, and so much depends on how the birds are
fed as to the results obtained from them. There
are many good laying fowls which are not treated
in the right manner, and are therefore not as they
otherwise would be. During the cold weather the
hot breakfast is of great help to the fowls, as after
the long night they have been on the perch they
are very hungry and require a nourishing feed.
This is specially comforting to them when it is
hot.

Poultry-keepers on a small scale generally
utilise the house scraps for their fowls, but
these are not used to the best advantage when they
are thrown to the birds during the day. The
better way is to keep a bowl specially for the
house scraps, and as these accumulate they should
be placed in the bowl and kept until the following
morning, when the contents of the bowl should be
transferred to an old iron saucepan, which should
be kept for the purpose of boiling up the house
scraps. Sufficient water to cover these should
then be poured over, and the whole brought
gently to the boil.

When there are any pieces of bacon rind or any-
thing that is likely to cause a stoppage internally
they should not be allowed to eat the same; it is
good plan to cut these into smaller pieces before
they are boiled up. As soon as the mixture has
boiled it should be poured into the mixing bowl,
and sufficient middlings and barley meal added to
make it nice and crumbly.

Small poultry-keepers can profitably use their
house scraps in this manner, but where there is a
larger number of fowls kept, some substitute for
the nourishing house scraps should be provided,
as to produce eggs when the weather is severe and
really nutritious food is required. Fowls require
sufficient food to sustain them, and a surplus over
this to provide nourishment for the egg organs.

The best method of using biscuit meal to advan-
tage is to scald it over night by pouring boiling
water over it in a pail or basin, covering the meal
well with water, and then placing a linen cloth
over the top of the pail to keep the steam in. If
the cloth is folded several times the whole of the
steam will be kept in, and the meal will swell to
about twice its bulk when dry. Then next morning
some boiling water should be poured in
and the middlings added, and the whole well
stirred to make a crumbly, appetising meal for
the birds.

At this time of the year scraps of meat and fat
should be added to the fowls' breakfast, and the
pieces of bread and scraps of vegetables should be
boiled up for the fowls at midday. We have been
asked whether it pays to feed fowls thus well in
the winter months, and we have no hesitation in
saying that it pays well, as many more eggs are
produced by fowls thus well fed than will pay for
the additional cost of the food, and these extra
eggs are all profit, and in addition to the eggs the
condition of the birds improves, and they are not
made fat internally, as this food nourishes the
birds and helps the production of eggs—but
does not make fat.

It is time for fowls which are required to breed
table poultry to be mated now, and birds for the
production of exhibition stock should also be
mated during this month. These remarks refer
more particularly to the heavier breeds, as Leg-
horns, Minorcas, and Wyandottes are frequently
not mated until February, and then produce good
birds for the autumn shows.

Care should be taken to provide the stock birds
with plenty of ventilation in their houses, and not
on any account to overcrowd them. It is most
essential to the well-being of the birds that over-
crowding be avoided.

Those who keep birds merely for laying and
breeding table fowls frequently prefer to breed
from cross-bred pullets, as they are so hardy, and
when bred from good laying strains—so prolific;
and these birds, when mated with cockerels of
pure breeds suitable for the purpose for which
they are required, answer quite as well as the pure
breeds, and the cost of the stock is lessened.

During November and December the pullets
and hens which are to be kept for breeding pur-
poses should be sorted out from those which are
to be sold, and suitable male birds purchased for
them.

It is advisable to mate ducks now, in order to
secure early eggs and ducklings when prices are
the highest. It is a great mistake to put this off

until after Christmas, as in purchasing now there
is a good opportunity for the birds to get nicely
settled down before eggs are required.

DAIRY.

A Clean Milk Supply.

The report of the committee appointed by the
Royal Institute of Public Health to consider the
best means to ensure a clean milk supply to the
consumer was issued last week, and contains
a number of interesting and important
recommendations.

The committee state that in their investigations
they were struck with the necessity for taking
further steps for the prevention of milk-borne
diseases, and the similar necessity of improving
not only the quality of the milk itself, but also the
existing conditions under which the supply of
milk was carried on.

They recommend among other things better
ventilation, lighting, drainage, watering, and
flooring of farm buildings used for milk supply,
and suggest that in the general management of
a farm there should be a systematic veterinary
inspection of all cattle and the isolation of all
cows that show any symptoms of ill-health.

As to transit, the committee regard among
others the following points as essential to safe-
guard milk from contamination.—The sealing and
locking of all churns; all milk to be conveyed in
special vans, preferably refrigerating vans, the
vans to be so constructed as to remain cool whilst
at the same time the admission of dust is pre-
vented, and that proper platforms should be pro-
vided at the railway termini for dealing with the
milk, and no manipulation of milk should be per-
mitted except in a suitable depot, and only by
persons especially appointed for that purpose.

Agricultural Work at the Birmingham University.

Members of the agricultural and Midland press
had an opportunity on Saturday of looking over
the department of Economic Zoology which has
been opened in connection with the Birmingham
University, and of learning from Mr. W. E.
Collinge, M.Sc. (who is in charge) something of
the scope and nature of the work which the new
department is undertaking. Up to the present
time, most of the agricultural colleges have
principally cultivated the chemical side of the
work. Mr. Collinge prefers to approach it from
the biological standpoint, and so, while seven
Midland counties are to be served, there will be
no danger of clashing with either the Kingston or
Harper-Adams Colleges. The Birmingham depart-
ment is even now answering large numbers
of inquiries from farmers, fruit growers, stock-
breeders, nurserymen, and gardeners, who suffer
from the depredations of injurious insects, and
furnishing the most approved advice as to preven-
tive and remedial measures. In many cases when
an inquiry is received in the morning, Mr. Collinge
himself is able to be on the affected ground by
mid-day.

In explaining the purposes of the new depart-
ment, Mr. Collinge held up as a model of imitation
the United States Department of Agriculture,
with its staff of nearly 5,000, and its scientific
experts numbering more than 2,000. The Council
of the University of Birmingham, he said, intended
to set up a consultative department and bureau of
information and experimental work. It would
provide the agricultural market gardener, fruit
grower, and stock breeder with free information
as to the various animals which were injurious or
beneficial to crops and live stock; and so far
as the facilities of the laboratory per-
mitted, determination would be made of the organ-
isms causing any particular trouble, while de-
finite instructions in the preventive and remedial
measures to be adopted would be sent free
to those concerned. They would also be ready
to advise and confer with agricultural com-
mittees of the county councils, the Chamber of
Agriculture, or to attend meetings when subjects
relating to zoology were being discussed.

On the side of experimental research, attention
was being devoted to the breeding of insect
enemies of insect pests, such as the aphid-devouring
ichneumon flies, which had been sent with excellent
results into districts where the aphid blight
abounded. The working out of the life histories
of insect pests where they were doubtful, and the
trials of spray and similar remedies would also
form important branches of the work.

It was the first occasion on which a university
had offered such facilities to agriculturists, and he
was sanguine enough to believe that it would not
appear in vain to the county councils, who drew
so much from the heavily rated rural districts.

The seven Midland counties served by the
Birmingham scheme are Warwick, Worcester,
Hereford, Gloucester, Salop, Stafford, and
Leicester.

The Dogs Act, 1906.

The Board of Agriculture has issued a circular calling the attention of local authorities to the provisions of the Dogs Act, 1906, which will come into operation on January 1 next. In this the Board says:—

At the present time the wearing of collars by dogs is in force enforced in London and several other districts by means of regulations made under the Rabies Order of 1895, which exempt dogs wearing collars from the requirement of muzzling. In view of the provisions of the new Act the Board have made an Order, entitled the Dogs Order of 1906, the effect of which is to revoke all existing muzzling regulations as from January 1 next, and to enable local authorities to make regulations directly requiring the wearing of collars by dogs while in a highway or place or public resort. The regulations will not apply to packs of hounds, or to any dog while being used for sporting purposes, or for the capture or destruction of vermin, or for the driving or tending of cattle or sheep.

The local authorities are empowered to regulate, as well as prescribe, the wearing of collars, and will thus be in a position to extend the exemptions if they think fit. The order will not come into operation until January 1 next, but under the Interpretation Act, 1889 (section 37), it is competent for your local authority to proceed at once to make regulations to take effect on or after that date.

The Board have not in their order authorised local authorities to make regulations for preventing dogs from straying between sunset and sunrise, inasmuch as they think that the most convenient method will be for each local authority in Great Britain to consider what action is in their opinion necessary as regards their district, and then to state to the Board whether the circumstances render it desirable that these powers should be put into force in their district or in any part of it, and whether the restrictions should be in force throughout the year or during a part of the year only.

Any dog in respect of which an offence is being committed against the order may be seized as a stray dog, and the Board rely on the police authorities efficiently exercising these powers.

Agricultural Imports.

The following account shows the quantities of certain kinds of agricultural produce imported into the United Kingdom in the week which ended November 3, 1906. The quantities in the corresponding week of last year are given in parentheses:—

ANIMALS (living).—Oxen, bulls, cows, and calves (10,244), 8,501; sheep and lambs (650), 2,211; horses (385), 210.

FRESH MEAT (cwt.).—Beef (82,926), 109,895; mutton (68,684), 56,599; pork (11,335), 11,878.

SALTED OR PRESERVED MEAT (cwt.).—Bacon (91,254), 104,405; beef (1,784), 2,001; hams (19,664), 18,556; pork (2,877), 1,965; meat, salted or fresh (12,602), 13,055; meat, preserved (18,517), 7,937.

DAIRY PRODUCE (cwt.).—Butter (71,813), 71,227; margarine (22,545), 22,831; cheese, (68,533), 63,342; milk, fresh (—), —; milk, cream (146), 90; milk, condensed (15,763), 19,883; milk, preserved (32), 229.

EGGS (Great hundreds).—(448,166), 449,459; poultry (value £) (5,168), 5,676; game (value £) (3,946), 2,521; rabbits, dead (not tinned) (cwt.) (26,521), 32,162; lard (cwt.) (48,946), 38,869.

CORN, GRAIN, MEAL AND FLOUR (cwt.).—Wheat (1,628,500), 1,004,200; wheat meal and flour (316,600), 314,500; barley (869,500), 759,900; oats, (109,700), 327,100; peas (86,380), 46,460; beans (29,920), 40,200; maize or Indian corn (451,200), 677,800.

FRUITS, RAW (cwt.).—Apples (158,747), 144,882; grapes (49,994), 56,641; pears (9,613), 15,849; plums (240), 5,935.

G. P. MITCHELL-LEXNES, Secretary, Tredegar Estate Office, Newport, Mon.

LEEDS SMITHFIELD SHOW.

47th Annual Exhibition will be held in the Victoria Cattle Market Hall, December 11, 12, and 13, 1906. Cattle, Sheep, Pigs, Roots, Dressed Poultry, Butter, Poultry, Pigeons, and Rabbits. Entries finally close December 1, 1906. Schedules, now ready, may be had on application to the Secretary, **H. KITCHEN**, 3, Wormald Row, Leeds.

Agents, Situations Wanted.

WANTED, AGENTS for the SALE of NATURAL Ammoniacal and phosphatic GUANOS and high-class Chemical Manures. All analyses and dry condition guaranteed.—Apply to **DANIEL DE PARS & CO.**, 1, Fenchurch Buildings, Fenchurch Street, London, E.C.

AGENTS WANTED in Districts where unrepresented by **W. R. SMITH and SONS**, Bone Manure Works, Tattenhall Road Works, nr. Chester.

SITUATION WANTED as ESTATE

S FARM BAILEIFF, thoroughly experienced in all branches of farm and estate work; fourteen years in present situation as bailiff of nearly 2,000 acres, under James Forrester, Esq., the resident agent to Viscount Portman's Dorset estate; excellent references.—Apply, **J. K. BESEST**, Bryanston Farm, Blandford.

RE-ENGAGEMENT as FARM BAILEIFF (working) wanted. Experienced in cultivation of land including hops and management of Stock, dairying and poultry. Daughter good butter maker. References of 12 years, 6 years, and 2 years in last situation on a home farm, which has been let. Strongly recommended.—Apply to Messrs. **WOODMAN, SONS & PARKS**, Estate Agents, Hastings.

RAILWAY ANNOUNCEMENT.

POULTRY and PIGEON SHOW, to be held at the **BINGLEY HALL, BIRMINGHAM**, DECEMBER 1 to 6, 1906.

NATIONAL DOG SHOW, to be held at the **CURZON EXHIBITION HALL, BIRMINGHAM**, DECEMBER 3 to 5, 1906.

THE LONDON AND NORTH WESTERN RAILWAY COMPANY have arranged for the conveyance of Poultry and Pigeons to be sent to Birmingham (New Street Station) on **FRIDAY, NOVEMBER 30**.

Consignments from the Branch Lines, and from Oxford, Cambridge, &c., will be placed in these Vans at the various junctions.

Conveyance rates can be obtained at the various stations on the Line.

Arrangements will also be made for the return of the traffic in **THROUGH VANS** direct from Birmingham at the close of the Shows, and Exhibitors are requested to order their consignments "Per London and North Western Railway."

The Company's Representatives will be at the Show to answer all inquiries. All information can be obtained from Superintendent of the Line, Euston Station, London, or from the Company's District Superintendent, New Street Station, Birmingham.

FREDERICK HARRISON, General Manager

MOLASS FEED.

Invaluable for mixing with Chaff for all kinds of stock. Cheaper than Bran or Millers' Offals, and by analysis pronounced to be **50 per cent.** better. Only pure Cane Molasses used with Corn and Vegetable products as an absorbent.

AGENTS WANTED.

Manufacturers:

**R. TOWNSEND & CO., LTD., ROYAL CAKE MILLS
STROUD.**

**THE SETTLER'S IDEAL HOME
NEW ZEALAND**

Arrangements have been made with the Shaw, Savill & Albion Co., the New Zealand Shipping Co., and the Federal Steam Navigation Co., for **REDUCED FARES** for 2nd & 3rd Class Passages. At the present time reduced rate passages are limited to Farmers, Agricultural Labourers, Shepherds, Wood Cutters, and men able to milk cows and manage live stock, who, if approved, must take £25 with them. Domestic (Women) Servants will be granted passages at the reduced rates subject to their taking with them not less than £2. For application forms and further information apply to the High Commissioner for New Zealand, 13, Victoria St., London, or the Agents in the United Kingdom of the above Shipping Companies.

A Pain or a Strain made Right again

When your horse is in pain through a wound or a strain you won't find anything to equal **Pond's Remedy**. It is safe, sure, and speedy. It checks hemorrhage, contracts the skin, heals it, destroys germs absolutely, and purifies the severest wound. **Good for Cattle, Dogs, and all Domestic Animals.**
Pint Bottles, 2/-; Quart Bottles, 3/6; Gallon Bottles, 10/6.

Filling the Springs. A WAY back in September, when the land had the appearance of dying through thirst, pessimists wondered if it would ever rain again, but optimists felt sure it would if we only waited long enough. The optimist proved to be a true prophet, and since the long drought broke up we have been inclined to grumble at having rather too much rain for personal convenience. But the rain was wanted, and we have satisfaction in knowing that the empty springs are being filled up and the earth replenished with moisture. In some parts floods have been the order since November came in, and we have recently seen expanses of country turned into a lake, with only trees, haystacks, and hedge-tops showing, which a couple of months ago was as bare and as parched as a desert. In the midst of the dowfall, too, Jack Frost has not made his presence felt, and grass is as vividly green as we ever see it in the spring. It is well that we have no hand in the ordering of the weather, for Dame Nature is working things round for the general good.

Falling Leaves. A SUBJECT of general comment this season is the tenacious way in which leaves have stuck to the trees and retained their verdant hue. Appearances in September gave the impression that the leaves would fall early and quickly, but the rain seemed to give them a new lease of life, and early in November many trees, notably oaks, looked fresher than they did two months before. One of the bright spots in dull November is the glorious colouring of ripened leaves, which no artist can portray quite faithfully on canvas. But the display nears its end, for as we write the fields before us are white with frost, which has loosened the leaves, and they are pattering to the ground in showers. Without the mould formed from decayed leaves gardens would be at a loss for suitable soil for potting purposes, and though the fallen foliage of trees does not play such an important part in the operations of the farmer, still he can make some use of leaves. In wooded districts cottagers and small holders are not slow to collect up dry leaves and utilise them in the pigstye. There for a time they serve the purpose of bedding, and as they rot down they assist in adding considerable bulk to the manure from the piggy. Many lessons can be learnt from the fall of leaves, which is nature's own way of manuring, and as the ripened foliage rustles mournfully to the ground, it carries with it plant foods and material to improve the mechanical condition of the soil and sustain the vegetation that will burst into new life next spring.

Working and Supervising. WE know some men who farm considerable areas of land, and are in a sound position financially, who work from morning to night at manual labour, perhaps harder than any labourer they employ. Their idea is that by working themselves in this way they save the wages of a labourer or perhaps two, and their example is an incentive to the other men to do more than they might otherwise. We know other men in similar positions who do more in the way of supervising than actual working, and the point at issue—which of the two is the better off at the end of the year? Personally, we think that in the case of a large farm the saving of a few shillings a week in dispensing with a labourer by doing the work oneself is false economy, and far more than that can be saved by acting as general supervisor and overlooking the work of the whole establishment. By this we do not mean to say that a farmer should ever be, as it were, at a loose end, and we know that many a man has gone under through being habitually away from his work and his farm, spending too much time at markets, &c., and sacrificing his own interests for the sake of sport and amusement. The farmer who succeeds is he who is generally to be found at home looking after the work, though not necessarily doing it himself, unless he is in a small way, and then it is to his interest to keep down the labour bill by putting his own shoulder to the wheel.

Bred in the Bone. IN looking through the reports of ploughing matches and hedging and ditching competitions that have taken place recently we have observed how in many cases fathers and sons in the same family have figured as competitors and also prize-winners. In these days when there are so many complaints about the deterioration of agricultural labour, this kind of thing is encouraging, because it shows that there are some sons who are following in the footsteps of their fathers and developing into skilled workmen. We are inclined to think that the matter is largely in the hands of the father. If the latter is a good workman himself, he naturally wishes to see his sons excel also, and he spares himself no pains in training them in the work at which he is an expert. While this sort of thing goes on, the standard of expert farm labour will be maintained; but, unfortunately, there are too many men who have no ambition to excel themselves, and care nothing about the education of their children either in scholastic matters or manual processes. Our admiration is for the type of man who is a first-rate ploughman or hedger or shepherd himself, and if his son grows up to be more expert, he is not jealous, but feels a sense of

paternal pride and satisfaction that he has brought up the lad to follow in his footsteps and become a better worker than himself. We wish there were more working-men of this stamp, and then there would be no need for fears as to the deterioration of agricultural labour.

The Force of Habit. THE force of habit is very strong in human nature, and if habits of the right sort are acquired at an early age they have an excellent way of sticking in after life. A friend of ours who is a small farmer, and has several growing lads, has strong ideas about this, which he demonstrated to us in a practical way the other day. In the first place he gives each of his boys a strip of garden ground for his own, and takes no excuse if the plot is allowed to get untidy. He has no need to complain on this score, for there is a spirit of competition between the lads, and the father argues—rightly, we think—that this is a means of teaching the boys at an impressionable age to be methodical and tidy, and to become interested in cultivation. He further encourages the lads to keep pets, such as rabbits and pigeons, because he intends them to be farmers, and consequently wishes them to become fond of animals and acquire habits of attending to the latter and feeding them regularly. To some such lessons may appear elementary, and perhaps old-fashioned, but they strike us as being excellent ideas for educating youthful agriculturists.

Village Life in Winter. WHAT is described as the deadly dullness of village life in the winter is sometimes given, rightly or wrongly, as one of the causes of rural depopulation, and various attempts are made to provide the youth of country villages with amusement and recreation during the season of long winter evenings. In some villages there are clubs, reading rooms, and other means for bringing the youths and young men together for the sake of amusement and mutual improvement, and the success of these efforts is of a varied character. Some village institutions have failed entirely, and one wonders why. Perhaps in cases it is owing to the lethargy of the youths themselves who have no wish to move out of their dull rut and be amused and educated, but often we find there is a kind of goody-goody, namely, a pretty patronage over village institutions, which prevents possessing any spirit naturally resent. If village recreation and reading rooms are to be successful the management should be in the hands of the members themselves, under proper supervision, because we find that country fellows resent patronage, and if they are treated as such and confidence is placed in them they never fail to

accept the responsibility, and they look upon the village institute as something of their own, and they know that its success depends largely on their efforts.

The Culture of Sugar Beet.

THINGS are not so rosy in the agricultural world but what farmers would not take up the culture of a fresh crop if it promised to pay better than some already grown, and the question has cropped up again with renewed vigour as to the possibilities of this country for the cultivation of sugar beet. The topic is no new one, because it has been more or less to the front for some time, and latterly it has been freely discussed both at the Central and other Chambers of Agriculture. There seems to be a general opinion on the part of various experts who ought to know, that sugar beet can be grown here as well as in Germany, but the difficulty of actual cultivation is not the only one, because there is the Sugar Convention to be considered, and if beet growing is to be taken up with any prospect of success, the Government must extend its co-operation and help. According to Lord Denbigh, fifty million tons of roots were grown on the Continent last year, and the benefit to root-growing districts was

enormous. If it is possible for British farmers to have a share of these benefits, it would be a pity to let the opportunity slip.

Another Fruit Pest.

KENTISH farmers who are also fruit growers are much perturbed just now about the American gooseberry mildew which has found its way to this country, and if allowed to get a firm hold it may prove to be even a worse trouble than the "big bud" pest in the black currants, which threatens to ruin this important branch of the fruit-growing industry. We notice that Mr. Lawrence Hardy, M.P., recently moved a resolution at the Central Chamber of Agriculture advocating the Board of Agriculture to prevent the importation of gooseberry bushes from any countries where the disease was known to exist. The motion was accepted, and a recommendation that the Board of Agriculture be asked to send out leaflets was passed. So far so good, but something more than the mere publication of leaflets is wanted, and if this disease is as deadly as it is said to be, surely the most stringent measures should be adopted to keep it outside this country. We have already got pests and diseases enough to deal with.

I were a landlord-peer, I should unhesitatingly advise that the Bill should pass through. It will really now accomplish little more—excepting so far as shooting rights are concerned—than the first Agricultural Holdings Act Amendment Act.

A Friend among the Knights.

I have been remonstrated with by an Evesham correspondent at my failure to notice the agrarian significance of the knighthood conferred upon Sir Arthur Biggs. Well, I must protest that this is not due to personal appreciation. Sir Arthur—who, by the way, fought Evesham at the last election—has made at least one phase of agrarian economics the object of his direct solicitude. In his desire to enlarge the Market Gardeners Act and to make it retrospective—and in this anxiety he has been followed by his erstwhile antagonist, Colonel Long, M.P.—he has inspired a movement which will inevitably be reflected in legislation. Heaven forbid it be deemed that I desire so estimable a representative as Colonel Long to be displaced; but I should like to have seen Sir Arthur occupying a seat in this House. At all events, he would have removed the misapprehensions of the effect of the Market Gardeners Act which have been revealed during the debates on the Land Tenure Bill. I am persuaded that not a few of the Radicals who dilated upon the purpose of that Bill and contrasted it with the object of the Market Gardeners Act had never even perused the latter measure. I congratulate Sir Arthur upon the gratitude which his party has wisely shown. I felicitate his party in that it has had the wisdom to do honour to so cogent, wisely-moved, and courteous an agrarian reformer.

The Younger Tories.

In my last article I made allusion to the intellectual vitality of those whom I may describe as the leaders of the young bloods of Toryism. In this I was particularly alluding to Lord Turnour and Lord Helmsley. I for reasons which will be apparent to most members of the Central Chambers of Agriculture deplore the attitude they have adopted towards the Land Tenure Bill. All the same, I rejoice in their Parliamentary virility; and rejoice all the more that it should have its most virile expression in connection with an agrarian question. It is a happy portent for agriculture that men predestined to be party leaders should deliberately associate themselves with the economic evolution of our industry. I regret much of their action in this particular connection; but, after all, they have both exhibited the saving virtues of knowledge and have both revealed the admirable grace of capacity. They represent a phase of generous landlordism which it is well should have expression in the democratic chamber. Their obliqueness must be attributed to their youth; but ever and anon you obtain glimpses of an excellent sagacity and a wise comprehension. Agrarian politics are the better for having associated with them young men of their knowledgeable ability.

Complimentary Dinner to Major Craigie, C.B.

It is proposed to take the occasion of the recent retirement of Major Craigie, C.B., from the Board of Agriculture and Fisheries to entertain him at a complimentary dinner, in recognition of his long and distinguished services to the interests of agriculture and the furtherance of statistical knowledge.

The dinner will take place on Wednesday, December 12. A committee which has been formed to make the necessary arrangements comprises—The Earl Carrington, K.G., the Earl of Jersey, G.C.B., the Earl of Onslow, G.C.M.G., the Lord Burghclere, the Lord Eversley, the Right Hon. W. H. Long, M.P., the Right Hon. H. Chaplin, the Right Hon. A. E. Fellowes, Sir R. B. Martin, Bart., Sir T. H. Elliott, K.C.B., Sir A. E. Bateman, K.C.M.G., Sir J. A. Baines, C.S.I., Mr. B. St. John Ackers, Mr. A. Wilson Fox, C.B., Mr. F. Hendriks, Mr. R. Inglis Palgrave, F.R.S., and Mr. R. H. Rev.

Gentlemen desirous of attending are requested to intimate their intention as soon as possible to Mr. R. H. Rev. 3, St. James's Square, S.W.

The King of Sweden has appointed Mr. Thomas W. Sanders, F.L.S., a Knight of the first class of the Royal Order of Wasa, in recognition of his services in connection with a visit paid to Sweden by Representatives of the British Agricultural Press during the summer. Mr. Sanders was the chairman of the party.

Agricultural Politics.

BY A LOBBYIST.

The Unwisdom of the Critics.

I happened to catch up certain newspapers which reported the all-night sitting of the House of Commons. Is their antagonism to the Land Tenure Bill—which in part realises the desire of Mr. Walter Long, and in part realises the anxiety of a committee of which Mr. Henry Chaplin was an important member—attributable to an ineradicable objection to land-tenure reform, or to partisan bitterness against their political opponents? Had their antagonism been attributable to enmity to the principle of the Bill, why should they chortle at every concession? "The Government surrenders," quothed one journal. "The Government makes many surrenders," declared another. Here you had, not gratification at a Governmental concession to a wise and sane argument, but dour and sinister party gratification that in spite of Radical protests the Government had yielded to persistent Conservative clamour. Instead of a compliment to the Government which had accepted Conservative argument, which had yielded to cleverly-urged requests, you had vainglorious self-gratulations and mere partisan word-flinging. Of course, the Conservative leaders are not to blame for this; but the Conservative bear leaders would be wise to keep a sterner control of their henchmen. The fact is that, instead of being gratified at concessions to Conservative economy on the part of Ministers who, I can assure you, ruffle the party devotees by these concessions, you simply indulge in a cock-a-doodle-do, you make the path difficult for any further yieldings to moderate desires and designs.

The Humours of the Situation.

One of the humours of the debates on the Land Tenure Bill has been the Radical affection for what they glibly describe as "intensive culture." Over the question as to whether strawberry beds and asparagus should be included in the protective provisions of the Bill, they utilised the word "intensive" with an iteration that was—I have, of course, a poetic license for this description—damnable. It was given an unctuousness that never belonged to that blessed word "Mesopotamia." "Intensive," sighed the Radical, and his fellow sighed back the word with a dolorousness that was almost tender. You would have been pardoned the belief that the safety of the Empire, nay, of the spheres, depended upon it. My old friend, Mr. James Rowlands, the member for Dartford—whose early training was in the watch-making business—played with it with the same delicacy of fervour that he might have in other years manipulated a mainspring. He told us what Denmark had done with intensive culture. He limned for us an appalling picture of an invasion of Danish eggs of such quality and beauty as would put every honest British hen to shame. He portrayed the Danish pig in such fascinating pigments as no Irish sow deserved since the days of Brian

Boru. And he was echoed by others. Take my word for it—"intensive culture" is to be the future Radical *mot d'ordre* in dealing with agrarian questions. Assuredly, too, it has the quality of sonorosity.

When Obstruction does not Pay.

I am convinced that the obstructive game in connection with the Land Tenure Bill was bad tactics. It may be urged in reply that one result of it must be to convince the Lords that there is a great volume of Conservative opinion against the Bill. The Lords knew this from the beginning. What, however, did these tactics really do? They served to show that upon the vital principles of the measure the Government could command a majority of something like two hundred. They served to show that where there was any weakening of the Government intention the Radicals were in revolt. They served to reveal—and mind, we live in a democratic country in which even the Upper Chamber is supposed to have a revising rather than a checkmating character—that the Radical anxiety is to deal not with what is described as "the fringe of the land problem," but the problem itself. It served to strengthen the aim of those visionaries, the land nationalists—to give more power to their elbow and more volume to their voice. Is this a desirable achievement? Is it well to give to the Radical a new justification for demanding the sympathy of the allotment holder and the small holder? In these days, when the counting of noses is an exact political science, the giving of your enemy a cause of appealing for rural support is poor strategy.

What will the Lords do?

Of course, the question now is what will the House of Lords do? I move among the Radicals as well as among the Tories, and in the lobby I have had an opportunity of peering into their inmost thoughts. They there frankly confess that they think infinitely less about the fortunes of this Bill than they do about having a new weapon with which to attack the Lords. These men would prefer that the Bill should be not merely mutilated and lacerated, but given the coup de grace at once and finally. They are intent on the cup-to-overruling argument. They want an excuse for saying that in their own selfish interest the peers deliberately set themselves athwart the will of the country. The Bill in itself, I repeat, not regarded with overwhelming favour by these men. They do not even regard it as an anodyne. They look upon it as a tentative measure, which is actually calculated to postpone the realisation of their own wilder designs. If this Bill be passed, it will be simply impossible to introduce a bolder scheme of land reform for at least a session or two. The success of this Bill would thus mean the postponement of their own purpose. The land nationalists in the Commons, the Byleses and the like, have had, I mean, to be dragged into voting for it. If

SHOW GOSSIP.

Norwich Fat Stock Show.

"Fat Cattle Show Week" is always looked forward to with keen delight in East Anglia, one reason being no doubt that it is the herald of the festive season of Christmas, but greater importance attaches to the Norwich show as being the first of the trio of principal Christmas fat stock shows, and all the breeders and graziers in the United Kingdom always evince the greatest interest in this exhibition, as the show invariably introduces a number of animals to the ring which can be relied upon to fight hard for the honours at Birmingham and Smithfield. On several occasions the champion beast at Norwich has carried off the same honours at the Midland and London exhibitions.

The thirtieth annual exhibition will open at the Agricultural Hall, Norwich, under the presidency of Sir Edmund O. Nugent, Bart., of West Harling Hall, on Thursday next, the 22nd inst., and will continue over Friday and Saturday.

The Minister of Agriculture (the Earl of Carrington) attended by a large party of influential agriculturists, who will be the guests of the Right Hon. Ailwyn E. Fellowes, of Hovingham, will attend the show on the Thursday.

The entries in all departments are well up to and in some cases above the average, as will be seen by the following comparative statement, which gives the number of entries at each show since the commencement of the association, viz.:

Year.	Beasts.	Sheep.	Pigs.	Roots, Grain, &c.	Poultry, Butter, &c.	Seedsmen's Prizes.
1896...	120	93	24	26	92	179
1897...	111	114	24	33	111	216
1898...	119	81	51	33	106	205
1899...	123	93	24	35	151	167
1900...	90	105	48	31	161	208
1901...	113	97	*	42	145	207
1902...	98	63	27	47	157	202
1903...	120	84	36	43	158	221
1904...	107	96	15	58	159	215
1905...	122	96	33	61	164	219
1906...	99	90	36	64	174	214

* No show of pigs in 1901, in consequence of severe fever regulations.

The prize list comprises seventeen classes for cattle, and prizes of £10, £5, and £2 are offered in each; six classes for sheep, and prizes of £8, £4, and £2; four for pigs, with prizes of £5, £3, and £2. There are nearly sixty classes for roots, grain, dairy produce, dead poultry, &c. In addition to the class prizes very valuable champion and special prizes are offered.

A new feature this year will be a weight guessing competition. The Norwich and District Butchers' Association are providing a bullock for the competition which will stand in the hall during the three days of the show, and afterwards killed. The actual dead dressed weight of which, with the names of the winners guessing nearest to the actual weight, will be announced in the following week's newspapers. The committee are offering four prizes of £2, £1, 10s. and 5s., and it is expected this competition will create considerable interest.

The show opens at 10 a.m. on Thursday (at which hour catalogues may be obtained) and the admission each day will be as follows:—Thursday, from 10 a.m. to 2 p.m., 2s. 6d.; from 2 p.m. to 9.30 p.m., 1s. All day Friday from 10 a.m. to 9.30 p.m., and Saturday 10 a.m. to 5.30 p.m., 1s.

Judges.

CATTLE.—Mr. D. F. Smith, Easton Park, Wickham Market; Mr. Robt. Wright, Necton Heath, Lincoln.

SHEEP.—Mr. F. H. Jennings, Cockfield Hall, Bury St. Edmunds; Mr. S. Treadwell, Waddesdon, Aylesbury.

BUTCHERS' BEASTS AND PIGS.—Mr. J. M. Outlaw, Pulham Market; Mr. Frank Rands, Hunstanton.

ROOTS AND GRAIN.—Mr. Wm. Case, Tuttington Hall, Aylsham; Mr. Chas. Waters, Postwick, Norwich.

Judges for the Birmingham Show.

The following are the judges appointed for the Birmingham Cattle Show:—

Herefords, Devons, Welsh, Keries, and Extra Stock.—E. F. Maunder, Cricheil, Wimborne; Christopher Williams, Glenhorne, Holmer, near Hereford.

Shorthorns, Scots, and Crosses.—W. T. Garne, Aldsworth, Northleach, R.S.O., Glos.; R. Walker, Rosefield, Elgin, N.B.

Butchers' Prizes.—Cattle: H. Patterson, Acock's Green; J. H. Raymond, Erdington; F. W. Stoddard, Ladywood Road, Birmingham.

Sheep.—W. Barrs, Tempe, Atherstone; Allan Cooper, Norton, Bishopstone, Lewes; H. Lambert, Babraham, near Cambridge.

Pigs.—T. S. Minton, Montford, Shrewsbury. Butchers' Prizes: Pigs.—A. Marsh, Brierley Hill; C. H. Palethorpe, Dudley Port.

Corn.—E. B. Ludlow, Holto Street, Birmingham; W. T. Kishon, Acton Road, Birmingham.

Roots.—R. G. Patterson, Acton Hall, Stafford; F. H. Yates, Woelford, Lichfield.

Potatoes.—W. Halliday, Patshull Gardens, Wolverhampton; G. Worthington, The Gardens, Guy's Cliffe, Warwick.

NOTES.

Friday, September 20, 1907, is the date chosen by the Hay Horse Show Society for their next show.

The Lamport Agricultural Society has fixed on Thursday, September 24, for the date of their 1907 show.

The thirteenth annual show of the Doncaster Christmas Fat Stock Show Society will be held in Doncaster Cattle Market on Tuesday, December 11, and seeing the good prize list that has been drawn up, there should be a good display of stock. Eleven classes are provided for cattle, eight for sheep, and five for pigs, the prizes ranging in value up to £5, while there are some special prizes. Entries close on December 4 with the secretary, Mr. F. H. Chafer, 9 Market Place, Doncaster, from whom conditions of entry, form, &c., can be had.

The entries for the Scottish National Fat Stock Club's show at Edinburgh on December 5th and 6th number \$30, as compared with 743 last year, an increase chiefly due to more root, grain, &c., entries which number 468 as against 340 in 1905. Of cattle there are 171 entries, a decrease of 27; of sheep 94 pens, no more than last year; and

SHOW SECRETARIES.

MR. C. HOBSON,
Haywards Heath and Groombridge Fat Stock Shows.

pigs and stands are the same, viz. 15 and 37, but the butter-making department has experienced a drop of nearly twenty, the year's figures being 45, and that of 1905, 63.

Prizes to the total value of £114 are offered by the Maidstone and District Open Fat Stock Show Association for their show and sale to be held in Maidstone Cattle Market on Thursday, December 13. There are nine classes for cattle, four of which are for animals of the Sussex breed; seven classes for sheep of various breeds, and six classes for pigs; whilst in addition there are some champion classes. Full details, with conditions of entry, &c., can be had on application to the hon. secretary and treasurer, Mr. J. Kitchen, 10 King Street, Maidstone.

The committee of the Suffolk Agricultural Association met at the Town Hall, Ipswich, on Friday, the principal business being to receive deputations from towns in Suffolk desirous of entertaining the association in 1907, and to consider the town at which the show should be held. Mr. E. G. Freyman, the retiring president, occupied the chair, there being a good attendance. The Mayor of Sudbury said after the interviews he had had with Mr. Robert Pond (the secretary) he felt assured that the ground they had to offer would be accepted. It was the same ground on which the last show was held, and if a larger area was required he did not think there would be any difficulty in hiring an adjacent field. The town would be prepared to loan the old ground and to give them water. The site was about eight minutes' walk from the

station. At the annual general meeting Mr. S. P. Sherwood proposed that the invitation from Sudbury be accepted, and this was seconded by Mr. P. M. Browne, and carried unanimously. Mr. Cuthbert (quilter) was elected president.

A PURITY OF CIDER MOVEMENT

Remarkable progress has been made during the past decade as to meeting the wishes of the general public in the production of cider. In some counties the apple, especially the cider apple, has become the backbone of the tenant farmer, and on some farms the return from the orchards equals that from the cows. But whilst the English cider-grower has been doing his level best to produce an honest beverage and create a market for the same, it has at the same time opened a very wide door indeed to the faker, much to the detriment alike of the public and the genuine maker. Nearly all the shows that now hold cider exhibitions in connection with them distinctly state that the cider must be pure and subject to analysis. The Bath and West Society most rightly set this matter on foot, and it was perhaps most fitting that the pure cider movement should be inaugurated at the Nottingham meeting, where a resolution was proposed and carried that the Board of Agriculture be requested to take steps to ensure the purity of cider. Matters seemingly fell into abeyance, but at the Windour meeting of the Bath and West cider growers assembled in force and passed what was practically a vote of censure on the Bath and West Society for not having taken steps to ensure the purity of cider. The rise in the price of cider and the enhanced demand for the same has brought out an increased supply of fakes, some of which do not contain a drop of apple juice whatever. This has been too much for the cider apple grower.

At the Totnes Chamber of Agriculture Mr. Hoare opened a debate on the adulteration of cider. In doing so he referred to the large quantity of so-called cider put on the market in which there was very little apple juice, and in many instances none at all. He considered that the word "cider" belonged entirely to the juice of the apple, and as such the property of growers of apples and producers of ciders. There should be legislation to prevent any sort of concoction being put on the market and called cider, and therefore he considered that cider should come under the operation of the Food and Drugs Act. Mr. Winsor, in seconding, said that almost every other article was protected, and people should not be allowed to supply what had perhaps never seen an apple as cider. Mr. Jas. Hill thought that sweetening might be allowed when the sugar gravity of the cider was low; but he agreed that cider should not be stretched from a pipe into a truck load. Mr. J. R. T. Kingwell did not think they would prejudice the public by letting it be known that cider was pure, as pure cider agreed with most people. The purer they could keep it the more popular it would become. Mr. Hoare, in reply, stated that personally he had no objection to the use of sugar, but what they wanted was to stop making one cask of cider into four by means of water and chemicals. The resolution was agreed to.

The next public meeting was at the West of England Cider Show, held by the Mid-Somerset Agricultural Society at Shepton Mallet, where a cider conference was held under the presidency of Colonel M. Clerk. There were present Mr. A. E. Brooke Hunt, from the Board of Agriculture, and the leading cider makers in Somerset, and many from the adjacent counties. The president, in opening the proceedings, said that they were always trying to put something new before the public in the way of agricultural work. Cider makers experienced many difficulties owing to some of the impure things that were placed upon the market as cider; but he thought that in this society, in connection with the County Association and other local societies which were interested in the subject, put their shoulders to the wheel they would be able to take some steps to secure such legislation as would bar adulterated stuff coming from abroad and being sold as good Somerset, Devon, Hereford, or Worcester cider. The secretary of the society, Mr. W. Oswald, then introduced the subject of "Cider," and proposed to secure the purity of cider. He dealt with the extent to which medical men were recommending cider for medicinal purposes, and their endeavours to secure a good article. That was a difficult one, by reason of the fact that the sophisticated stuff put upon the market was so cheap. It was, he felt, imperative that some steps should be taken to secure the

purity of cider, and that the credit of the productions of their cider districts should not be destroyed by the concoctions sold as cider. They must keep on trying to get action taken by the Board of Agriculture and the Government.

Mr. Eldred G. F. Walker rose to move a resolution upon the subject as follows:—"That this meeting of cider growers regrets the apparent apathy of the Board of Agriculture as regards securing the purity of cider, and desires that the Board of Agriculture and the Local Government should be asked to receive a deputation, to urge them to appoint a joint Departmental Committee to define what shall be called cider, the pure juice of the apple, and take steps to prevent other things being sold as cider that do not come within their definition." The mover of the resolution stated that the system of faking had greatly injured the cider industry, and was likely to do more harm in the future than it had done in the past if this faked stuff continued to be put on the market as cider. Amongst the other evils they had to contend with was the addition of salicylic acid to apple juice. This was put in to an incredible extent in some ciders. He thought they had a fair charge against the Board of Agriculture and the Local Government Board that they had taken no steps whatever to stop this injurious faking of an important article of consumption. When these boards were brought to the point upon the matter, instead of tackling it they ran round the corner. They were down on the milk vendor who sold milk under a standard (which at times it was quite impossible to produce) of the quality demanded, and they were down on the farmer otherwise, but they left the cider faker to do as he pleased. He considered that every possible pressure must be brought to bear upon the Boards to secure purity of cider, by fixing a standard and proceeding against any person who sold stuff which was not pure apple juice. He suggested that a deputation should wait upon the Board of Agriculture to urge their views. Mr. Slatter, Worcester, seconded the resolution. He thoroughly agreed with the suggestions that had been thrown out; the makers of this district would be quite prepared to support the resolution. Mr. Tilley, who rose to support, said that he had very great sympathy with the proposition before them. It was a question that really affected half the farmers in Somerset, for if they were not cider makers themselves they were apple growers, and wanted to sell their fruit to the cider makers. They had to pay heavy duties if they sent their produce abroad, and were subject to many restrictions; but the foreigner could send his faked concoctions into this country without the least trouble, and could thus bring discredit upon the cider industry without anyone interfering.

Mr. A. E. Brooke Hunt, on behalf of the Board of Agriculture, replied that he had been very much interested in the discussion. He thought they were going on in a thoroughly right direction in endeavouring to secure the purity of cider, but he reminded those present that the proper course to adopt was through the law courts. They had recently had before the court a case to define what was whisky, and a similar course must be adopted in the case of cider before anything could be done by the Board he represented. They must have a decision of the law courts as to what constituted cider before they could take any action. It was for the cider makers and the societies interested to take steps to obtain that decision, and if then it was found necessary to take any further action, the case could be promptly brought before the Boards interested. He admitted that there were many things which required to be remedied, but at the present time there was no definition of what was pure cider. (A voice: "Apple juice.") They might say it was pure apple juice, but he contended that their opinion and statement would not define the law on the subject, which only could be done in a test case. He defended the Board of Agriculture from the charge of apathy, and said that in response to a request to various authorities to take steps to have samples of cider taken, they had one case which showed the "cider" to contain about eight times as much of a certain preservative as was recommended by the Committee on the subject of preservatives. Some of these samples could not be described as being cider at all. He again urged that the proper step to take was to secure a test case and then come to the Board.

Mr. Walker was called upon to reply to the various points raised in the discussion. He compared the reply of Mr. Brooke Hunt on behalf of the Board to that of a thorough diplomatist. By this he was reminded of the old farmer's definition given to his son that a diplomatist was like a man trying to walk all round a gate-post. The boy replied: "But how does he manage when the gate is shut?" And this was the farmers' predicament. How could the Board expect a body of poor men to fight a case to ease it from its present responsibilities? In this respect they are further hampered by the absolute ignorance of the general public as to the various concoctions and fakes that are foisted upon them as cider.

By Lupulin.

The Borough.

I very much regret that I am unable to report any sign of improvement in the situation of our market. The weakness noted in my last report has become more definite, and although some business has been done, sacrifices have been submitted to big holders, amongst whom there is evident a greater desire to realise.

Merchants declare that their customers have apparently ceased from buying, except to a very limited extent, and the general result is seen in the prevailing dullness of the market, which condition, like the overhanging clouds, just now pouring down torrents of rain, appears to have become almost permanent. An old writer says:—"As things seem large which we through mist desecy, dullness is ever apt to magnify. How shall we apply these words to ourselves? Dullness naturally creates depression, and a depressed mind is certainly inclined to magnify its present troubles.

Most of the traders with whom I have recently spoken seem to be rather inclined to take this view of our prospects. They point to the slackness of demand and the readiness of holders to accept lower bids; they also speak somewhat despondently of the probabilities of large arrivals from America and the Continent, and deplore the gloom which surrounds the outlook. But some of them are more sanguine, and their magnification of the view that appears through the mist takes the direction of possible dispersion of the clouds, the reappearance of the sunshine of active business, and the consequent revival of better values. They discredit the reports of the great American surplus, anticipating that the increased consumption of beer in the United States will require a larger quantity of hops than has been calculated for. For my own part, while my hopes and desires are for the brighter aspect of the future, my fears are on the other side.

To be honest, I am compelled to admit, however unwillingly, that if any reliance is to be attached to the information before me, the outlook is far from satisfactory or encouraging, and I would respectfully repeat my suggestion that English growers will be well advised if they closely scan the course of events from day to day, and are on the alert to seize any opportunity for business that is fairly favourable. The best prices they can now obtain cannot be remunerative, but is it not better for them to "cut their losses" now than to risk further depreciation by postponement of the evil day.

It is, I know, but poor consolation to growers to know that they are not alone in their disappointments. The season has thus far been unprofitable to all concerned. Factors' commissions are diminished by the small crop and the low prices, while office and warehouse expenses have seriously increased. Merchants, subject to keen and somewhat unscrupulous foreign competition, are hampered by the small volume of business, their outlay incurred by seeking for orders being exceptionally heavy, and their other current charges fully up to the average. Therefore I cannot understand why they should be accused of "bearing" the market, when it is manifestly to their interest to support and strengthen it. The present state of things has been brought about by causes over which neither growers, factors, merchants, nor brewers can have had any control.

The most important, as far as the English industry is concerned, are excessive production of hops all over the world, diminished consumption in England, and the facilities afforded to brewers by cold storage. These are facts that cannot be disputed, and when to these is added the freedom enjoyed by foreign producers in our markets. We are provided with sufficient explanation of the annoyances from which our planters have suffered this season. Whether they can be modified in our future experience is a problem that remains to be solved. In the meantime we cannot immediately get rid of them, and can only suffer and be strong in resolution to make the best of such very trying circumstances.

Foreign Hop News.

America.

The following extract from a letter received this week from friends in Washington gives the position on the other side at the beginning of this month:—"We note what you say regarding your market, and are sorry that we can give you no encouraging news from this side. The crop in the United States came down heavier than was expected.

The quality in Oregon and Washington is very poor. There has been a little buying for export, but it seems to have slackened off. American brewers are absolutely indifferent, it is impossible to interest them at any price. Many dealers are offering hops for December and January delivery at 13 to 14 cents. These would have to be purchased at 10 cents or under to show a profit. On account of the brewers not buying, dealers will not operate, and the grower finds it impossible to get an offer.

Growers seem to feel that this will be a low-price year, and we are afraid that they will become panic stricken soon. If they do, there is no telling how low hops will go. We have 150,000 bales more on this side than we need, and we look for heavy consignments to go forward to England on low advances, and while this will not relieve the situation here, it will have an effect on your market."

Nuremberg.

The recent course of business does not show much change. A healthy demand continues both for home consumption and exportation. From November 1 to 8 the arrivals amounted to 4,550 bales, and the sales reached 5,400 bales, stocks being thus reduced by 850 bales. This result is considered very satisfactory.

Values have remained very steady, merchants being very firm in their quotations, while buyers do not show any inclination to pay higher prices than the present currency. Best green tops are quoted and selling at 105s. to 115s., medium qualities at 85s. to 95s., and the lower grades at 60s. to 75s. It must be remembered that these figures are for partially dried hops, which cost from 20s. to 25s. more to finish and hale. Latest advices report the market generally firm, especially for hops of good colour.

Belgium.

The market is very quiet, with a slight tendency towards reduction of values. There is but a small demand, either for local consumption or for exportation. Latest quotations are 67½ francs for Poperinghes, and 72½ francs for Alosts.

Saaz (Bohemia).

A steady business at the rate of about 100 bales daily has continued during the last three weeks. The principal buyers are local, as comparatively few hops are being sold to Germany.

The improved position of the Nuremberg market has assisted in hardening the value of our growths, and recent quotations are 165s. to 175s. for best; 150s. to 160s. for mediums; and 135s. to 145s. for the lower sorts. The amount of business already done has, it is estimated, disposed of fully three-fourths of the crop.

Russia.

Buyers have been active, and values of Polish hops of best quality have reached a price equal to 155s. per cwt. Medium hops are selling at 135s., but the lower grades, such as are sold for exportation, can be obtained as low as 9 to 10 roubles per lb., equal to 85s. to 90s. per cwt.

The forthcoming exhibition of the West of England Fat Stock and Poultry Society, according to present indications, promises to be one of the most successful yet held. Last year's show was voted to be a good one, but the display which takes place in the Plymouth Market on December 12 and 13 will comprise nine additional classes, and a large increase in exhibits. The total prizes amount to £450, and the entries close on November 24. The cattle will probably make a fine display, and some additional encouragement to exhibitors of sheep is given in the provision of another Exmoor class, and the addition of third prizes in all the classes. An extra cup of the value of 55 s., is also given by Messrs. Mortimer Brothers, Plymouth, for the best pen of sheep.

The first of the Thirsk Martinmas hirings took place on Monday in fine weather, and was largely attended by both male and female servants. As a rule farmers in this portion of North Yorkshire are not quite so early with their ploughing and sowing as last year, and consequently situations were harder to obtain at slightly advanced rates. Female servants for farmhouse were rather scarce, girls seeming to prefer town places to the country. Hinds with wife to attend poultry, with cottage, milk, and potatoes found, 18s. to 19s. per week; capable farm foremen, £26 to £30; head lads and horsemen, £17 10s. to £18 10s.; farm boys, £7 to £12; farmhouse head girls, £20 to £21; second hands, £15 to £16; cooks for town places, £20 to £22; general servants, £13 10s. to £15; housemaids and chambermaids, £11 10s. to £13; nurses, £10 to £12; under nurses, first time out, £9 10s. to £7 10s. for twelve months.

CORRESPONDENCE.

Midland Notes.

A Subscriber's Opinion of the "Mark Lane Express."

SIR,—Your¹ this morning, *re* MARK LANE EXPRESS, to members of Lancashire Farmers' Union at a low rate. I have pleasure in ordering same, and enclose postal order in payment of subscription for same, to be sent me for twelve months. Please acknowledge. I am sure to get your paper every week will be one of the advantages farmers reap by joining the Union.

I may say I took your paper for years, and know it to be one of the best—if not the best—of its kind. I only left off taking same some time back, as I gave up a large bit of rented land, and now only farm my own smaller farm, and times being bad with farming, we then cut off all expenses we could. As I have said, knowing it in the past as I did, I am sure members will do well to accept your offer.—Yours truly, R. M. COLE.

Old Hall, Roxholme, Sleaford,
November 13, 1906.

Prevention of Butter Fraud in the Netherlands.

SIR,—A Government Bill has just been introduced in the Parliament of the Netherlands, which contains provisions for the better prevention of frauds in the butter trade.

As the trade in this article between Great Britain and the Netherlands becomes more extensive every year the Bill has some importance for your readers, and I should therefore feel obliged if you could find room in your columns for the enclosed synopsis.

H. S. J. MAAS.

Consul-General for the Netherlands,
Netherlands Consulate General for
Great Britain and Ireland,
12, Blomfield Street, London, E.C.,
November 7, 1906.

Commercial butter must contain a certain percentage of fat, to be fixed by Royal decree. Margarine shall not indicate a higher saturation figure than 10 for the volatile fatty acids contained in it.

The manufacturers of margarine, and of margarine and butter together, are registered.

Manufacturers of margarine shall not deliver or forward butter or store butter, for the purpose of being forwarded.

In the places where butter is made and in spaces communicating therewith, no margarine may be present, nor any other fat which could be mixed with butter.

Those who manufacture margarine as well as butter are made subject to special and continual Government supervision as regards the places where butter is made and stored. They have themselves to pay the expense of this supervision. The places where butter is made and stored shall be separated from those where margarine is made and stored.

Traders and shopkeepers who make mixtures of butter with any other fat are considered to be manufacturers of margarine.

The officers whose special duty is to see that this law is duly observed are authorised at all times to enter the places where butter, margarine, and other foreign fats are manufactured, and also the places used for storage by the manufacturers concerned. They can also take samples in all such places.

The same authority is given as regards shops, auction rooms, places used for storage and other spaces where butter, margarine, or other fats are present or are supposed to be present, and also as regards the means of conveyance.

A similar authority is given as regards places where the said fats are manufactured to chemists entrusted with the making of analyses for judicial purposes.

The Bill contains a stipulation giving power to prepare regulations as regards the importation of foreign butters.

Wilful contraventions of the principal provisions of this law are punishable with imprisonment only.

Messrs. Sutton and Sons' Potato Trials.

SIR,—The trials of potatoes undertaken by Messrs. Sutton and Sons at Reading have attracted widespread attention in agricultural circles.

The comparative trial of South of England, Lincolnshire, Scotch and Irish grown seeds resulting in so decisive a verdict in favour of the Irish seed, seems to be regarded as the most important and far-reaching of the series.

It was suggested as a reason for this supremacy that possibly the Irish seed was one year's seed from Scotland. This cannot in any way be, however, neatly countered by the comment of Mr. Arthur Sutton that evidently it had been improved on the journey.

Having had the honour of contributing the Irish seed of five out of the eight varieties tested, four of which came out on top, and having been unable to accept Messrs. Sutton and Sons' kind invitation to be present at their demonstration, when the facts could have been stated, I beg to ask your kind permission to make the necessary explanation now. The seed of Up-to-Date supplied had been grown here for the three previous years, that of Duchess of Cornwall, King Edward VII., and British Queen for two years, and Sutton's Ninetyfold (seed direct from Sutton's) for one year.

The following table of results may prove of interest:—

Variety.	Irish.	Scotch.	Lincolnshire.	South of England.
Up-to-Date	132	76	100	33
Duchess of Cornwall	112	101	85	27
Sutton's Ninetyfold	98	65	53	10
King Edward VII.	81	59	59	22
British Queen.....	105	130	111	58

Totals..... 528 431 408 150

The supremacy of the Irish-grown seed in this unquestionable test, supplemented as it has been by similarly marked success in other public English trials, notably those of the Harper-Adams Agricultural College in 1906, and of the Surrey County Education Committee in 1905 and 1906 (for both of which I also supplied the Irish seed)—is a factor of much importance to Ireland.

Irish farmers should in the words of the *Farmers' Gazette* now turn their energies to the great market for the disposal of large quantities of sound, reliable potato seed which lies open before them, and it is entirely dependent on their own tact and enterprise whether they shall go in and take possession of the advantages offered.

As was wittily said at the Sutton demonstration, "the Irish growers have the ball at their feet if they had only elbow grease enough to kick it."

Unfortunately for the average Irish farmer there appears to be only potato—the worn-out champion. This, in spite of constant and widespread failure, he still clings to tenaciously, and he will doubtless continue to grow it long after it has caused his death from starvation.

Your obedient servant,

J. F. WILLIAMSON.

Summer Hill, Mallow, co. Cork,
November 9, 1906.

Home or Foreign Meat for the Army.

SIR,—I cannot quite cut out how Mr. Alfred Welch gets at his figures to prove that if the Government only had home-grown meat for the soldiers that the best part of a million and a half more money would be spent in this country than if foreign meat was allowed to be partly or entirely used. How would it make this million and a-half more meat be made at home? So far as my ideas go there would not be a ha'porth more meat made at home. Just as much money would be sent to the wretched foreigner, as we must have his stuff, because we do not grow enough for ourselves, and you cannot shut it out if you would, for the people would not let you, much as you might like to put the money into the landlords' and tenants' pockets after you have taken it out of the poor consumers' purse. It seems to me not to talk about this wise change stopping a million and a-half of money being made by our farmers and circulated. It would not do anything of the sort. Five years since, when the new rule was made, beef did not go up, and lately it did not go down.

November 16, 1906.

BUTCHER.

At the ploughing match of the North Kent Agricultural Association, held near Dartford on November 1, eight of the ten first prizes were won with the Howard ploughs.

The Board of Agriculture and Fisheries are informed that a horticultural exhibition will be held at Mannheim, in the Grand Duchy of Baden, from May to October, 1907. A copy of the provisional programme can be seen at the offices of the Board, 4, Whitehall Place, S.W.

The principal hiring fair for West Cumberland is that at Cockermouth, and this took place on Monday, when there was an average attendance of both masters and servants. The latter asked wages that farmers were indisposed to pay, and the hiring was in consequence slow. Experienced men obtained from £14 to £18—in one case £20 was offered and refused by a head man—second class men from £11 to £14; lads from £8 to £10; and boys from £3 to £7, with board and lodgings in each case. Girls were in great demand; and experienced servants readily obtained from £10 to £11; younger girls from £6 to £9; and first place girls from £3 to £5.

It can have been no surprise to anybody to hear of floods in the low-lying districts. As one has travelled through the country it has been common lately to see water lying between the ridges and furrows wherever the land is inclined to be at all heavy, so it was only in accordance with expectation to find meadows round Nuneaton flooded by the River Anker, or to hear of fields under water and impassable roads in the Leicester district. By all accounts, Northamptonshire and Staffordshire have fared especially badly, and a Stafford friend tells me of inundations in the Leicestershire district and elsewhere. However, the floods are subsiding now, so we are hopeful we have seen the last of such things for a while.

THERE is one member of the R.A.S.E. council who will be genuinely glad, I am sure, at the offer of prizes for well-cultivated farms in Lincolnshire, and that is Mr. Glover, the Warwickshire representative, who has tried so hard to get the society to offer such prizes once again on its own account.

ONE can well understand the present reluctance to incur any extra expense, even one which would make so many friends among enlightened and progressive tenant farmers. But if the society itself cannot find the money could not our Midland hunts follow the example now set them by the Belvoir, Brockley, Barton, Blankney, and Southwold? There is no scarcity of funds among the wealthy and fashionable followers of the Leicestershire, Warwickshire, and Worcestershire packs, and the compliment and encouragement would be appreciated by Midland farmers, who are often keen sportsmen even when they cannot afford to follow the chase themselves, and are very good in the way of fox preservation and taking down of wire.

IS it not worth while, by the way, for friends of the Royal Agricultural Society in Warwickshire to make a special effort just now to attract new local subscribers? At present the county has but one representative on the council, but with only forty more members it would be entitled to two, and two council or committeemen who can agree well and work in harmony with one another can exert a great deal of influence.

THE sheep dipping order, like the swine fever regulations, finds its enemies and makes some grumblers; but unlike the swine fever restrictions it does seem to be working well and fulfilling its purpose. Worcestershire has never been much of a county for sheep scab—the outbreaks during the three past years were three, nine, and two respectively. But even here there is no disposition to put obstacles in the way of enforcing what is recognised as a desirable and useful order, so that the chief constable at Worcester is able to report the dippings of nearly 140,000 sheep this year. As the total head of sheep in the county, including those in county boroughs, numbered under 150,000 when the last returns were made up, it will be seen that Worcestershire farmers are readily complying with the demands made upon them. They have their reward, such as it is, in the fact that only one solitary outbreak of scab has taken place in the county this year.

THE Earl of Denbigh's speech on sugar-beet growing is only one manifestation among many of the interest which is being taken in this question in various parts of the Midlands. Among others who have tried the crop is the Rev. E. Muckleston, of Hasleley Rectory, whose roots were grown this season in 192 days, following potatoes, on a light, sandy Warwickshire soil, and comparing in quality very favourably with German beet. There are farmers in Leicestershire also who would like to get some of their pastures back to arable, and seem to think that sugar beet might give them the opportunity if only capital could be attracted to the industry by a certainty that the foreign bounties would not be reimposed. It is to be hoped that when the Central Chamber comes to consider the subject again it will see the need of speaking out loud and clear.

THE Worcestershire County Council is showing an active interest in the fruit growing industry by appointing an expert from the South-Eastern Agricultural College to conduct spraying experiments in the county. The question of producing a really efficient spraying fluid, it may be added, has also been engaging the attention of the authorities at Birmingham University for some time past, and it is worth noting that they have found soda and potash much better than caustic soda and soft soap, but inferior to a strong solution of caustic soda and paraffin emulsion. It is expected that this preparation will kill the red spider as well as the eggs of all aphids.

November 13, 1906.

Northern Notes.

A PREJUDICE has sprung up in the North—perhaps its growth has been somewhat slow—against the use of double-furrow ploughs. Now it stands to reason that this implement is not only a labour-saver, but also an economiser of horse flesh. A double-furrow plough performs the work of two single ploughs, and can be drawn by three horses against the pair of horses attached to a single one. One ploughboy can also do the work which would in the case of single ploughs require two to perform. How the prejudice has grown up one does not know. The "handling" of a double-furrow plough may test the stamina of the follower more severely, but that is not altogether the reason for the abandonment of a very useful implement and labour-saver, many of which were to be seen lying idle in the sheds this autumn.

THE most difficult thing to sell just now is arable land. Pasture land in the vicinity of a town realises a good price, and can be let at anything up to £5 an acre. An old hall at Wold Newton (which is eight miles from a railway), with a considerable number of acres, was recently offered for sale by auction and withdrawn because the reserve was not reached. It has since been disposed of privately. The hall was for years the abode of an eccentric gentleman named Cadman, who wore long curls, and who figures in the picture representing the Spa, when our King (then the Prince of Wales) was a visitor. The same gentleman who has purchased Wold Newton Hall has, it is said, also bought Wold Cottage, which has stood empty for fifteen years.

THIS house was once the abode of Major Topham, a London editor and man of the world, who settled down for the last thirty years of his life in Yorkshire. His case shows that clever men will do well anywhere, for having been George III. tip-top adjutant (a play upon his name) and the successful editor of the *World*, he became known as the owner of the best dog in the north of England, and his daughters were said to be the first horse-women in Yorkshire. One would fain hope that the purchase of this estate betokens a return of that love of country life of which Major Topham was such an advocate.

COUNTRY estates being at a discount, it will readily be understood that the landlords in possession of "broad" acres are in no wise eager to spend money on cottage property. There is, besides, a slackness on the part of local authorities to deal with the housing problem. The great obstacle to reform is the apathy of local authorities. When a man's land is paying a big interest or a small one, there is a moral obligation on his part to provide decent cottages for those who labour on the estate, and without whose aid the land could not be worked to profit. Some cases of overcrowding come to light occasionally in our villages which are simply appalling.

ONE within our cognisance engaged the attention of a Yorkshire bench of magistrates. The case occurred in a village which is regarded as poor, and is always overstocked with labourers. The family consisted of parents and six children, their sleeping apartment consisted of a hole in the roof (over a room about 11 ft. square), reached by a step ladder, and containing just over 500 cubic feet of air space. The owner had tried but failed to eject the family, as they paid no rent, and the premises, he stated had been pulled to pieces. One could hardly conceive of such a dwelling in a village set in the midst of a pure atmosphere. Many cases of overcrowding, it was stated, are to be found in the same rural district. Can one be surprised that where it is impossible to respect the decencies of life immorality is rampant?

DURHAM County Council has boldly tackled the overcrowding question in reference to the unsatisfactory conditions prevailing at Usworth. The local district council had refused to put in force the Housing of the Working Classes Act, and the Health Committee of the larger body has got a resolution through the council, and it is proposed to build fifty houses, at a cost of about £200 each. The utter dreariness of some Durham colliery villages is appalling, with their monotonous rows of cottages built under the shadows of the pit-heads and the heaps of waste. The life and surroundings of the agricultural labourer are as heaven in comparison with those of the coal-winner.

THE hirings—some yearly, others half-yearly—are now, as we say, in "full swing." The farmers would be well pleased to effect a saving on their wage bill, which they affirm is too high, as prices of farm produce are at present relatively low. A good hand is, however, worth full market value, and this policy is a mistaken one that puts up with an inferior servant because he is obtainable for a bit less money. Young boys with a

year of service added to their boyhood are apparently scarce, and youngsters fresh from school are less plentiful than usual. The cry of the employer is that the age for leaving school is two years above what it ought to be.

A GREAT fight over the abattoir question has ended at Hull in favour of the proposal of a committee to erect a public slaughter-house. The "trade" has fought against it strenuously in spite of public opinion declaring favourably towards the scheme, which, it is estimated, can be carried out at a cost of under £50,000. The butchers are not to be compelled to use the abattoir, and have done all in their power to defeat the scheme. More's the pity, in face of the authenticated statements of councillors about the nuisances private slaughter-houses are in Hull. Photographs were produced in the council chamber showing their filthy condition. The great majority of slaughter-houses were not constructed for the purpose, and the way in which they are distributed all over the city makes adequate inspection of the meat supply impossible. November 16, 1906.

OBITUARY.

Mr. A. Dudley Clarke.

The death is announced of Mr. Alfred Dudley Clarke, fifty-seven, agent of the Abberley Estates, and a well-known agriculturist and authority on farm buildings. He was a former president of the Worcestershire Agricultural Society, and carried out new arrangements with tenants and various improvements for the late Duke of Marlborough on the Blenheim estate. He won the Royal Agricultural Society's medal for designs of farm buildings.

PARKER'S PATENT LEVER SHAFTS.

Agricultural Imports.

The following account shows the quantities of certain kinds of agricultural produce imported into the United Kingdom in the week which ended November 10, 1906. The quantities in the corresponding week of last year are given in parentheses:—

ANIMALS (living).—Oxen, bulls, cows, and calves (11,637), 9,735; sheep and lambs (757), 1,063; horses (381), 418.

FRESH MEAT (cwt.).—Beef (105,890), 70,145; mutton (49,927), 36,295; pork (11,460), 11,365.

SALTED OR PRESERVED MEAT (cwt.).—Bacon (97,388), 103,814; beef (3,836), 2,401; hams (26,630), 17,077; pork (2,623), 3,766; meat, salted or fresh (12,282), 8,690; meat, preserved (12,235), 2,443.

DAIRY PRODUCE (cwt.).—Butter (72,528), 67,084; margarine (49,230), 18,825; cheese, (64,599), 39,589; milk, fresh (—), —; milk, cream (93,747), 74; milk, condensed (22,691), 14,674; milk preserved (138), 187.

EGGS (Great hundreds).—(488,004), 453,591; poultry (value £) (6,108), 7,244; game (value £) (1,922), 2,479; rabbits, dead (not timed) (cwt.) (3,153), 40,233; lard (cwt.) (46,369), 31,073.

CORN, GRAIN, MEAL AND FLOUR (cwt.).—Wheat (1,558,700), 1,239,000; wheat meal and flour (259,000), 394,100; barley (459,400), 660,300; oats, (129,700), 285,700; peas (53,750), 116,380; beans (38,940), 4,330; maize or Indian corn (547,400), 941,500.

FRUITS, RAW (cwt.).—Apples (134,641), 195,347; grapes (9,700), 6,375; pears (11,695), 8,845.

HAY (tons).—(2,900), 2,671; straw (tons) (476), 708; moss litter (tons) (1,842), 1,675; hops (cwt.) (4,144), 12,665; locust beans (cwt.) (700), 31,100.

VEGETABLES (RAW).—Onions (bushel) (271,864), 181,530; potatoes (cwt.) (29,813), 19,388; tomatoes (cwt.) (6,662), 7,586.

PUBLICATIONS RECEIVED.

Mr. Perry, of the Hardy Plant Farm, Enfield, has now issued an abridged catalogue of trees and shrubs and a new catalogue of border and rock plants, which can be commended to all gardeners.

At Rugby horse fair, last week, there was a capital trade in heavy horses, the pick of which came from £55 to £65. Young animals found a ready sale, yearlings making up to about £25 and two-year-olds £33. Welsh ponies made up to £20.

POULTRY.

Patent Lever Shafts for Poultry Houses, &c.

Poultry breeders who have movable coops will appreciate the invention of Mr. J. Parker, Moss House, Baguley, near Altrincham—namely, patent lever shafts which, when affixed to coops, poultry-houses, rabbit hutches, &c., allow of these being shifted from place to place with the greatest ease. Our illustration shows better than can be described the nature of the invention, but we may add that these patent shafts have each an independent wheel, and are fixed by a pivot passing through the shaft and side of the coop at a point determined by the length of the coop, to give the necessary angle to the wheels when the shafts are raised or lowered.

By lifting the handles the coop is raised, practically horizontally, for wheeling, and on handles being lowered the wheels rise automatically off the ground, leaving the coop flat on the grass. Fowl houses with raised floors by means of these shafts can be deposited flat on the ground, and thus afford a shelter from every wind that blows. The wheels rising off the ground, never get stuck in mud or rot. Being independent these patent lever shafts can be affixed to any ordinary length or width of hutch or coop, and in the case of very wide structures are fitted with crossbar so as to be easily manageable, without arm-stretching, to embrace the handles. The hutches or coops can be wheeled through any ordinary doorway, and can, therefore, be readily transported from the ground to any shed when desired in wintry weather.

By this arrangement it will be readily seen that the old system of trailing coops about, or having two persons to lift the same whenever a change of ground was requisite, is entirely superseded, and the man who wishes to attend to his own stock can now do so with the greatest despatch, without any assistance whatever, and without fear of injury either to the coop or its inmates.

In conclusion we may add that the inventor, being a practical rabbit and poultry farmer, has proved their utility in his own experience. He manufactures coops, houses, shelters, &c., and with each has practically given his patent free, as a comparison of his prices with others will show.

The Colony System.

In order to test the colony system for keeping laying and breeding fowls and of raising chickens, as described in Mr. Edward Brown's "Report on the Poultry Industry in America," recently published by the National Poultry Organisation Society, arrangements have been made for an extended experiment on the college farms at Reading. By these it is hoped to learn how far the system is practicable in this country. Combined therewith experiments in feeding will be carried out, and students taking the various courses will share in the work. Quarterly reports as to results of these experiments will be issued.

DAIRY.

Lancaster Cheese Fair.

At Lancaster cheese fair on Tuesday, sixty-six dairies and 1,218 cheeses were offered, compared with fifty-seven and 1,006 respectively at the last fair. Prices were higher and the market brisk, the quality generally being very good. The highest price realised was 7s. per cwt., other prices ranging from 6s. to 7s., and the lowest was 6s.

Whitchurch Dairy Show.

The eighteenth annual show of the Whitchurch Dairy Farmers' Association was held in the Market Hall on Tuesday and Wednesday. The bulk of the cheese on this occasion was not quite so large as at some former shows, but the entries, numbering over 450 for cheese alone, easily established a new record, the previous best total being that of 1902, which was considered a phenomenal year. The prize money, too, was greater this year than ever before, the amount exceeding £300. As regards the quality, several judges stated that they had not adjudicated on finer or more uniform cheese for a length of time. Mr. Robert Bourne, of Bickerton, Malpas, secured the coveted championship gold medal, presented by the British Dairy Farmers' Association for the best lot of cheese in the show, and he also secured the silver cup of the local association for the best lot of cheese in the local classes.

WE MAKE GUNS

We sell to the user with only one small profit.

We sell for cash direct to the user.

We buy the finest materials to be obtained.

We pay cash for all materials.

We employ some of the finest workmen in the Gun Trade.

We use finest machinery for machine operations.

RESULT.

We sell for £25 Guns of a quality for which sportsmen have previously paid from £50 to £80.

We sell thoroughly reliable Guns.

We get the finest shooting it is possible for guns to make.

Our "Field" Hammerless Ejector Gun.—A perfect Ejector Gun of the finest quality, £25. If made with the best single trigger mechanism ever invented, £30. A perfect pair of these Guns, beautifully matched, £50. A perfect pair of Single Trigger Guns, £60.

"The Gun of the Future," as an Ejector, £15. "The Gun of the Future," without Ejector, £10. A sound and reliable gun, well made, and perfectly balanced, which will give entire satisfaction.

Pattern 8662, £6.—A sound and reliable hard shooting and hard wearing hammerless gun. Better than many sold at double the price.

Pattern 8368, £4.—A sound and reliable hard shooting and hard wearing hammer gun. Better than many sold at double the price.

ESTABLISHED 20 YEARS.

The Tenant Right Valuers' Association and the Land Tenures Bill.

On Thursday Lord Carrington received a deputation on the subject of the Land Tenure Bill at the Board of Agriculture offices from the Tenant Right Valuers' Association, representing several associations.

The deputation was introduced by Sir J. F. Rolleston, who said that it was not well to introduce legislation which might embitter and strain the relations between landlord and tenant.

Lord Carrington, in reply to the deputation, stated that he did not think there was very much between him and the deputation. There was no ground cause for apprehension in regard to the proposed single arbitrator, because he would not be called upon until the landlords and tenants were unable to come to an agreement. He denied that his intention was to spoil the sport, but what he wanted to do in the wing game clause was to prevent game being dumped down without proper compensation on estates in Chancery or insolvency. In regard to the point raised for recovery from an adjoining owner, the object of the Bill was to enable the tenant to recover from his landlord, who in turn could recover from an adjoining owner. Clause 5 was the crux of the question, and he could not understand the outcry of robbery, dual ownership, and Socialism. A tenant would have the right to recover expenses in the case of harsh removal, but there were "no sentimental damages" allowed. He could not understand the hullabaloo about the compensation clause.

Webb and Sons' Root Competition.

The awards in the annual competition for the valuable prizes offered by Webb and Sons, the King's seedsmen, Wordsley, Stourbridge, for root crops grown from their seeds and with the aid of their special manure, have just been made by the judges, viz.—Mr. J. Brown, Easthamstead Park Farm, Wokingham, Berks; Mr. E. T. Learner, Bursli, Aylsham, Norfolk; Mr. J. B. Ball, Knightley House, Eccleshall, Staffs; and the following is a copy of their awards:—

District 1.—Five acres of Webb's swedes, open to the counties of Salop, Stafford, Montgomery, Warwick, and Leicester. First prize, £15 15s., Mr. Richard Timmis, Podmore, Eccleshall, Staffs, 43 tons 2 cwt. 3 qr. 12 lb. per acre; second prize, £10 10s., Mr. Septimus Timmis, Charnes Old Hall, Eccleshall, Staffs, 40 tons per acre; third prize, £5 5s., Exors. of the late Mr. Alfred Hocknell, Norton House, Stone, Staffs, 36 tons 1 cwt. 1 qr. 20 lb. per acre. Three acres of Webb's mangold. First prize, £10 10s., Mr. George Bagnall, Acton Mill Farm, Stafford, 60 tons 5 cwt. 2 qr. 24 lb. per acre.

District 2.—Five acres of Webb's Swede, open to the counties of Hereford, Monmouth, Brecon, Glamorgan, Carmarthen, and Pembroke. First prize, £15 15s., Mr. J. W. Griffiths, Penally, Pembroke, 36 tons 2 cwt. 3 qr. 12 lb. per acre; second prize, £5 5s., Mr. J. R. Thomas, Warren's Farm, Pembroke, 35 tons 11 cwt. 1 qr. 20 lb. per acre. Two acres of Webb's Mangold. Prize, £10 10s., Mr. R. Templeton, Blackweir Farm, Cardiff, 33 tons 1 cwt. 1 qr. 20 lb. per acre.

District 3.—Five acres of Webb's swede, open to the counties of Oxon, Berks, Bucks, Wilts, Hants, Surrey, Worcester, and Gloucester. First prize, £15 15s., Mr. D. Sabin, Sibford, Banbury, 28 tons 11 cwt. 1 qr. 20 lb. per acre; second prize, £5 5s., Mr. Alfred Brown, Millbrook, Southampton, 28 tons 5 cwt. 2 qr. 24 lb. per acre. Three acres of Webb's mangold, open to the counties of Oxon, Berks, Bucks, Wilts, Hants, Surrey, and Worcester. Prize, £10 10s., Mr. T. W. Purser, Tan House, Colnbrook, Slough, 56 tons per acre.

District 4.—Two acres of Webb's mangold, open to the county of Gloucester. Prize, £5 5s., Mr. Alfred Joyce, Hanley Farm, Chepstow, 48 tons 1 cwt. 1 qr. 20 lb. per acre.

District 5.—Five acres of Webb's swede, open to the county of York. First prize, £10 10s., Mr.

NOVA SCOTIA

Offers advantages to British Agriculturists with moderate capital. Improved Farms at Low Rates. Fertile Lands. Famous Fruits. Enormous mineral deposits of Coal, Gold, Silver, Iron, Copper, Lead and Tin. Climate temperate and healthy. Easily accessible to all the principal markets. Full information supplied by the Agent-General for Nova Scotia, Mr. JOHN HOWARD, 57A, Pall Mall, London, S.W.

GALVANIZED ROOFING SHEETS, WIRE NETTING, COMPLETE ROOFS AND BUILDINGS, IRON FENCING, RAILS, GATES, TANKS, CORN BINS, TUBES, ROOFING FELT, RAILING, FENCING WIRE, BARR WIRE, VARNISH, AND POULTRY APPLIANCES.

CATTLE WASH.

Used on the Herds of H.M. the King.

What it will do.

CUTOXINE removes all dirt, prevents Scurf, improves the coat, promotes abundant growth of hair, prevents skin diseases, cures Ringworm, and destroys Lice and all parasites.

What it has done.

Testimonial from A. J. Thomas, Esq., Rodmerham, Sittingbourne.

Dear Sirs,—As an exhibitor at the Royal and other Shows, I have used 'CUTOXINE' Wash with excellent results.

It gives the animals a beautiful coat, and keeps the skin very healthy.

Fertilisers and Feeding Stuffs.

USEFUL INFORMATION FOR FARMERS WHEN BUYING.

Approximate Unit Cost of Fertilising Constituents.

It is necessary for guidance in the economical use of fertilisers, and especially in the purchase of Complete and Special Manures, that the relative unit cost of the principal fertilising constituents should be studied: the subjoined table affords information on this subject. By multiplying the guaranteed minimum percentages of a fertiliser by the unit costs given in the table, the buyer will get a good idea of the commercial value of any chemical manure offered to him. The unit values are subject to variations from time to time, and in this respect we shall endeavour to keep the table up to date, besides which, buyers living in remote districts may have to pay a little more for heavier cost of delivery. If credit is required, this will also add to the cost.

	Peruvian Guano.								Basic Slag.	Bone Com- pounds.	Special Man- ures.	Kainit.	Sul- phate of Potash.	Muriate of Potash.
	Raw or Equal- ised.	Phos- phatic.	Dissol- ved (solu- ble).	Nitrate of Soda.	Sul- phate of Am- monia.	Bone Meal.	Super- phos- phate.							
	s. d.	s. d.	s. d.	s. d.	s. d.	s. d.	s. d.	s. d.	s. d.	s. d.	s. d.	s. d.	s. d.	s. d.
Ammonia, organic as in Guano and Bones	15 0	12 6	15 0	—	—	12 6	—	—	—	15 0	15 0	—	—	—
„ in Sulphate of Ammonia ...	—	—	—	—	10 6	—	—	—	—	—	12 6	—	—	—
„ calculated from Nitrogen in Nitrate of Soda ...	—	—	—	13 0	—	—	—	—	—	—	—	—	—	—
Phosphate soluble in water ...	2 0	—	2 0	—	—	—	2 0	—	—	2 0	2 0	—	—	—
„ assimilable ...	1 3	1 2	1 3	—	—	1 2	—	—	—	1 3	1 3	—	—	—
„ insoluble ...	—	—	—	—	—	—	—	1 3	—	—	—	—	—	—
Potash (pure) ...	4 0	4 0	4 0	—	—	—	—	—	—	—	4 0	3 10	4 0	3 1

N.B.—The above table is based on the commercial cost of the fertilising constituents. Agricultural value is not always synonymous with the commercial cost, and every farmer must exercise his judgment, while considering the cost, which fertiliser may be expected to give the most profitable return on his soil and for his crops. This is the cheapest manure for him.

Approximate Unit Cost of the Nutritive Constituents in Feeding Cakes and Meals.

Cakes and other Feeding Stuffs.—In order to be able to form a correct opinion of their value, it is necessary to know the relative cost of the different nutritive constituents. The following note, by an eminent authority, supplies this information. By reference to it, a farmer can calculate out the approximate commercial value of a cake or meal, and then use his judgment as to which is most suitable for his special requirements.

June, 1906.

Albuminoids ...	...	...	...	...	...	s. d.	s. d.
Oil or fat ...	...	...	...	...	...	2 8	3 0
Carbohydrates	...	...	...	...	...	1 1	1 2

NOTE.—Most authorities in England are agreed that the value of each percent. of unit of albuminoids, and of oil is at least 24 times that of 1 per cent. of unit carbohydrates. If, therefore, the percentages of albuminoids and oil in a feeding stuff be respectively multiplied by 24 and added to the percentage of carbohydrates, the total feeding units contained in the article are obtained. The cost of the feeding stuff divided by this total of feeding units gives the price per unit. Example: A cotton cake contained

				Per cent.			Feeding units.
Albuminoids	...	...	...	22.1	×	2½	= 55.2
Oil	...	...	...	5.2	×	2½	= 13.0
Carbohydrates	...	...	...	33.2	×	1	= 33.2

Total feeding units	...	...	101.4
---------------------	-----	-----	-------

The price of the cake being £5 7s. 6d., the cost per feeding unit was just about 1s

Note to Regular Subscribers.

We may remind our readers that we are prepared to analyse free of cost for our regular subscribers, who are farmers, and not in trade as vendors of fertilisers or feeding stuffs, samples of minimum lots of 2 tons of either article, in cases where there is solid reason to suspect an attempt to defraud. The analyses are published, under a *nom de plume*, in the paper.

We are also willing to publish replies in these columns to inquiries relating to the quality and use of fertilisers and feeding stuffs.

Improving Meadows and Pastures.

In connection with this important matter, the National Agricultural Society of Germany have sent out to all their members a circular, the contents of which are equally applicable to this country. It is pointed out that the best time for applying fertilisers is from the present time up to the middle or end of February. For meadows, phosphate of lime and potash form the chief requirement, and a regular annual application to all meadows of ordinary character is very advantageous.

The phosphate of lime can be applied either in the form of basic slag or superphosphate, whichever is locally cheaper, and on soil rich in humus bone flour or bone ash can be applied with much benefit.

The potash can be best applied as kainit, excepting where the cost of carriage is very heavy, and then the more concentrated sulphate of potash should be used.

The application of phosphate and potash not only increases bulk of yield, but also greatly improves the nourishing quality of the yield on all ordinary soils. The exception is grass on acid and clay, which sometimes does not respond to dressing with fertilisers. On such doubtful soils small experiments should be made to test the effect of fertilisers before any heavy expenso is incurred. For the most part it is not profitable to apply nitrogen, at the present high prices, to meadows, except perhaps 1 cwt. nitrate of soda in the spring or the same quantity of sulphate of ammonia in the

autumn if the grass is poor from the soil being impoverished.

An ordinary crop of $1\frac{1}{2}$ tons of hay takes from the soil 60 lb. of potash, 12 lb. phosphoric acid, and 49 lb. of nitrogen.

In conclusion, the circular calls attention to the unwelcome circumstance that the prices of almost every fertilising material are moving upwards, and members are recommended not to postpone securing without much delay the approximate quantities they expect to require.

What is the Best Time to Sow Wheat?

This is a query often put forward but difficult to answer in any categorical manner, because there can be no fixed rule on a subject which is dependent on so many factors. On chalky, light soils, subject to drought, the operation should be done early in autumn, because the plant has to hurry up in its growth before the little moisture in the soil is exhausted in May or June. On deeper soils, which retain more moisture, the sowing may be delayed, according to convenience, until later in the autumn or early winter, as there is not the same risk of drought, and the crop has more time to develop to fruitful maturity. The variety of grain has also to be considered, early varieties should be sown somewhat late. But, after all, where there are so many different points to consider, it must be left to each grower to judge from local experience and local conditions what is the best time. Before all things, however, the grower should be careful to select good seed.

Analysis of Fresh Sea Weed.

Water	...	...	63.49
Organic matter	...	...	27.93
Ash or mineral matter	...	...	8.58
			100.00
Nitrogen	...	...	0.466
Phosphoric acid	...	...	0.108
Potash	...	...	2.025

The value of sea-weed as a fertiliser is due to its large percentage of potash and the readiness with which the organic matter decomposes in the soil, liberating the constituents in forms available to crops.

Maize Meal for Pigs.

The Association of Pork Butchers in Holland have recently published the results of some trials conducted at several Government experimental stations with the object of testing the relative value of different meals, especially maize meal, barley meal, oatmeal, and buckwheat meal for the fattening of pigs.

The trial was made with forty-eight young pigs, all of the same age and weight, divided into three lots. The animals of each lot received respectively as much as they would eat of the different meals, and in addition they all had daily a supply of skim-milk and some potatoes. After they were killed, an examination of the carcasses showed that the flesh of the pigs fattened on maize was not so firm or saleable as that of the pigs fed on the other meals. This result is the same as has been reported from trials in America and Canada, and is worth noting. It would appear that maize is a good food for growing pigs, but that other meal should be substituted, either in part or altogether, during the last month or two of the fattening process.

Manuring Orchards.

The advantage of maintaining the soil of orchards in a fertile condition is now recognised and is being acted upon; but still, too often, the orchard is neglected in this respect. Crops of fruit are annually picked, carrying off a proportion of plant food, especially phosphoric acid and potash, and unless the constituents are returned the fruiting capacity of the trees must certainly diminish.

soil every three or four years, and the best time to apply it is in the late autumn or winter, so that the rains can wash it in. In the season that farmyard manure is not applied the orchard should have a dressing of artificial fertilisers. Slowly acting fertilisers, such as bone meal, granular bones, basic slag, should be applied in late winter at the rate of 3 cwt. per acre, and, in spring, when the trees begin to show signs of renewed life, 1½ to 2 cwt. of nitrate of soda or sulphate of ammonia may be applied with benefit.

France employs for agricultural purposes 41,000 tons of potash salts, containing 11,000 tons of pure potash. This is nearly three times as much as was used ten years ago.

Crushed Granite as a Fertiliser.

The proposal to use crushed granite as a fertiliser is being again raised, chiefly for its percentage of potash. This is rather an old story, as in Germany it was tried and sold as a fertiliser many years ago under the name of "stone meal"; whilst in 1902 a series of experiments were carried out in order to investigate whether the potash in a mineral fertiliser which was prepared in Sweden was of any manual value, but very unfavourable results were obtained, as the manure proved to be ground felspar, of which the percentage of potash was 8.15.

This experiment was carried out on grass. In May, 1902, all the plots were sown with a mixture containing red clover, alsike, white clover, and timothy grass. The experimental series were of the size of one square metre and consisted of eight plots, four being check plots.

The manures applied were as follows:—
Plot (1) 54 lb. of phosphoric acid alone in 357 lb. basic slag per acre.

Plot (2) 54 lb. of phosphoric acid and 89 lb. potash in potash manure salt per acre.

Plot (3) 54 lb. of phosphoric acid and 89 lb. potash in ground felspar per acre.

Plot (4) 54 lb. of phosphoric acid and 178 lb. of potash in ground felspar per acre.

The average yield of green vegetable matter in the first year of two parallel plots of one square metre each was:—

1. Without potash, 1.20 lb.; increase due to potash.

2. With 89 lb. of potash as potash manure salt, 4.53 lb.; increase due to potash, 3.33 lb.

3. With 89 lb. of potash as ground felspar, 1.69 lb.; increase due to potash, .49 lb.

4. With 178 lb. of potash as ground felspar, 1.96 lb.; increase due to potash, .76 lb.

Comparing plots 1 and 2, it is noticed that the produce from plot 2 was nearly four times that of plot 1, this being due to the application of the potash manure salt. When comparing plot 1 with 3 and 4, it is noticed that the two latter give a slight increase over plot 1, but this increase was inconsiderable, and stood in no comparison to the increase due to potash manure salt in plot 2.

In 1903 the manuring was repeated in the same way, and during the growing period the difference in vegetation on the four different plots was distinctly perceivable. The timothy grass on the plots not manured with potash or with ground felspar was poorly developed; wanting in sap, the leaves were bent towards the ground, of a pale-green colour, and many white or yellowish spots were noticeable where the chlorophyll had been destroyed. The clover also had white and yellow spots on the leaves, these spots increased in numbers as the time went on. It was also noticeable that the leaves of the clover gradually decayed from the borders towards the centre. On the plots manured with potash as ground felspar the clover was a little better than on the unmanured plot, whilst on the plots manured with potash manure salt the timothy grass grew upright, showed vigour, the leaves of green colour, of good nourishing character. These experiments, besides showing the value of potash for clover crops, established at the same time the worthlessness of ground felspar as a potassic manure. As has been previously stated, crushed granite was tried as a manure in Germany many years ago; and to show what value was attached to it, the following case may be interesting. In the German *Agricultural Press*, No. 9, 1901, an interesting article occurs in which it is stated that a merchant, Mr. Hermann Betfels, of Halle a/S, brought an action against a certain farmer's widow who refused to pay for a so-called mineral manure, namely, "stone meal," which had been supplied to her by this merchant and had proved by its application to be worthless. The merchant lost his case, and had to pay all the expenses of the trial, the court deciding that the "stone meal" was no mineral manure at all. According to this decision, no farmer in Germany need pay for the "stone meal" sold to him as a mineral manure, as it does not deserve the name of mineral manure at all.

In the *Deutsche landwirtschaftl. Presse*, No. 35, 1901, an article appeared in which the value of ground porphyry as a mineral manure, or for spreading over farmyard manure as a preservative, is considered. A decisive answer is given by Professor Wagner, who states: "Hensel's stone-meal," which has been offered latterly under the name porphyry meal, and has been recommended latterly as a preservative for farmyard manure, has no effect at all, whether for a preservative or applied to the land, and any farmer who buys porphyry meal certainly loses the money which he pays.

In the *Deutsche landwirtschaftl. Presse*, 1899, No. 13, a short article occurs with regard to the meeting of the Agricultural Committee for the Province of Saxony, in which they warn farmers against buying "stone meal." They state that every farmer who does not wish to throw his money out of the window should not be led by any publications, or the sellers or their agents to buy this worthless material.

In 1899 Professor Dr. B. Schulze analysed these

so-called mineral manures, "stone meal," in nine different instances, and in every case it was proved that it contained only a very slight proportion of the important plant-foods, phosphate and potash, in an available condition, hardly any signs of nitrogen, and changing quantities of lime, generally in the form of carbonate of lime.

From these various instances it may be seen that ground granite or stone meal is worthless as a mineral manure for the application of potash.

With the application of ground rock as a manure it is true that a large amount of insoluble potash would be left in the soil. It would not be much greater value than the finer parts of soil itself, and what would you think of the proposition of a neighbour to pay him 20s. a ton for fine soil, and spreading it on an acre of your land (20s. per ton being stated as the price at which ground granite could be obtained after freight, &c.)? It need not be pointed out that farmers do not wish to lock up a large amount of plant food in the soil especially if they need to make money out of it.

We may safely conclude that a pound of potash in crushed rock is no more equal to a pound of potash in muriate of potash than an ounce of sugar in sugar-beet pulp is equal to an ounce of pure sugar. No one would think of putting the pulp in his tea for its sugar, and the same may be said of applying crushed rock to the plants for its potash.

Professor Fraps, of the Texas Experiment Station, states that the fertilising value of potash in crushed granite is less than one-fourth of that in potash salts, such as muriate or sulphate of potash. This shows the large amount of the crushed rock which would have to be applied to soil in comparison with potash salts.

In the same way it may be suggested that sawdust might be used in the place of stable-manure, as by analysis sawdust contains plant food.

But what farmer in his right mind would accept a pound of nitrogen in sawdust instead of a pound in well-rotted manure? It would be possible to extend this discussion and give other illustrations of the folly of attempting to substitute this insoluble rock potash for the soluble potash salt. There is nothing in the proposition for this generation of practical people at least, and the wise farmer will continue to use the old reliable muriate, sulphate, and kainit as a source of potash.

Correspondence.

DEAR SIR,—I am a farmer and have used compound dressing cakes for twenty years, and I have become a yearly subscriber to the MARK LANE EXPRESS. I have bought three different makes of two ton lots for present use, and I wish you to analyse them for me. They are marked 1, 2, 3. There is a few shillings difference in price per ton. Give me their separate market values and oblige.

—Yours truly, J. B.
[We take it for granted that our correspondent, as a prudent and businesslike man, has bought the different cakes with a guaranteed analysis as regards purity and the contents of albuminoids, oils, and carbohydrates. It will, therefore, be a simple matter for him to calculate out the relative values of the three cakes. We may refer him to our note on "Approximate unit cost of nutritive constituents," on page 522 of last issue, and to the full details given on this subject in our issue of October 1.]

We are pleased to note that our correspondent has become a regular subscriber to the paper, and are sure it will be useful to him.]

Somerset County Council.

The October report of the Agricultural Instruction Committee shows that the good work undertaken by the committee is making steady progress.

Experiments to test the effect of different fertilisers on hay and sward crops are being continued. Lectures and lessons in Nature study, botany, butter and cheese-making, bee-keeping, are being given, and there is general activity in other directions.

During the past quarter five samples of feedings-stuffs were tested; of the cotton-cakes one was of very poor quality, containing over 30 per cent. of indigestible fibre. Such a mass of indigestible material is a very serious drawback to the use of the cake. Farmers should insist on a guarantee of 20 per cent. maximum, and reject parcels containing a higher percentage.

Bonus for Mineral Phosphate Producers.

The *New Zealand Gazette* of July 12 announces that a bonus is offered for the discovery and working within the colony of New Zealand of a deposit or deposits of marketable mineral phosphate. —£500 if on Crown lands; £250 if on freehold land. The conditions under which the bonus is offered and will be paid are contained in the *Gazette*, which may be seen at the Commercial Intelligence Branch of the Board of Trade, 73, Basinghall Street, E.C. Applications addressed to "The Hon. the Minister for Agriculture, Wellington" will be received up to and including March 31, 1907.

Fertiliser Experiments in Ireland.

Under the supervision of the Department of Agriculture a series of field experiments was started in the year 1901, and has been continued on a gradually increasing scale each year, so that in 1905 experiments were conducted in twenty different counties in various parts of Ireland. In the October issue of the departmental journal the results of the experiments for the five years—1901 to 1905—have been collected and condensed.

The crops experimented with have been the usual rotation crops—oats, turnips, mangels, and potatoes, barley and flax and meadow hay; the varieties grown were those usually grown by the farmer, so that the average results may be regarded as representing the results which would be obtained under similar conditions in the usual farming practice of the country.

The report includes carefully-compiled tabular statements of the details, and diagrams enabling the student of the report to see at a glance the pith of the results. These particulars are highly interesting, but what our readers will chiefly like to know is, what fertilisers or mixture of fertilisers produced the most profitable results?

Oats.—The best average results were obtained by a dressing of 1 cwt. sulphate of ammonia, 3 cwt. kainit, 3 cwt. superphosphate at a cost, including application, of 32s. per acre, the profit being £2 10s. 3d. per acre. The mixture is equal to a dressing of 7 cwt. of an artificial manure, analysing—

3½	per cent. of ammonia,
11	" of soluble phosphate,
5½	" of potash (pure).

Costing, at to-day's prices, about £5 per ton.

Turnips.—The best results were produced by a dressing of 10 tons farmyard manure, supplemented by 1 cwt. sulphate of ammonia, 3 cwt. kainit, and 3 cwt. superphosphate, costing for artificial £1 11s. 6d. including application, net profit of crop being £2 2s. 6d. per acre. The artificials represent 8 cwt. of manure, analysing—

3½	per cent. of ammonia,
13	" of soluble phosphate,
5	" of potash (pure).

Costing £4 10s. per ton.

Mangels.—The best results were produced by a dressing of 15 tons farmyard manure, supplemented by an application of 2 cwt. sulphate of ammonia, 4 cwt. superphosphate, and 4 cwt. common salt, costing, including application, £2 6s. 6d., the profit being £4 7s. 9d. per acre. The artificials represent 6 cwt. of fertiliser, testing 8 per cent. of ammonia and 17 per cent. of soluble phosphate, costing about £7 per ton, and 4 cwt. salt extra.

Potatoes.—The best results were from a dressing of 15 tons farmyard manure, supplemented by an application of 1 cwt. sulphate of ammonia, 1 cwt. muriate of potash, 4 cwt. superphosphate, costing, including application, £1 13s. 6d., and leaving profit £6 4s. 6d. per acre.

The artificials represent 6 cwt. of a fertiliser, analysing—

17	per cent. of ammonia,
9½	" of soluble phosphate,
9½	" of potash (pure),

costing to-day about £6 10s. per ton.

Barley.—The best results were produced by a dressing of ½ cwt. sulphate of ammonia, 3 cwt. kainit, and 3 cwt. superphosphate, costing, with application, 25s., and leaving profit of £2 6s. 6d. per acre. This represents a dressing of 6½ cwt. of a fertiliser, testing:—

2	per cent. of ammonia,
12	" of soluble phosphate,
6	" of potash (pure),

costing at £4 10s. per ton at to-day's prices.

Meadow Hay.—The best results were produced by an application of 1 cwt. nitrate of soda, 2 cwt. kainit, and 2 cwt. superphosphate, costing with application £1 3s., and leaving a profit of £1 14s. 9d. per acre. This is equal to a dressing of 5 cwt. of a fertiliser, testing nitrogen equal to 3½ per cent. ammonia, 10 per cent. soluble phosphate, 5 per cent. potash (pure), costing at to-day's prices about £5 per ton.

It will be observed that in carrying out these experiments sulphate of ammonia—with one exception—and superphosphate have been selected as sources of ammonia and phosphate of lime. This is no doubt in order to simplify the calculations, and one must not infer therefrom that other materials, such as nitrate of soda, basic slag, guano, &c., would not produce equally good results.

Another point to be noted is the confirmation of the advantages of application of the three combined ingredients—ammonia, phosphate, and potash.

As a summary of the whole experiments, the Department of Agriculture draw the following obvious conclusions:—

(a) The profits from all crops may be very largely increased by the addition of a suitable mixture of artificial manures.

(b) Tillage crops yield a higher return than meadow hay and permanent pasture.

(c) Root crops yield the highest returns, fodder crops coming next.

Who Invented Margarine?

To a French chemist, Monsieur Mège-Mouries, belongs the honour—if it can be so called—of having invented the substance known as margarine. This was probably about the year 1861, and, shortly after, a factory for its manufacture was started in a suburb of Paris. This was done by Mons. Mège-Mouries at the suggestion of Napoleon III.

The invention was patented, according to some details given in the *Chemical Trade Journal*, in England by Mège-Mouries in 1869, and in the United States in 1873. But the manufacture of margarine had already commenced in the United States, and the new industry seemed to promise well. With characteristic acuteness in quickly discerning the value of a new process with money in it, the American manufacturers at once bought this patent to protect themselves. In the course of time the manufacture of butter substitutes reached considerable proportions in the United States. Connected, as it naturally always has been, with the meat industry, it increased as that industry increased. The Federal Government recognised in it a rival, to a certain extent, to the manufacture of genuine butter, and also a means of adding to the inland revenue. Laws were therefore passed by the Federal Government imposing taxes and regulating its sale.

During the last three years we have been importing butter substitutes from the United States

at an average rate of about 5,000 tons yearly, thus:—

In the Year	The total Quantity of Butter Substitutes made in United States was	This country took
1903	79,746 tons	4.1 p.e. of this.
1904	80,275 tons	6.1 p.e. of this.
1905	96,131 tons	7.3 p.e. of this.

"Process butter" is butter of an inferior quality that has been treated to make it palatable. "It may be assumed that the object of subjecting a lot of butter to such a process is to remove rancidity, sourness, mould, or other fault or feature that has impaired its merchantable quality." So say the "rules and regulations" prescribed in regard to "renovated butter" (or process butter). No doubt this assumption is a perfectly correct one. Nevertheless, whatever may be nature of the products obtained by working up bad butter in this way, the action of the Canadian Government in forbidding this sort of thing to be done in the Dominion will be fully appreciated, even if only looked at from the point of view of the reputation of the dairy industry there.

The great advance in the cost of bags is being seriously felt by chemical fertiliser manufacturers. At a recent meeting of a large chemical manure company the chairman stated that the higher cost of bags would involve an extra outlay of £2,000 during the coming year.

Prices of Fertilisers.

As the season for the purchase of fertilisers is now at hand, we shall give weekly for the next few months the London prices of the principal articles.

The quotations are approximate and free on rail, London, cash payment.	£ s. d.
Nitrate of soda prompt delivery	11 17 6
..... forward	12 2 6
Sulphate of ammonia 12 15 0	
Superphosphate, 26 per cent 2 10 0	
..... 35	3 6 3
Pure dissolved bones 5 7 6	
Bone compound ordinary 3 8 9	
Ground hoofs, 17 per cent 9 10 0	
Fish guano, first quality, scarce & dear	6 12 6
Kainit 2 5 0

THE

"BIBBY" CAKE

IN THE FORM OF

"CAKETTES."

"Send me two tons o' they nobbs same as Mr. Brown is a using," was the colloquial way in which a new customer gave us an order the other day through our Market Representative.

This buyer had often thought he would like to try the "Bibby" Cake, but he belonged to the old school of farmers who are not easily led along untrodden paths.

He had, the previous week, been paying a visit to his neighbour, Mr. Brown, who had often spoken favourably to him of our Cake, and on looking over his Stock and noting the extreme handiness of the "Cakettes" for Summer Feeding, he at last resolved to give us a trial order, and did so in the words just quoted.

It was doubtless the good condition of Mr. Brown's Cattle and the manifest handiness of the "Cakettes" which had finally broken down this buyer's conservatism: and now we have received a trial order we shall take good care to retain his business. Our method is a simple one: We put such value into all our Cakes and Meals as will insure the best results obtainable.

THIS IS THE TRUE SECRET OF OUR SUCCESS.

It is, perhaps, hardly needful to point out in this place that the "Bibby" Cake is the most popular brand of Cake that has yet been made, and no other explanation but the one above mentioned will explain this fact.

It is not well, therefore, for buyers to be put off with a Cake which is offered as something "just as good": it is much better to say to the Cake merchant: "I must have 'Bibby,' and will not take a substitute."

The "Bibby" Cake has steadily won its way to

THE PREMIER POSITION**IN THE PUBLIC FAVOUR,**

and of all the Cakes on the market is admittedly the best. In the form of "Cakettes" it is also the handiest; there is this further to be said about it:—the more carefully it is tested against other competing Cakes, the more certainly and with increasing emphasis will be the reply to those who offer a substitute:—"I MUST HAVE 'BIBBY,' PLEASE; THAT IS THE CAKE I WANT, AND I WILL TAKE NO OTHER."

COMPENSATION FOR DAMAGE BY GAME.

During the debates on the Land Tenure Bill it has been repeatedly stated that Section 2 does no more than declare the common law, and

simply renders inalienable a right to compensation already existing. Is this correct? If so, why not curtail the discussion of the Bill by withdrawing this highly contentious, but apparently superfluous, clause?

The words of the section, as introduced into the House, so far as they are material to the present question, are as follows:—

"Where the tenant has sustained any damage from game that he has not the lawful right to kill, he shall at any time during the tenancy be entitled to compensation from his landlord for such damage, and any agreement to the contrary shall be void."

The concluding words, according to some exponents of the Bill, are really the only operative words of the section, as the right to compensation already exists. Let us examine the authorities on which this assertion is based.

In the case of *Barrow v. Ashburnham* (decided in 1835) the farmer, previous to becoming tenant, had a conversation with the agent, in which he said, "I have no objection to take the farm if the game is destroyed; I don't care so much about the birds as the hares and rabbits," to which the agent replied, "Why, you are a man who keeps no dog and uses no gun, and you must let the keepers know and they will

kill them." The farmer rejoined, "Then upon these terms I will take the farm." The landlord failed to keep down the hares and rabbits, and the tenant recovered damages.

This was followed in 1873 by *Erskine v. Adeane*. Before taking a farm, the applicant complained of the quantity of game upon it. The landlord replied that he was about to kill and keep down the game and to dismiss most of his keepers, and discontinue letting the shooting; but made some excuse for omitting this arrangement from the lease. The tenant, however, relied upon his landlord's verbal representations, and accepted the lease on the faith of them. The landlord afterwards re-let the shooting, and a large stock of game was kept up. It was held that the tenant was entitled to compensation for damage done by the game.

In 1885 a Westmoreland farmer recovered damages in the case of *Farrer v. Nelson* in the following circumstances. He was tenant of a farm (exclusive of woods and coppices thereon) under a lease which reserved the sporting rights to the landlord. The landlord let his rights to a shooting tenant, who reared about 1,500 pheasants in coops on another part of the estate, and brought a large number of them to a coppice about 80 acres on the farm. About an acre

of the coppice, some five yards from the field where the damago was done, had been cleared for rearing pheasants, and into this the imported pheasants were brought. As many as 100 pheasants at a time had been seen in the farmer's corn. It was held that the farmer was entitled to recover compensation from the shooting tenant (not from the landlord) for the damago done.

Now it will be noticed that in the first two cases there was evidence of an express agreement to keep down the game; and the farms having been taken on the faith of such agreements, and on those representations it would have been contrary to the ordinary rules of justice if the tenants afterwards had no remedy. In the third case the decision turned on the fact that the damago was done by an artificial, rather than a natural, growth of game—*ie.*, by imported pheasants, and not those reared naturally on the land. The right of a landlord to refrain from keeping down game bred naturally on the land was, in fact, expressly recognised by Baron Pollock, who tried the case, in the following words:—

"There is no doubt that every person has a right to keep on his land such game as would be usually bred upon it. It may be a law which is peculiar to this country, and has arisen out of our feudal laws. The moment, however, at which that which was right

in law, when naturally done, is exceeded, the right at once ceases. So long as a sporting tenant exercises his ordinary rights—namely, those which the landlord might himself have exercised—he cannot be made liable for injury done by his game; but when he seeks to do more, and brings game of an unusual amount on the land, and thereby increases the amount by what I may call non-natural means, he is seeking to enjoy a right which is not given him by his landlord—because his landlord could not enjoy such a right himself—and an action will lie for any damage caused thereby to his neighbours."

It will be seen at once that the words of the Act go very much further than the decisions quoted, and will, in fact, effect a drastic alteration of the law. But the landlord's liability will be confined to damage by game which the tenant has not the lawful right to kill. All liability will therefore be avoided by omitting to preserve the game. The tenant may have to pay more rent in consequence, but if he chooses to divest himself of his sporting rights he can let his shooting, and apparently there is nothing to prevent him re-letting it to the landlord by a separate agreement and at a specified rent. It seems to be possible for landlords thus to evade liability under the Act, and yet continue to enjoy the shooting. Estate agents may take the hint.

Notes of the Week.

Mr. Frederick Snowden Corrance, a Suffolk agriculturist, whose death is announced, held the championship for illegible handwriting since the death of Dean Stanley.

The story goes that a compositor, on a now defunct local paper, threw down his "stick" and enlisted as a soldier rather than wrestle any longer with what looked like Hebrew or Chaldean in Mr. Corrance's caligraphy.

Our sympathies are entirely with the compositor, for we ourselves have done some similar wrestling, and the victory has not always rested with us, as we have subsequently found out by the not altogether complimentary remarks of those whose caligraphy we have tackled.

Who can now say that our faithful Commons do not devote time to agricultural matters?

In the course of the debate on the Land Tenure Bill they burnt (metaphorically speaking) the midnight oil and saw the grey dawn creep in through the windows, while they discussed, debated, and wrangled over the relative interests of tenant farmer and landlord.

The Bill will now pass to the Upper Chamber to be subjected to the vivisection knife of our hereditary legislators.

The project for importing foreign cattle to one of the Channel Islands is not dead, but only scotched. It is still necessary to keep a watchful eye on the matter.

What is cider? There is a radical difference of opinion. The consuming public think it should be the pure juice of the fruit. Some vendors seem to be of the opinion that it may be any decoction, from which the most profit can be realised.

The Board of Agriculture should take the necessary measures to get a legal definition, so as to protect the makers of the genuine article and the public.

The course of five lectures on "artificial manures" which Mr. A. D. Hall is delivering at the Society of Arts may be regarded as evidence of the increasing general interest being taken in scientific agriculture.

Mr. Hall, the present director of the Rothamsted Experimental Station, formerly principal of the South-Eastern Agricultural College, is admirably adapted to the task he has undertaken.

He has the gift of making the dry bones of agricultural experiments rattle with apparent vitality.

In passing, the use of the word "Fertilisers" may be noted. The old-fashioned term "chemical manures" is being gradually abandoned.

The term "manure" is being relegated to express "farmyard manure," or bulky, rough substances, such as "shoddy," &c.

All the same, the word "manure" has a good old Norman origin, being derived from the Norman "mainoverer," meaning "to cultivate with the hand."

The old Saxon word was "muck." Thus Bunyan writes of the man "with the muck-rake."

Chicago is keeping up its reputation. Some of the samples of Chicago brawn examined in Marylebone during the September quarter were found to be "filthy, containing straw, fibre, hair, hogs' bristles, and dirt."

The motor exhibition is worth a visit, as it shows how useful motor-traction will gradually become for agricultural purposes.

But it is not necessary to visit the show in order to see motors make exhibitions of themselves.

The population of the little Republic of Switzerland are in a great state of mind—having suddenly become alive to the fact that there is scarcely three weeks' supply of wheat in the country.

The scarcity is caused chiefly by the unprecedented fall in the level of the Rhine, preventing supplies by water.

Switzerland is like England in this respect, that it is dependent on imported wheat to feed its population.

The position affords a moral for us. If our supplies by water were cut off by some unexpected cause, what would happen?

The small acreage under wheat in this country is the weak link in England's chain of defence.

If anyone has a recipe for encouraging hens to lay eggs during the winter months, now is the time to advertise it.

"Every dog has its day," but it may be hoped that the days of the vagrant sheep-worrying dog will be cut off by the advent of the new Act.

Sad is the end of Park Royal, Limited: A child, ushered into the world a few short years

THE FARMERS' DIARY.

TUESDAY, NOVEMBER 20.—Annual Meeting of the Royal Statistical Society at the Society of Arts, Adelphi, 8 p.m. Abergavenny and Carmarthen Agricultural Fairs—Wirksworth Cattle Fair—Entries to be sent in for the Chichester Fat Stock Show—Entries of Bristol Fat Stock Show to be sent in.

WEDNESDAY, NOVEMBER 21.—Chichester "Great" Market—Malmesbury, Castleton, Barnet, Tattenhall, and Ashton Agricultural Fairs—Penrhyn Cattle Fair—Stanhope Fair—Raynbirds Agricultural Sale at Basingsstoke.

THURSDAY, NOVEMBER 22.—Norwich Fat Stock Show, first day—Garstang, Scarborough and Monmouth Cattle Fairs.

WEDNESDAY, NOVEMBER 23.—Norwich Fat Stock Show, second day—Louth, Darlington, and Bawtry Cattle Fairs—York Horse and Cattle Fair—Marlborough Horse and Sheep Fair—This is St. Clement's Day, on which many small fairs are held in the more rural districts—Peterborough Horse Sale.

SATURDAY, NOVEMBER 24.—Norwich Fat Stock Show, last day—Special Sale of Store Stock by Messrs. Ireland at Norwich—Rickmansworth Agricultural Fair—Alfreton and Gloucester Cattle Fairs—Entries for the Plymouth and Western Fat Stock Show to be sent in—Entries for Vale of Aylesbury Fat Stock Show to be sent in.

MONDAY, NOVEMBER 25.—Pickingering Cattle, Sheep, and Pig Fair—Leek Fair—Norwich Fair—Liverpool Horse and Cattle Fair—Newton Sheep and Pig Fair.

TUESDAY, NOVEMBER 27.—Horsham Fat Stock Show—Viscount Tredegar's Agricultural Show at Newport—Ipswich Horse Show—Uttoxeter Horse Sale—Bromsgrove Cattle Fair—Newtown Horse and Cattle Fair—Rugely Agricultural Hiring Fair.

ago with great hopes, it will probably have ended its existence by the end of the year.

What will its epitaph be?

The Lincolnshire Farmers' Union, representing a very important body of opinion of Lincolnshire farmers, passed at their last meeting a strongly-worded resolution on the Army meat question.

Other farmers' clubs in different parts of the country are formulating similar protests, and the Royal, at their forthcoming general meeting, will have something to say on the subject.

The Government must begin to recognise that they are making a mistake in adopting an unsympathetic attitude in the matter.

Prize farm competitions on the Continent have proved to be a great success, and it is satisfactory to see that similar competitions are going to be again inaugurated by the Royal in connection with next year's show at Lincoln.

This is due to the generous action of the members of the local hunts, who are providing the funds for the prizes and the charges involved in judging, &c.

Giving evidence before the Royal Commission on Congested Districts in Ireland at Westminster, Mr. Bailey, Estates Commissioner, said that the holdings in the poorer parts of Ireland were worked by the occupying tenants in a way above what might reasonably be expected of them; that was to say, that no return was got for the amount of labour that was put in the land. In some parts of Ireland the most skilled labour would not yield anything on the soil.

There was a considerable shortage of farm servants seeking places at Wigton (Cumberland) Martinmas hiring on Tuesday. As the masters refused to give the high wages asked, hiring was slow, and wages were fully £2 down. Experienced men got to £16 for the half-year; second rates to £12; boys from £4. The growing disinclination of country girls to farm service was again observed. Only twenty-eight sought engagements in the hiring hall, where the highest wage was 10 guineas.

The hirings for single servants at Hexham were held on Monday when, the weather being fine, there was a fairly good attendance of masters and servants. Hirings proceeded slowly and quietly, but a good deal of business was done, men and lads being engaged on easier terms. Men had to accept less wages, from 10s. to 20s. less than last year; some men accepted 10s. less for more responsible positions, so that wages might be considered 20s. down. So late as two o'clock in the afternoon there were a number of men still unhired. Women and girls were more quickly hired and at full previous rates. Young lads received from £5 10s. to £9 according to age and ability, and men from £12 to £15 10s. for the half-year. Girls got from £4 10s. to £8, and experienced women from £9 to £14.

HORSES.

Notes and Jottings.

"He doth nothing but talk of his horse."
—"Merchant of Venice."

THE breaking up of such a stud as that of the late Mr. A. J. Brown, of Doncaster, is an historic event, and the sale held at the Salutation Paddocks at Doncaster on Wednesday last may well be described as the event of the week in the horse world. That there was a large crowd of Mr. Brown's friends it does not seem necessary to say, and so far as one could judge from the proceedings on the morning of the sale and the two previous days, there were a lot of buyers. From morning till night horses were being shown out and ridden and criticised, and a man who was there all the time told me that he should think Cycle must have been ridden twenty miles at the least on the Monday and Tuesday.

AN auction sale of horses is a very curious thing when one comes to look at it, and the best judges will find themselves wrong in their fore-

£3,000, and thirty-four of the best of the Hunter made an average of £74 1s. This was certainly disappointing, and perhaps the most curious thing in connection with the sale was that Wexford, a well-known prize-winner, only realised 96 guineas.

THE time at which a sale of wearing horses is held has a great deal to do with the prices which are made, and by wearing horses I mean geldings and mares which are intended to be worked straight away, the mares being such as are not described as high-class brood mares. Especially is this the case with hunters. For example, if Mr. Brown's horses had been sold a few weeks earlier or a few weeks later much better prices would have been brought. In mid November the hunting season is too young to permit of a big demand for hunters. Hunting men had replenished their studs earlier on, and it is too early for there to be great demand for show horses.

FOR breeding horses there is always a fair demand, high-class Shires especially being

SHIRE STALLION, RATCLIFFE CONQUERING KING.

Foaled in 1905, sire Lockinge Forest King, 18867, dam 3700 Ratcliffe Sunflower. Bred by and the property of Mr. F. Farnsworth, who won with it a First Prize at the Shire Horse Society's Show, and Second at the Royal Show this year.

casts. For instance, anyone looking over the catalogue of Mr. Brown's sale would at once have picked out Ruby as likely to make the most money. He has the best showyard record of any horse that was catalogued, and he stands out as the winner of a four mile steeplechase and as the only horse that ever beat Whiskey. This, one would naturally think, would have caused a run on him, and a brisk trade for him might reasonably have been expected. It is true that he has been fairly well crabbed on account of his temper, and that for many men he is none the better to like for the fact that he has been raced. But if he is a little excitable, surely there are plenty of men left who do not care for that. So I must admit that I was greatly surprised when he was started at 30 guineas, and when Mr. Walker had to work hard to get 175 guineas in the long run. I never saw biddings come so slowly for a high-class horse.

THE top price of the sale was made by Cycle, who may be said to have sold well at 200 guineas, though he was by no means dear. He is a beautiful horse—not up to a great deal of weight—and he is a very fine ride. When I saw him sold and how brisk the biddings were for him, I thought the sale would go well, and that good prices would be realised for the best of them. But it was only a flash in the pan, and dull trade and slow bidding was the order of the day.

ONLY five of Mr. Brown's horses reached the three figures, the other horses that did so being one in which Mr. Brown had a partnership. The three that made these good prices were Dainty, a very handsome bay mare for which Mr. John Lister gave 140 guineas; Brown Prince, a stylish horse and a well-known prize-winner, who was dirt cheap at 115 guineas; and Columbine, a nicely balanced mare, for whom Mr. Webb, of Stourbridge, gave the level money. Altogether the sale realised some

pretty certain to bring decent prices. So it is not surprising to find that there was a good sale of Shire horses at Peterborough on the same day that Mr. Walker was trying to coax a "little more money" out of his customers at Doncaster. West Wind, a two-year-old stallion, brought 255 guineas, a very good price, and the horse goes to the Warwick District Shire Horse Society. Ellies also sold remarkably well. Two two-year-olds, Sister Mary and Lawford Diamond made 140 guineas each, Mr. Yarborough taking the former and Mr. Dunn, of King's Newnham, the latter. Sister May, a yearling filly, was sold to Mr. Hawkins for 130 guineas, and Wantage Witch, a five-year-old brood mare made the useful price of 150 guineas. Foals sold well, making from 31 guineas up to 96 guineas, which price was given by Mr. Yarborough for a brown filly. So Shire horse breeders may be said to be finishing the year as well as they began it, and there will in all probability be another year of good prices.

I WAS talking to a master of hounds the other day and the conversation turned on the supply of riding and harness horses—riding horses, he it understood, not of the hunter type, and he made a suggestion which might, I think, be carried out with beneficial results. He said, with a considerable amount of truth, that the fashion of breeding hackneys up to a big size and as much as possible of the harness type was damaging the breed, and that there are fewer good horses bred in proportion to what there were five and twenty years ago.

SIX FEEDS FOR ONE PENNY—International Stock Food—is the Best Food for Cattle, Horses, Sheep, Pigs and Poultry.—Write for full particulars to F. C. SOUTHWELL & Co., LTD., 75, Southwark Street, London, S.E., or the Local Agents.—[ADVT.]

This, I think, may be generally allowed, and it is almost a natural consequence of breeding for an increase in height. Thoroughbreds have suffered for this as well as Hackneys, so have Cleveland Bays and Yorkshire Coach horses; and perhaps the only breeds that have not suffered from the fashion for "upstanding horses" have been the heavy ones. The suggestion was that with the idea of getting riding horses an Arab cross should be used with Hackneys. I think that a fresh infusion of direct Eastern blood could not but improve the modern Hackney considerably. In the first place, it would impart a style and quality which many modern Hackneys certainly do not possess. The shoulders would be fined down and properly placed, and there would be little or no loss of action. If there was trifling loss of action it would easily be got back in a generation or two. There is a great deal of Arab blood at the foundation of Hackney pedigrees and a fresh infusion of it could scarcely fail to have a beneficial result.

MANY of my readers will remember Mr. Pope's famous pony Magpie, who was perhaps the best of her height I ever saw. She was full of Arab blood. I have not her pedigree by me as I write, but if I remember rightly the Arab predominated over the Hackney strains in it. Yet, no finer mover ever went into a ring, and either in saddle or harness she was practically invincible. And she had a quality that very few of the Hackneys of the present day possess. She was a delightfully pleasant ride. Her well placed shoulders, fine shoulder action, and beautiful balance enabled her to "step up" without that rocking gait which is so unpleasant when one is "up," and which I take leave to think is also unpleasant. I once had a ride on Magpie, and was surprised at the good feel she gave me. I was not so surprised when I examined her pedigree closely.

IT is curious how ideas change about the feeding of horses. Looking through an old book the other day, I found a letter from an experienced agriculturist advocating the use of potatoes for horses. He spoke of their cheapness, their cooling properties, and that the use of them kept horses clear of grease, &c. He admitted carrots were better, but they were more difficult to grow and to store. My impression is that about the very worst food a man can give horses is potatoes. They are a bulky food in proportion to the nutrient they contain, and I am of opinion that instead of being cooling they are heating. That they make horses fat and sleek in skin is true, but I always think that the giving of potatoes to a valuable stallion once caused me heavy loss. My man was keen for his horse to look well, and gave him potatoes against my orders. The horse got fatter in the feet, and I always blamed the potatoes. THE LOOKER-ON.

The Late Mr. A. J. Brown's Hunters.

The whole of the well-known stud of show Hunters belonging to the late Mr. A. J. Brown was brought under the hammer at Doncaster, on Wednesday, by Messrs. Walker and Sons, of York. Mr. Brown was known all over the country as a breeder and judge of Hunters, and his success in the showyard were so remarkable as to be noted by all. Hence a large company was only to be expected at the dispersal of his stud, and the attendance quite came up to expectation, many famous owners of Hunters being either present or represented.

Bidding was not so keen as it might have been, but for the plums there was sharp competition and prices ruled high. The top price, 200 guineas, was paid for the Thoroughbred gelding Cycle, a six-year-old like to a good like, and a winner at both the Peterborough champion, and a winner at both the Peterborough and the Lincolnshire show, reached 175 guineas. A bid of 140 guineas for Jainty was accepted, and Brown Prince changed hands at 115 guineas, while Milton, a seven-year-old son of Imprevu, was a bargain at 110 guineas. The two seven-year-olds averaged £101 17s. each, the six-year-olds changed hands at an average price of £74 8s. each, and the five-year-olds were sold at an average of £77 14s. each, whilst the total for the sale was 2,533 guineas.

Clydesdale Horse Society.

A meeting of the council of the Clydesdale Horse Society was held in Glasgow on Wednesday, when Mr. Robert Brydon submitted a report of deputation to the Board of Agriculture, and it was agreed to represent to the Board that, in the opinion of the council, the interests of draught horse breeders were not being sufficiently regarded.

Intimation of the award of medals donated to various societies was received, and it was agreed to grant a donation of £10 towards the prizes at Belfast Spring Show in 1907.

Sale of Shires at Peterborough.

Some capital prices for Shire horses were realised at Messrs. Sexton, Grimwade and Beek's Peterborough repository on Wednesday. Prizes were

HEARSON'S CHAMPION INCUBATORS

During the years 1881 and 1882 Hearsen's Incubators were tested at the University College, Reading, with other hot-water and hot-air machines, the result being that each year Hearsen's Incubators hatched the highest percentage of eggs recorded.

offered in connection with the sale, and induced an excellent entry. In Shire mares four years and upwards the first prize was awarded Mr. H. Jaggars' Wantage Witch by Lockinge Manners, a grand five-year-old bay with a long list of prizes, and she eventually made 150 guineas, Mr. H. Dewhurst, Skipton, being the buyer. The second went to Messrs. W. and J. Thompson's Desford Coquette, an improving four-year-old brown by Desford Combination, for which at the sale Mr. A. H. Clark gave 96 guineas.

Mr. H. Jaggars, of Hundersfield, who is giving up his Norcross Farm, sent eight animals, and for West Wind, a well-grown, good quality colt by Lockinge Manners, there was great competition, the Warwick District Shire Horse Society securing him in the end for 255 guineas. Two five-year-old stallions, Royal President II. and Hixon Harold, went respectively to Mr. C. E. Ivatt, Cambridgeshire, at 70 guineas, and Mr. Maltby, Lincoln, at 44 guineas. The two-year-old filly Lawford Diamond, by Lockinge Forest King, made 140 guineas to Mr. Dunn, King's Newnham; Lawford Ruby reached 120 guineas to Mr. Eschol; Mr. J. Clapperson, Hull, gave 47 guineas for Palterton Queen, another two-year-old; and for the Lockinge Forest King yearling, Emley Matchless, Mr. Whitmore went to 86 guineas; the average of Mr. H. Jaggars' eight lots being 114 guineas.

The late Mr. W. Child's Sister Mary, a two-year-old prize-winning filly, sired by Lockinge Forest King, made 140 guineas, going to Mr. Verburgh, who also gave 96 guineas for a Lockinge Forest King yearling filly, sent by Mr. W. McCreery, of Rugby. Esteem, a two-year-old brown mare, by Gaster Harold, the property of Mr. J. E. Caswell, of Laughton, went to Mr. Grimston, Hull, for 45 guineas; the late Mr. Child's Horninglow Bijou, a two-year-old mare, to Mr. W. Arkell, Fairford, at 50 guineas; and the same breeder's Sister Mary, a Lockinge Forest King yearling, to Mr. Howkins at 130 guineas.

Hunter Sale at Leicester.

Messrs. Warner, Sheppard and Wade had a lengthy catalogue at their sale on the 10th inst., and there was a large and distinguished attendance of buyers. The chief interest centred in the sale of the Hunters which were sent up by the Marchioness of Graham, Mary Duchess of Hamilton, and Mr. J. W. Logan. Surely and Luncheon, from the stud of the last-named at Market Harborough, were sold for 350 guineas and 300 guineas respectively, while four of the Hunters included in the sale by the Duchess of Hamilton aggregated 815 guineas, an average of £213 18s. each. The best of them was Crazy, a seven-year-old bay gelding by Fanatic, and he reached the highest price, 350 guineas. Offers of 170 guineas and 160 guineas for None Other and Lady Wynn were also accepted.

The Marchioness of Graham's Hunters made a higher average, the four aggregating 930 guineas, an average of £234 2s. 6d. each, Grey Tail and Phiz being sold for 280 guineas and 250 guineas respectively, while Bertie changed hands at 220 guineas. The best of Mr. W. Henry Barber's draft was Ruby, a winner in the show ring; he reached 120 guineas, while Mr. E. Holford accepted 145 guineas for the seven-year-old Joyce Faa, and 94 guineas for Bendigo.

Of the cob-hunters which were included in the sale the highest aggregate was received for those sent from the Bicester stud by Mr. J. P. Heywood, Lonsdale; they realised 4604 guineas, Red Knight, 60 guineas, and Mabel, 57 guineas, being the best.

The Registration of Stallions in Devon.

At the last meeting of the Devon County Agricultural Association, Mr. A. Scott Browne presented the report of the committee for the registration of stallions. The examination of stallions was conducted by Professor Pemberton, of the Royal Veterinary College, and forty-seven stallions were passed out of forty-nine. Three were subsequently disqualified, as they were not pure bred. Eleven stallions which were exempt from veterinary examination were also registered, making a total of fifty-five, consisting of thirty-three Shires, fourteen Thoroughbreds, two Hackneys, one Arab, and five ponies.

Thirteen of those who owned stallions last year were no longer represented, but only two complained that they had received no benefit from registration. Thirteen new owners had filled their places. The decrease of five stallions compared with last year was accounted for by the fact that several of the larger owners had reduced their studs. The balance-sheet showed a loss of £13 14s., against £12 last year.

The registration of mares was steadily growing. Two new societies had started registers this year, bringing the number up to twelve, which covered five-sixths of the county.

The committee reminded the council that the liability of the guarantors ceased this year. The scheme was not yet quite self-supporting, the loss

during the last two years having averaged nearly £12. Considering the support the scheme had received, the committee recommended the council to undertake the work themselves, and their report was adopted.

Polo and Riding Pony Society.

Mr. Tresham Gilbey, president, occupied the chair at the meeting of the council of the Polo and Riding Pony Society held on the 8th inst., when twenty-six new members were elected.

The chief subject of discussion was the measurement of Polo ponies, concerning which so much has been written and said, and on the present occasion there was quite a heated debate, at the end of which a resolution was carried referring the matter back to the editing committee to draw up a scheme of centres, at which it was proposed that Mr. Sheather should attend, and that they should then follow out Mr. Miller's suggestion of meeting the executive committee of the Hurlingham Club and seeing whether they would fall into line and come to some workable arrangement by which Mr. Sheather could attend these centres.

PATZAS IN 1907.

Mr. G. Norris Midwood (chairman) reported that the dates of the London Show in 1907 would be March 15 and 16. The schedule of prizes with offers of donations had been carefully considered, and the secretary was instructed to convey their sincere thanks to several gentlemen for contributions to the prize schedule. They further recommended that no limit of entry by the same exhibitor in any other class should be imposed at the forthcoming show. Colts in the young stock classes would have to be entered in the supplement, as they would receive the prize-money. No alterations were recommended in the prizes for young stock, brood mares and stallions, with the one exception that a separate class for Eastern sires was omitted. It was proposed to offer a gold medal for the best stallion or entire colt, and a gold medal for the best mare or filly.

The novice class would be worded as follows:—Ponies, five and six years old, that have never played in a tournament, divided into two sections—light and heavy weight, with prizes of £10, £6, £3, and £2. The committee recommended that the prizes in the classes for light-weight and heavy-weight Polo ponies should be increased—viz., £15, £10, and £5, and that the first-prize winners in these classes at the last three shows should be debared from competition. A silver cup, value £10, given by Mr. Dunbar Kelly, would be offered for the best pony in the show whose sire or dam was entered in the Polo and Riding Pony Stud Book, and which had been reasonably played during any season at any recognised polo club.

The classes for Shetland pony stallions and brood mares were ordered to remain, and two turning races were added to the competitions, involving points going three times up and down the ring, and circling round posts fixed at each end. The measurer and the stewards for the annual dinner were appointed.

The committee recommended that the medals offered under the three schemes—A (brood mares), B (fillies), and C (stallions) should be continued, with an additional scheme—viz., silver medal for the best Polo and Riding pony not exceeding 14 h. 2 in. (confirmed by Hurlingham certificate or that of a qualified veterinary surgeon) the property of a member of the Polo and Riding Pony Society.

MORRAIN AND MOORLAND PONIES.

The results of the transference of the prizes formerly offered at the London Show to the district shows selected by the conveners had more than fulfilled expectations. The sum of money given in prizes and medals, amounting in all to £45, had attracted an entry of 101, whereas the same amount given at the 1905 London Show had only secured the response of seventeen entries. The opinions of the conveners with reference to the allocation of the grant in 1907 had been sought, and their general conclusion was that the scheme had proved most satisfactory and promising, and they recommended that the grant be offered at the following shows in 1907:—Dartmoor—South Brent; Exmoor—Exford, Lynton; Fell—Kirkby Stephen; Highland—Highland and Agricultural; New Forest—Burley; Welsh—North Wales Show at Carnarvon, Welsh National at Aberystwith.

ROYAL SHOW AT LINCOLN.

Sir Gilbert Greenall had reported to the committee that the Royal Agricultural Society had decided to offer classes for polo pony stallions and brood mares. The committee recommended that this society should provide, in addition to two gold medals, the prizes for young stock, viz., Yearlings, two-year-olds and three-year-olds, offering in each case £10, £8, and £5. The report of the Horse Show Committee was adopted.

LONDON SHOWS AFTER 1907.

The society's representatives upon the joint committee presented their report, indicating the offer of the Royal Agricultural Hall Company, and covering the terms that they were prepared to offer for the joint shows after 1907. The council adopted the report of their representatives, and

save the Middleman's profit. Dept. M

gentian, ginger, fenugreek, and black antimony, of each 1½ oz.: powdered capsicum, ½ oz. Mix carefully, store in a covered tin, and give a table spoonful twice a week in damped food.

Horse with Sprained Shoulder.

SIR.—Will you give me advice on following? I have a horse which has been idle this two months with a sprained shoulder. He has been blistered, but is not fit for work yet. I have been advised to rub him with embrocation every day. I should like to know if he gets properly well if he is liable to go lame again with fair work. I have also been advised to put cold water hose on him every day for an hour. Should like to have your advice on him. Sorry to trouble you so much.—FARMER.

Answer: We do not consider answering questions a "trouble," or if there is any trouble, it is when the information on which opinion or advice can be founded is insufficient for the purpose. In your case, for example, we should be in a much better position to give you "advice" if we had more detailed information on certain points. The horse, whose age it would have been an advantage to know, is stated to have "been idle this two months with a sprained shoulder." Unless it has been pronounced by an experienced and qualified veterinary surgeon that the horse is lame in the shoulder from sprain, we should like some better evidence of it than the bold assertion, because our experience has taught us that the majority of horses said, often with confidence, to be lame in the shoulder, turn out to be lame in the foot. Then we should like to know what part of the shoulder is sprained, assuming that your diagnosis is correct, how it happened, and in what work the horse was engaged when it was observed to fall lame, and whether or no at the time of writing the muscles of the shoulder are normal in appearance, or whether the *antæa* and *postæa spinatus* muscles are wasted, and show outline of the process of the shoulder-blade. A great deal as regards future treatment and prospects of success depends on these points, and only on a fair acquaintance with them is prognosis possible.—That is, we must know something about them before we can attempt to form any opinion on the question "if he gets properly well, will he be liable to go lame again with fair work?" If the case is one of atrophy or wasted shoulder, and the horse is a young animal that fell lame after being worked in the plough, it will probably become sound, and remain sound, if you do not work it in the plough again. In writing again, if you care to do so, giving the details asked for, kindly refer to this reply. If you are not quite confident as to the shoulder being the seat of lameness, it would be wise to get the animal examined by an experienced veterinary surgeon.

Lincolnshire Red Shorthorn Society.

At the recent meeting of the Lincolnshire Red Shorthorn Association it was decided to offer the following prizes at the association's bull sale in April next:—For bulls, calved between March 1, 1905, and March 1, 1906, prizes of £5, £3, £2, and £1, and for bulls calved on or after March 1, 1906, prizes of similar value. It was further resolved that the entries be limited to two animals from any one exhibitor in any class, and that the vendor be required to sign a certificate that an animal winning a prize must be actually sold at the sale.

Several applications for admission to membership were received, and arrangements made for the inspection of the herds.

Lincoln Longwool Sheep Breeders' Association.

A meeting of the council of this association was held at the Lincolnshire Agricultural Society's Council Room, Lincoln, on Friday week.

Applications for admission to membership were considered and arrangements made for the inspection of the respective flocks.

It was suggested that as a sale of pedigree stock is held in connection with the Royal Show, the association might abandon their first sale of rams and take advantage of the opportunity to enter their stock at the sale at the Royal Agricultural Show, and enlarge their September sale to two days (September 5 and 6) if found necessary; members to be allowed to sell gimmers on the second day at the close of the sale of rams.

At Manchester on Wednesday, Messrs. Lonsdale and Thompson, produce sellers, of that city, were summoned at the instance of the Irish Agricultural Department for applying a false description to boxes of eggs. The manner in which the cases were marked suggested that the eggs came from Ireland, whereas they did not. The defendants were fined 40s. and costs on one summons, with 2) guineas extra costs.

Scottish Shorthorn and Aberdeen-Angus Sales.

The industry of cattle breeding in Scotland as represented by the combined interests of the Shorthorn and Aberdeen-Angus breeds is, says the *Banffshire Journal*, at present in a flourishing condition. In marked contrast to the conditions which have prevailed throughout the entire year in the meat markets where the ordinary commercial cattle of the country have their values gauged, the pure cattle trade has been of a most buoyant nature, 2,228 animals of the two breeds mentioned selling at an average of £42 1s. 2d. at the various public sales held in the course of the year. The annals of Scottish live stock breeding present no parallel to this result. Reckoning from 1884, the nearest approach to that figure was made in 1904, when, added largely by the dispersion of the Uppermill Shorthorn herd, an average was reached on the year's transactions of £34 17s. 2d. The all-powerful factor has been the extensive demand that has been experienced from Argentina, and in this connection it is not unnatural to recall that last year for the first time that country sent us a greater quantity of meat than did our former leading sender, the United States.

As showing the extent of the South American trade it may be stated that in the first three months of the year, which is the most active time in cattle exportation circles, there were despatched no fewer than 800 animals. The great bulk of the cattle were, of course, acquired privately in view of the risks of the tuberculin test, but it is significant both of the keen demand and of the healthy conditions of British stock, that the year saw so many animals purchased for the country of the Plate by competition at the public sales. As compared with last year, when 2,621 animals were sold at the public auctions in Scotland, the average shows an increase of £10 1s. 2d., while the gross drawings at the sales for cattle of these two breeds rose from £53,874 12s. 6d. last year to £93,763 11s. 8d.—a remarkable overturn for a year's public output of this branch of Scotland's leading industry. As has been the case for the past few years the greater value as between the two breeds has lain with the Shorthorns, of which 1,066 have been sold at an average of £63 10s. 5d., as against £43 0s. 5d. last year, and £51 15s. 1d. in 1904, which was the previous highest range of prices over a series of a quarter of a century.

The year has not dealt so kindly with Aberdeen-Angus interests, though a re-commencement of the trade to Argentina reached no mean dimensions, and gives every promise of development. In some quarters a disconsolate note is being uttered, but matters are not so bad as that, and, moreover, it is well known from past history that tastes change, and that different breeds of stock are favoured with cycles of public patronage. It is the day of the Scotch Shorthorn at present; it may be the day of the Aberdeen-Angus next. In any case breeders of the variety are buoyant as to the future. The breed has in the past overcome too many obstacles and gained too high a place in competitive achievement for its patrons to become down-hearted. Though Shorthorn averages are for the present going up, it must be kept in mind that Aberdeen-Angus values are not going down in the same ratio. An average of over £22 for 1,162 cattle in a year which has seen no very important sale of the breed in Scotland is not so very hopeless, and Aberdeen-Angus men can also look back to their fat years—the early eighties with their averages of over £50.

A summary of the total year's business in pure-bred cattle in Scotland may be conveniently stated in the following table, in which, in addition, a comparison is instituted with former years' prices.

Year.	No. sold.	Average.
1896.....	2,196	£24 17 9
1897.....	2,021	25 12 7
1898.....	2,332	24 12 8
1899.....	2,189	30 1 1
1900.....	2,083	27 0 9
1901.....	2,361	26 15 8
1902.....	2,738	27 15 0
1903.....	2,490	28 17 10
1904.....	2,540	34 17 0
1905.....	2,291	32 0 0
1906.....	2,228	42 1 2

Shorthorn Society.

Twenty-two new members were elected at the last meeting of the council of the Shorthorn Society.

At the same meeting Lord Moreton reported that the Editing Committee had examined the list of pedigree exportation certificates issued by the secretary since the last meeting of the committee—viz., for Africa 4, Australia 7, Canada 8, Germany 5, Japan 1, New Zealand 5, Portugal 5, South America 373, Spain 1; total, 499. This brought up the number of certificates issued during the present year to 2,400. The committee recommended the registration of the name "Blaisdon" by Mr. Colin Melver. This report was adopted.

It was reported by Sir Nigel Kingscote that the suggestion made by Mr. John Thornton at the last general meeting, and referred to the General Purposes Committee by the council—viz., that the R.A.S.E. be asked to make a division in the young bull class, dividing it into one class for bulls born January 1 to March 1, and another class for bulls born March 1 to the end of the year, the Shorthorn Society contributing the increased prize-money, and if the society could afford it, extra prizes for heifers, had been considered by the committee, and they recommended the following division of the two classes at the R.A.S.E. Show, in which there was such a large number of entries at the last show:—

Classes for bulls calved on or between January 1, 1905, and June 30, 1905; July 1, 1905, and December 31, 1905; January 1, 1906, and June 30, 1906; July 1, 1906, and December 31, 1906; the Shorthorn Society to give the extra prizes in the two new classes. The committee did not recommend the sub-division of the heifer classes. The committee also recommended the institution of a group class consisting of a bull and two, three, or four of his male offspring bred by the exhibitor, not less than six months old on the day of entry, with a first prize of £20 and a second of £10. The committee also recommended the offer of the prizes for heifer class born in 1904, and that the champion prizes be of the value of £30 each instead of £50 as last year.

The full scheme of prizes for the year 1907 will be considered at the next meeting of the committee.

This report was adopted.

The next meeting of the council was fixed for December 11, 1906.

Canadian Cattle Importation.

Its Effect on Irish Farming.

Some important evidence on the effect on Irish farming by the removal of the existing restrictions on the importation of store cattle into Great Britain was given in London before the Royal Commission on Congested Districts in Ireland by Mr. W. F. Bailey, one of the Estates Commission. He had, he said, communicated with about fifty people acquainted with all parts of Ireland, and asked for their views on this subject, and what in their opinion, the results would be as regarded the various classes of farmers in Ireland, and in what way the security for the advance made under the Land Purchase Acts would be effected. These queries were addressed mainly to the Assistant Land Commissioners, assessors, inspectors, and valuers engaged in settling fair rents under the Irish Land Act, and in estimating security under the Land Purchase Acts. Important information was also obtained from leading cattle salesmen. It was evident that the free importation of stores would affect the various classes of farmers and land holders in different ways. Summarising the replies to his queries, he found that there was an almost unanimous opinion that the removal of the restrictions would have a disastrous effect on small farmers mainly in the South and West of Ireland, who carried on a system of mixed tillage and pasturage. One writer was of opinion that a loss of 30 per cent. would fall on the gross amount from the sales of stores.

Another estimated that a reduction of 27½ per cent. off the existing rents would be necessary as a result. A third—these writers were all from Ulster—thought that the removal of the restrictions would lead to a general inability to pay the land purchase annuities; while a fourth, from the Province of Munster, thought that there would be a general loss to this class of 25 per cent., and that the inferior stores of the poorer rent would be almost unsaleable. It was evident that this class of Irish farmers would suffer severely at first from such a change in values and in prices as would result from the competition due to the free admission of foreign stores. Their capacity to pay rent or annuities under the Purchase Acts would be seriously impaired, but after a time it was probable that their condition and that of the country generally would be improved. More attention would be paid to tillage farming, and small farmers would consume at home a larger proportion of the produce of their land.

The general opinion was that the reduction in the price of young stock, which would follow the

opening of the ports, would seriously affect the large dairy farmers, who to a considerable extent depended on the profits from the sale of their calves to make their rent or annuities. A large Munster dairy farmer stated that the decline in the value of his young stock would reduce his profits by at least 20 per cent. Another correspondent from the same Province, with considerable experience of this class of farming, estimated the loss as fully 25 per cent. of his net profits. On the other hand, an Ulster agriculturist was of opinion that those dairy farmers who bought heifers for milk purposes and did not rear calves would benefit from the lower price of stock. The large majority of correspondents, however, were strongly of opinion that this class of farmer would suffer seriously from the lower prices that would be obtained from the sale of their calves owing to the unrestricted competition.

In regard to graziers who occupy store cattle lands, mainly in Connaught, opinion was almost agreed that this class would be injuriously affected by free importation of stores. It might be accepted that the reduction in the price of stores consequent on free competition would eventually bring down the price of young stock reared in Ireland, although perhaps not to a proportionate extent. The lower price which the grazier would receive for the stores he sold would not be compensated for by a corresponding fall in the price he paid for them. This class of grazier had suffered severely of late years from the fact that the prices obtainable for their stores was low in proportion to that at which they were purchased. Free competition would certainly accentuate this disproportion. There was an almost unanimous opinion that large graziers who occupy fattening lands, mainly in Leinster, would largely benefit by the free importation of stores. They now sought in a protected market, and had to sell in a practically open market. Graziers of this class could hardly be regarded as farmers at all. They frequently did not live on the lands they worked, and they gave very little employment.

The general effect of the free admission of store cattle into the British Isles would be to reduce the price of young cattle, and consequently the profits of dairy farmers who breed and of sellers of stores generally, while it would benefit graziers who bought to fatten. It had often been noticed that there was a great discrepancy between the relative prices of stores and of beef—that the price of stores measured by weight was proportionately much higher than of the finished animal. This had puzzled many people, and it seemed contrary to the economic law that the price of the ultimate product must be in relation to the price of the raw material on which it depended. The explanation was that store cattle were in fact protected in Great Britain by the prohibition on importation, while the fat cattle were subject to the competition of the world, restricted only by the necessity of slaughtering imported animals at the port of entry. Were it not for this circumstance the price of beef and of fat cattle would inevitably rise in proportion to the price of stores. Foreign competition prevented this, and, of course, heavily handicapped the British fatterer, who had to buy his stores dear and sell his finished animals cheap.

Questioned by Sir John Colomb as to whether it was fair to make the deduction that the Scottish buyer would give for Irish stores than the Irish grazier, witness said the modern tendency was that Scottish buyers who came across the water to fill up their wants would give more for the store cattle to the small tenant than the Irish grazier. The Scottish buyers must get the cattle. Owing to the ports being closed there was no competition, and the Irish seller of stores had practically his own way.

Transactions in Store Stock.

(Reported to the Department of Agriculture and Technical Instruction for Ireland.)

Drogheda Fair, co. Louth, held on November 14. Large fair; plenty of shippers attended and demand moderate, nearly all the cattle being sold. Yearlings, 1st class, £8 to £9; 2nd class, £7 to £7 5s.; two years old, 1st class, £11 5s. to £12 10s.; 2nd class, £9 to £11; three years old, 1st class, £13 5s. to £15 2s. 6d.; 2nd class, £11 to £13; springers, 1st class, £16 5s. to £19 15s.; 2nd class, £13 15s. to £15. Young pigs, eight to ten weeks, were in slow demand at from 18s. to 25s. each.

Newbridge Fair, co. Kildare, held on November 13. Rather large fair; brisk demand for two and a half and three years old cattle in condition, but younger and thinner cattle hard to sell. Yearlings, 1st class, £8 12s. 6d. to £9 10s.; 2nd class, £6 to £6 10s.; two years old, 1st class, £10 10s. to £14 12s. 6d.; 2nd class, £8 5s. to £9 15s.; 3rd class, £6 10s. to £7 5s. 6d.; three years old, 1st class, £15; 2nd class, £14; springers, £15 12s. 6d.

Notes and Jottings.

THE autumn has certainly done its best to make up the deficiencies in food supply occasioned by the summer drought, and crops which at one time were looked upon as failures now cover the ground and rapidly increase in weight. The prospect for keep during winter is thus vastly improved. The spring food supply, which looked at one time to be in a precarious position, has now become assured, for despite the lateness of sowing occasioned by want of rain, the autumn sown catch crops have become well established. Such a change when things looked so bad when autumn had commenced is most unusual, and, therefore, all the more welcome.

A FEATURE of the season is the succulence of the food at such a late period, and there is as much risk of sheep becoming hoven or blown as there is ordinarily a month earlier in the year. Many cases of hoven have occurred, and whilst the mild weather continues there is likelihood of their continuing. In such weather, too, swedes grow rapidly, but do not mature despite their size, and are not therefore wholesome food. It is, therefore, desirable to keep away from the crop as long as possible, or if the exigencies of the food supply demand that they must be eaten at once, there is more than ordinary necessity to be liberal with the dry food.

CABBAGES demonstrate their value at this season when they are well matured and very feeding; and whilst sheep are scouring on swedes and doing very little good, those on cabbages thrive well. In dirty weather such as is being experienced in the sheep pens, the advantage of the cabbage which stands well above ground, over the roots which grow in the ground and are soon smothered, when sheep gnaw them is very marked; there is great waste of root even though the heels are picked up. Nor is the extra dirt the sheep are obliged to consume good for them.

TAKING all the expenses of the two crops, swedes and cabbages, when the two crops are fed to sheep, cabbages are certainly the least expensive to grow if the swedes are got up, topped, tilled, and cleaned, and sliced in a turnip cutter. If they are not got up and sliced, it is only in the most favourable times when there is not considerable waste. For my own part, I have never been able to see much difference in the cost of growing the two crops; and cabbages which can be cleaned up without having to be got up and sliced are certainly the more economical, as well as the safest autumn food.

IN these days the humanitarian is very much alive, and his methods are frequently irksome to others in relation to matters in which, were he to get his desire, he would gain little for the animals in whose cause he has interested himself. In other words, he is inclined to be busy in matters that do not call for interference. There is one matter in connection with sheep farming where much avoidable suffering occurs, which might be avoided with distinct pecuniary advantage to the owner. Those who have seen sheep racked and shaken with husk until they are living skeletons, and of which some soon become dead ones, cannot fail to see how unprofitable it is to allow sheep to get into this condition. Yet there are districts where thousands of sheep may be seen during a day's drive where the majority are suffering intensely, and practically nothing is done to relieve the sheep.

IN rare districts husk is little known, as it is mainly derived from pastures which harbour the husk worm which causes the husky cough. As a rule the lower-lying pastures are most infested by husk worms, though damp ones on higher ground are bad, as dampness is a condition which specially favours their development; while any pastures frequently carrying sheep are liable to be dangerous. Husk is therefore a very prevalent ailment, and the annual loss of money caused by it must represent an enormous sum among the 30,000,000 sheep in Britain.

HUSK is avoidable, it is the source of great loss, and causes an amount of suffering among sheep. It is, however, not strictly a contagious ailment, though where the husk worm is prevalent it may attack a whole flock; but the fact of its

being so common appears to have made many absolutely callous of the suffering, and careless of the loss. If there is one matter on the farm in which curative methods should be insisted upon, it is that of husk. By this one does not mean that whenever a sheep sneezes or coughs compulsory measures should be taken to cure it; but when sheep are really bad with husk those who do not try to alleviate the suffering should be forced to do it. We all know what irritation any small substance in the breathing tubes causes us; but what should we think if we were in the position of the sheep, with a considerable number of worms attacking the throat, causing inflammation, which the hardest and most continuous coughing will not dislodge?

THE associated condition to which sheep are brought is undeniable evidence of the sufferings the sheep undergo; and it does not need to be much of a humanitarian for one to think that if the owner, of his freewill, does not take steps to remove the cause, someone ought to make him. The owner could have no cause to grumble, as the difference in the value of a sheep after husking through autumn and winter would be represented in shillings for every penny that need be spent in the cure. Of course a very great many do systematically keep it in subjection.

THE old question of colouring sheep has come to the fore again; and the National Sheep Breeders' Association was very wise in recommending that each breed should advise as to what degree of colouring should be permitted when sheep were being exhibited. The limitation, we have always urged, is that colouring be permissible so far as it improves the uniform appearance of the animals without covering up blemishes, and that it should be confined strictly to the fleece.

THE practice of colouring, which has been common for more than a century, must be regarded as improving the appearance of the sheep in some breeds, or it would not have been so general; this is only smart marketing or exhibiting. When used to disguise black spots in the skin, spots on the face, or when there should be none, or any feature that is not consonant with the breed features, then fraudulent faking is intended, and the sheep should be disqualified.

Scottish Farmers and the Sheep Dipping Orders.

ON account of the excessively wet weather lately experienced, sheep farmers have in a great many cases found it impracticable to have the autumn dippings of their sheep carried through within the time specified in the Sheep Dipping Orders. At the meeting of the directors of the Highland and Agricultural Society on the 7th inst., it was resolved to bring this state of matters under the notice of the Board of Agriculture and ask for an extension of the dipping period to the end of November.

In response to these representations the Board of Agriculture have sent a letter in which it is pointed out that local authorities are empowered by Article 3 (2) (1) of the Order, to grant an exemption from dipping requirements thereof in respect of any sheep in connection with which special circumstances render it impracticable to dip them by the 12th inst., and those authorities also have power to make it a condition of the exemption that the sheep should be dipped within a fixed period after that date. The Board have already been in communication on this subject with several of the local authorities concerned, and they believe that the local authorities are prepared to exercise their powers freely in this respect in all cases in which the required dipping has not been carried out by the 12th inst., in consequence of the exceptional character of the weather now prevailing.

The Board consider desirable that application for an exemption should be considered individually, in the manner indicated above, rather than that the Board should make an extension of the dipping period of general application by amending the Order, as suggested by the Highland Society, inasmuch as any such general extension would have to be accompanied by a provision continuing in operation for a like period the restrictions imposed by Article 15 of the Order, as amended by Order No. 7048, on the exposure of sheep at markets in the area and on the movement of sheep out of the area.

At a recent meeting of the Cheshire County Council the chairman of the Main Roads Committee declared that a stretch of the main road from Manchester to Chester in the Knutsford district had been seriously damaged by dust-laying experiments. When wet weather came and broke up and became perfectly rotten. The county surveyor estimated that it would cost about £600 to re-make the road.

Live Stock Record.

DIRECTORY OF BRITISH PEDIGREE STOCK OWNERS.

* * The charge for Advertisements (if set in small type) under classified heading in this section is one penny per word each insertion.

HORSES.

SHIRES.

BLAGDON SHIRE HORSE STUD. (Established 1879). Proprietor, CLEMENT KEEVIL Billington, Leighton Buzzard, Beds. (late of Blagdon, Malden, Surrey). High-class animals for sale of all ages and both sexes; also massive sound Stallions to let for the season.

CATHORPE SHIRE STUD, the Property of J. P. Cross, Esq., Cathorpe Towers, Rugby. — There is always a choice selection of SHIRE STALLIONS, MARES and FILLIES, as well as a large Herd of PEDIGREE SHORTHORNS of deep milking propensities, and a uniform flock of OXFORD DOWN SHEEP. — Apply, Mr. F. CAMPBELL, Estate Office, Cathorpe, Rugby. Telegrams: "Campbell, Cathorpe."

CROSS, J. L., Cathorpe Towers, Rugby. Shire Stallions, Mares, &c. Also Red Shorthorn Bulls from milking strains, and Oxford Down Sheep. — Apply F. CAMPBELL, Cathorpe, Rugby.

JOHNSON, WALTER, Hatfield, Doncaster. Stud Horse, Lambton King 16757. Stallions for hire. Weighly young Stallions, Mares and Fillies on Sale.

MUNTZ, Sir P. ALBERT, M.P., Dunsmore, Rugby. SHIRE-DRIPPS, STALLIONS, COLTS, MARES and FILLIES. About a hundred of all ages. Prize-winners London and other leading shows. Also high-class Shropshire SHIRE, winners first prize at Royal Agricultural, 1886, second in 1887, and first in 1888. — Apply THOMAS EWART, Dunsmore.

NOTTINGHAM CORPORATION, Stoke Farm. — Shire Stallions, Mares, Fillies, and Geldings of fashionable breeding, including prize-winners on sale. Inspection invited. Visitors met. — Address A. AVIS, Stoke Bardolph, Nottingham.

THE RIGHT HON. LORD ROTHSCHILD, Tring Park, Tring. Breeder of Shire Horses; Jersey, Red-polled and Shorthorn Cattle, and Hampshire Down Sheep. — For any further particulars, &c., please apply to Mr. RICHARDSON CARR, Estate Office, Tring.

HUNTERS.

ROBINSON, ERNEST W., Brookleigh, Esher. Irish-bred 1, 2, 3, and 4-year-olds, brood mares, made and unmade Hunters for sale.

HACKNEYS, &c.

CONCHAR, JOHN, Wyde Green, Birmingham. Breeder of High-class HACKNEYS. Several have been successful in the showyard. Colts and Fillies by the leading Stallions of the day.

MOORE, HENRY, Burn Butts, Cranswick, Hull. Pedigree Stud of HACKNEYS, including many prize-winners, yearlings, two years, and others. — Can be seen on application to Henry Moore.

CLYDESDALES.

CLYDESDALES. — The Seaham Stud Co. have Mares, Fillies, and Colts of the choicest breeding always on Sale. — Apply, R. BRYDON, Seaham Harbour, County Durham.

PONIES.

MILLER, W. S., Forest Lodge, Brecon, South Wales. Extensive Breeder and Exporter of best class of Welsh Mountain Ponies and Cobs

CATTLE.

SHORTHORNS.

COWLEY MANOR SHORTHORN HERD, property of James Horlick, Esq. Bulls and Heifers of choicest breeding. Crickchank and Bates blood, successful in dairy and showyard. — Apply, W. HITCH, Estate Office, Cowley, near Cheltenham.

DENNY, F. A. & E. H. M., Bore Place, Chiddington, Eden Bridge, Kent. A carefully-selected herd of choice Shorthorns. — Stud Bulls, Ascot Constellation by Silver Mist 79068; Primrose Pate 79065. Young Bulls for sale. — Apply, G. MACLEAN DAVIDSON, as above. Telegrams, Bore Place, Bough Beech Railway Station, Penhurst.

WORTHINGTON, Duffcarrig, Gorey, Co. Wexford, Ireland. Pedigree Dairy Shorthorns (Crickchank and Scotch strains). Successful in dairy and showyard. Young Bulls and in-calf Heifers of good colour for sale. Exportation orders executed.

SHORTHORNS. — COWS of the Seraphina, Julia, and Old Fairy families. Young BULLS and HEIFERS, sired by Blood Royal, a Bull shown with great success last season, and recently sold for exportation. — J. R. WILKINS, The Grove, Longton, Lancs.

CATTLE—continued.

HEREFORDS.

JACKSON, R. NEWTON, Blackbrooke, Pontarilas, Herefordshire. Pure-bred Hereford Cattle, with pedigrees dating back to very early volumes of Herd Book. Bulls and Heifers for sale at reasonable prices. Shire Horses and Shropshire Sheep.

DEVONS.

BOWERMAN, Alfred, Capton Williton, Taunton. Breeder of Pedigree Devon Cattle. A specialty for large size, with quality and robust constitutions; colour dark red. Sent to all parts of the world. Prices moderate.

SOUTH DEVONS.

ROWE, F. W., Trevego, Lostwithiel, Cornwall. Breeder of pure-bred South Devon Cattle of best and pure strains of blood. Bulls, Cows and Heifers for inspection and sale.

ABERDEEN-ANGUS.

SWAYLANDS ABERDEEN-ANGUS HERD. The Property of Mr. George Drummond. Stock always on sale. — Stud Bull, Ebouiser 21782, Winner of 3 Firsts and 2 Champions 1905. — Apply, W. E. ROGERS, Bowens, Fenshurst, Kent.

For Sale.
PRIZE BRED POLLED ANGUS
COWS, BULLS, and HEIFERS.
Finest Strains. Inspection Invited.
GEORGE HOYLES,
Skidby Manor, near Hull.

RED POLLS.

CRANWORTH, Rt. Hon. Lord, offers reasonably, from his prize-winning herd of Red Polls, Bulls, Cows, Heifers, from good milkers. — Apply, C. F. STEBBING, Letton, Thetford.

JERSEYS & GUERNSEYS.

SEVERAL JERSEY BULLS of this year for SALE; good looking and of the best strains. — Apply J. H. SMITH-BARRY, Esq., or HERDSMAN, Stowell Park, Pewsey, Wilts.

TUCHBORNE PARK GUERNSEYS, property of Sir H. D. Titchborne, Bart. Bulls, Cows and Heifers of very best breeding for sale. — D. MICHIE, Titchborne Estate Office, Alresford, Hants.

MERTON GRANGE GUERNSEYS. — Property of Frank Hargreaves, Esq. This Herd contains Champion Bull Royal Counties, Portsmouth, and Champion Cow Royal Derby, 1906. Bulls, Cows and Heifers of best Breeding for Sale. — Telegrams and particulars, W. J. EMERSON, Merton, Gillingham.

KERRIES.

CORY, CLIFFORD JOHN, M.P., Llantarnam Abbey, Monmouthshire. Pedigree Kerries. Championship and other prize-winners, Royal and other Shows. Llantarnam Station, G.W.R.

SHEEP.

LINCOLN LONGWOOL.

DUDDING, HENRY, Riby Grove, Gt. Grimsby, Lincolnshire, has always for inspection and sale a large flock of pure LINCOLN LONGWOOL SHEEP, including many prize-winners, having taken the leading prizes for many years at the Royal and other shows for both rams and ewes, including champion medals at both the Paris Exhibitions, Vienna, Amsterdam, Canada, Australia, New Zealand, and all the leading prizes at Chicago; also the first for the best collection of Lincoln fleeces of wool at the Royal Windsor Show, which proves the character of this flock, which is most famous for their great size and 125 years' good breeding. Rams from this flock made the highest average on record last year. Riby Grove is seven miles from Great Grimsby, and 3 from Stallingborough Station. Telegrams, "Dudding, Keelby."

For Sale.
SKIDBY MANOR FLOCK,
Shearling Rams.
PURE LINCOLN LONG WOOL.
Fine Lustrous Wool. Even Fleeces. Strong Constitution. Suitable for Export.
Inspection Invited.
G. HOYLES, Skidby Manor, near Hull.

SHEEP—continued.

HAMPSHIRE DOWNS.

COLES, Cary, Manor House, Winterbourne Stoke, Salisbury. Registered HAMPSHIRE DOWNS. Prize-winners Royal, leading English and foreign shows, Salisbury Fair, 1900, 1901, 1902, 1903 and 1906, 25gs. challenge cup. Chicago, 1901, all Champions and firsts for rams and ram lambs. St. Louis Exhibition, 1904, 10 sheep exhibited—all won class prizes, besides grand champions, reserve grand and champions. Annual ram sale August, 1906. — Extraordinary records: Twin ram lambs let for 25 and 120 guineas. Ninety averaged £21 10s. Selections always for Sale.

REGISTERED HAMPSHIRE DOWNS. — F. FLOWER, JAMES, Chilmark, Salisbury. Leading Flock in Prize Records, Champions at home and abroad. Since 1894, "The Salisbury Fair Challenge Cup" (the Blue Ribbon of Show Yard Contests). Won eight times; twice second, out of ten Competing. THE Melton Constable celebrated Herd of Pedigree Tamworth Pigs. Prize winners at Norfolk, Suffolk, and other shows. Champion Cups Smithfield. Several recently exported for Continental and Colonial herds.—Apply R. OWEN GODDARD, Estate Office, Melton Constable, Norfolk.

SOCIETIES.

Smithfield Club.

The chief item of interest at the last meeting of the council of the Smithfield Club was the discussion which took place on a letter received from the Polled Cattle Society with reference to the rules applying to the entry of the Aberdeen-Angus cattle at the club's shows. That society was wishful that the club should not permit the entry of an animal in the Aberdeen-Angus classes unless such animal is entered or eligible for entry in the Polled Herd Book, or unless such animal shows four continuous crosses of Aberdeen-Angus blood (registered sires) in the pedigree.

It had been previously pointed out to the Polled Cattle Society that the club's rules do not require that animals entered as of any particular breed should be eligible for the Herd Book of such breed.

There were in all breeds cattle which were technically ineligible for entry in the Herd Book of the breed, but which were pure-bred cattle, and these, if not allowed to compete in the breed classes, could not be exhibited, as they would not be eligible as cross-breeds, no cross being known, and under the club's rules animals were not considered to be cross-breeds if they had more than three consecutive crosses of the same blood.

Mr. J. J. Criddle said he had been specially requested to support the application of the Polled Cattle Society and, which he hoped would be favourably considered. It was questioned which did not affect the Aberdeen-Angus cattle only, it affected all breeds of cattle. It was true this was not a breeding society, but it was certainly desirable that animals of doubtful breeding should not appear in the breed classes. He had two Aberdeen-Angus cows which he purchased in the north, but owing to the sudden death of the breeder they could not be identified, and consequently the Polled Cattle Society would not register their progeny. The cows had bred regularly and their produce he had successfully exhibited at the club's shows, but he was quite prepared to sacrifice these animals if the club agreed to the proposal of the Polled Cattle Society.

Mr. Richard Stratton said the question raised by the Polled Cattle Society suggested alterations in the rules which affected all breeds of cattle. The club was not a breed society, and they wanted to open their net as wide as possible, and so long as they got animals certified by the breeder to be of the breed, and of the character of the breed in the opinion of the judges, they should not alter them. If they were not as described they were always subject to disqualification. The existing rules had worked satisfactorily for so long that he could not see any necessity for the suggested alterations.

Mr. W. Reid said he thoroughly supported the remarks made by Mr. Stratton. He was sure it was not desirable to narrow the club's sphere, and he could not see any reason for change. His friend Mr. Criddle had shown in his own case the desirability of continuing the present rates and conditions.

The Earl of Coventry, who presided, said it appeared to be the general opinion of the council that the Polled Cattle Society had not made out a sufficiently strong case, and he therefore moved that the secretary be directed to inform that society that the council were unable to accede to their request for an alteration in the present rules of entry, and this was agreed to.

At the same meeting Mr. F. Orford L. Walpole who had for the last fourteen years assisted the late Professor Sir George Brown as resident veterinary inspector at the club's show, was appointed veterinary inspector for the forthcoming show, whilst a letter was read from the Railway Clearing House stating that the club's application for reduced fares for members visiting the club's show had been submitted to the railway superintendents in conference, who regretted that they were unable to accede to the application.

Forty-eight new members were elected, and the next meeting of the council was fixed for December 11.

Royal Lancashire Society.

The Royal Lancashire Agricultural Society is to be congratulated on the success which attended their own contracting and catering at their Lancaster show this year. The results were made known at the quarterly meeting of the council, held on Wednesday at Liverpool, and gave general satisfaction.

Mr. Windham E. Hale, in moving the adoption of the Works Committee's report, stated that the Lancaster in August had been completed, and the ground had been handed over to those who lent it, to the satisfaction of the latter in every way. The committee had also taken possession of the ground at Bolton (the place for next year's show), and the work for the coming year's show was well in hand.

The total cost of the Lancaster show had amounted to £1,783, as against £2,180 at Liverpool in 1905. If the showground at Lancaster had been erected, as in the past, by a contractor the total cost to the society would have been some £3,000, so that in doing this work themselves the society had been saved something like £1,200. Another advantage of this policy was that they avoided any of the difficulty which had been experienced the last time they visited Bolton, in connection with the trade unions; on this occasion the trade unions had met the secretary, and were ready to support the show in every way.—The report was adopted.

Mr. James Kay reported the results of the catering, which had at Lancaster been undertaken by the society for the first time in their history. The committee had successfully carried out their instructions to supply a better article both of food and drink at a less price than had previously been charged by contractors. They supplied no fewer than 8,328 luncheons at 1s. per head less than contractors' price, a saving of £416 to the public; 10,025 teas at a saving to the public of £250, while liquors of a very considerably better quality were provided at a very substantially reduced price. Sandwiches to the number of 19,363 were made and sold on the ground, and 10,000 pork pies were also disposed of. A staff of 283 had been engaged.

He had no hesitation in saying, added Mr. Kay, that the saving to the public at the Lancaster show in the catering department was not less than £1,000. In addition to a saving of £100 to the council, the committee had made a gross profit of £529, and after debiting themselves with £150, which they thought they would have got from a contractor for the right of catering at Lancaster, they had a net balance of £379 to hand over to the council.

The report was adopted with general congratulations on the success of the committee's efforts, and a resolution to retain the catering in the society's hands was unanimously carried.

The secretary (Mr. Edward Bohane) announced that the total receipts from all sources in connection with the Lancaster show had amounted to £9,671, and after meeting all expenses there was a balance of profit of £69. In the history of the society they had never previously gone north of Preston under a loss of £1,000, while at Barrow-in-Furness they had lost £2,000. There had been a saving effected of £1,000 in the fitting up of the ground at Lancaster and of about £500 in the catering.

It was decided to sign a petition from the Federation of Lancashire Agricultural Societies in favour of railway companies being asked to grant reduced fares to officials and exhibitors travelling on the various railways in connection with agricultural shows.

It was further decided that the 1907 show at Bolton should be held on August 1, 2, 3, and 5 (Bank Holiday).

Highland Society.

At the last meeting of the directors of the Highland and Agricultural Society of Scotland, the secretary read a letter from Sir James Gibson-Craig, Bart., who was president of the society, the Duke of Buccleuch, had permitted him to announce that their Royal Highnesses the Prince and Princess of Wales would go to Dalkeith and would attend the show in Edinburgh if the date could be fixed for the second week of July, 1907. Sir James suggested that the dates July 9, 10, 11, and 12 should be adopted.

The dates mentioned were accordingly agreed to. It was announced by the secretary that the accounts of the Peebles Show, subject to audit, showed a balance on the right side of £340. The Chairman (Mr. A. Gordon of Newson) regarded that result as very satisfactory in the circumstances, and it was pointed out that the park had been improved from the point of view of pasture by the holding of the show there.

As the Edinburgh Agricultural Association will not hold their show next year, it was agreed to grant permission to have that association's usual "Derby" sweepstake for Clydesdale yearling colts and fillies carried out in the Highland Show at Edinburgh.

With regard to the Aberdeen Show of 1908, it was stated that the town council of Aberdeen had resolved to give a donation of £100 towards the local fund, and to grant the use of the links for the showyard, while the county council of Aberdeenshire had resolved to raise £500 by a voluntary assessment.

Mr. Marr, Uppermill, moved that the directors adhere to the resolution prohibiting exhibitors from leading their own stock in the judging ring in certain classes. He did not think it a right thing for exhibitors to go into the ring. No doubt their judges were quite independent, but the presence of an exhibitor in the ring was an embarrassment to the judges which the society should not permit.

The motion was not seconded, whilst Captain Clayhills Henderson moved that the resolution be rescinded, and this was adopted.

The Federation of Lancashire Agricultural Societies.

At the quarterly conference of the Federation of Lancashire Agricultural Societies, held at Blackburn on the 10th inst., Mr. J. W. Parkinson, of Worsley, presiding, it was reported that the following dates of shows for next year had been arranged:—Padham, August 3; Norden, July 27; Burnley, May 18; Rochdale, August 19; Ashton-under-Lyne, June 15; Whitworth, August 10; Cliviger, August 19; Wardsley, September 11; Delph, April 27; Colne, June 1; Darwen, May 11; Great Harwood, May 21; Newchurch, May 27; Ramsbottom, June 8; Scarsbrick, Halsall, and Downholland (a new society), July 24; Worsley, August 31; Worsworth, May 14; and Hebden Bridge, May 25.

The secretary submitted a tabulated statement showing the average receipts of the various affiliated societies for their shows of 1903, 1904, and 1905, and the premiums which would be required to pay compensation under schemes of insurance based upon gate results. Scheme No. 1 requires a premium of 15 per cent. to pay full compensation in every case where the gate of 1906 falls below the average of three years, and this leaves a balance of £6 6s. only. Scheme No. 2 allows a compensation to be payable only in those cases where the gate receipts of 1906 fall more than 25 per cent. below the average, and shows a surplus of £33 6s. 3d. The latter scheme is based on a premium of 5 per cent., and benefits only those societies sustaining heavy losses. After consideration, it was decided to send copies to each affiliated society for their information, in order that at a future conference some decision may be arrived at.

The Secretary reported that with regard to the petition to the Railway Clearing House, asking that the facilities now given to delegates and representatives at other meetings, anglers, golfers, &c., should be extended to exhibitors and officials attending shows, about a hundred societies and fanciers' clubs, representing 2,000 members, had signed. The Kennel Club and the Royal Agricultural Society of England were acting with them. (Hear, hear.)

Mr. Bohane, Secretary of the Royal Lancashire, congratulated the federation upon having taken the initiative. It was a burning question, and it ought to have been taken up long ago.

The annual meeting and dinner was fixed for December 15 at Southport, and it was decided that, failing Sir Lees Knowles's acceptance of the presidency, Mr. W. Ashley, M.P., be invited to the position.

Lincolnshire Agricultural Society.

The council met at the society's rooms, Lincoln, on Friday week, Sir John H. Thorold, Bart., in the chair.

The secretary reported that arrangements had been made for all members of the society subscribing not less than 20s. for the year 1907, and having paid their subscription for 1906, to enter stock, &c., at the same fees as members of the Royal Agricultural Society of England and have free admission to the show for the whole of the meeting; and for members being annual subscribers of 10s. for 1906 and 1907 to have a free ticket giving admission to the show each day.

Arrangements were made and members of council, &c., appointed to carry out a canvass for new members; and instructions were given that the privileges of membership should be printed and circulated throughout the county by such sub-committees.

British Dairy Farmers' Association.

At the recent meeting of the British Dairy Farmers' Association it was reported that the receipts for the admission of the public at the recent Dairy Show were in excess of all previous records, and that the receipts from other sources were entirely satisfactory. The Show Committee reported upon a number of matters arising out of the exhibition, and made various proposals with regard to the future. The council considered and dealt with protests against the award of certain prizes, were not upheld.

A return was submitted showing that in the nine weeks ended November 3 the imports of fresh milk into the United Kingdom amounted to 321, against 53 cwt. in the corresponding weeks of last year. Of cream the imports reached 886, compared with 1,034 cwt.; of preserved milk 2,632 against 776 cwt.; while the imports of condensed milk were 183,282 cwt., or 18,000 more than in the corresponding weeks of last year.

On the recommendation of the General Purposes Committee it was agreed to make a series of analyses of imported milk, especially with a view to ascertain the presence of preservative as well as its nature and proportion.

The next meeting of the council was fixed to be held on Tuesday, December 11.

NOTES AND NEWS OF AGRICULTURAL SOCIETIES.

Central Cornwall Farmers.

According to the report presented at the thirty-seventh annual meeting of the Central Cornwall Farmers' Association, during the past season some 600 tons of manure had been bought through the association, and the analysis had proved the manures to have been of a very high standard. The following officers were elected for the ensuing year:—President, Mr. C. Menhinick; vice-president, Mr. John Key, St. Breock. The general committee were re-elected with few additions, and the secretary, Mr. Truscott, was re-elected.

East Kent.

The report presented at the annual meeting of the East Kent Agricultural Society showed that the society's annual show held at Ashford this year in conjunction with the Ashford Horse Show, proved most successful, there being a net balance from the show of £100 16s. 10d., £24 5s. 6d. of which went to the East Kent Agricultural Society and £45 11s. 4d. to the Ashford Horse Show. The election of president of the society was deferred until the venue of the next annual show had been decided. A letter was received from the Ashford Horse Show Society, suggesting a meeting between deputations from the Ashford and East Kent Societies, to make arrangements for the future. It was decided that a meeting of the delegates should be held at Canterbury on November 24.

Furness.

Although only formed on August 31, 1905, the Furness District Farmers' Association has now a membership of 200, and has had a most successful year's work as well as a satisfactory financial working, there being a balance in hand, £18 7s. 3d. At the recent annual meeting it was generally agreed that the association had made a most satisfactory beginning, which will urge the members to do even better in the future. Mr. Myles Kennedy, J.P., was re-elected as president; Mr. W. Lewthwaite, Broadgate, as vice-president; and Mr. F. W. Poole as secretary. The question of the desirability of forming a kind of toutaine society for the insurance of stock in the society's district was brought forward, and the suggestion being well received by the meeting, it was resolved that the matter be referred to the committee for further consideration, and report to a future meeting.

Horsforth.

The annual meeting of the Horsforth Agricultural Society was held on the 9th inst., Dr. Bailey in the chair, and there was a good attendance of members. It was reported by Mr. Clough, one of the hon. secretaries, that the society had £55 15s. 2d. to the good. Next year's show was fixed for the last Saturday in May—viz., May 25. The secretaries also announced that a silver cup had been presented by a member of the committee for competition in the house section. The hon. secretaries, Messrs. Thos. Clough and R. B. Thackray, were reappointed.

Hunts Chamber.

In the course of the report presented at the annual meeting of the Hunts Chamber of Agriculture it was stated that the membership had increased during the year from 131 to 303, a highly satisfactory state of things due to the energy of the chamber and other members. The financial statement was also gratifying, for it showed a balance in hand of £39 9s. 6d. It was stated that the Hailstorm Relief Fund amounted to £4,300, but it was confidently hoped that the total would reach £5,000. Mr. H. C. Sweeting was unanimously elected chairman for the ensuing year, and other officers were elected.

Monmouthshire.

A general meeting of the Monmouthshire Chamber of Agriculture will be held on Wednesday next, at 2.30 p.m., at Newport, the chief feature of which will be a discussion on the Purchase of Land (England and Wales) Bill, which will be introduced by the Right Hon. Jesse Collings, M.P., who is the promoter of the Bill. Other business is:—Election of new members and other general business, including minutes of last meeting, and acknowledgments from the Prime Minister, the Chancellor of the Exchequer, the Secretary of State, the Board of Agriculture and Fisheries, the War Office, the Right Hon. Viscount Tredgar, D. A. Thomas, Esq., M.P., Colonel Ivor Herbert, M.P., and the Central Chamber of Agriculture, of the resolutions passed at last meeting; to consider circular from Central Chamber re annual agricultural dinner in London during Smithfield Show week; to consider circular from Hunts Chamber of Agriculture respecting relief fund for the sufferers from the great hailstorm on Aug. 2; to discuss the question of the Army meat contracts; to discuss the report of the

Royal Commission on Motor Cars; and to discuss the question of local taxation (adjourned from last meeting of Central Chamber to the December meeting).

Scottish Chamber.

A special meeting of directors of the Scottish Chamber of Agriculture will be held at No. 5, St. Andrew Square, Edinburgh, on Wednesday at 10.30 a.m., when the business will be as follows:—(1) Review of the second reading of the Small Landowners' Bill coming on soon, considering recommendations by chairman's committee with reference to that Bill;—(1) generally and (2) particularly in relation to the Board of Agriculture—proposal to ask Secretary for Scotland to receive deputation. (2) Motion by Mr. Rutherford re chairman's committee. (3) Marking of home produce. (4) Railway company's "owner's risk," rates, and consignment notes. Railway (Contracts) Bill.

Thorpe Audlin Farming and Rural Association.

The annual meeting of the above association was held at Thorpe Common Cottages, near Pontefract, on Wednesday evening last. There was a full attendance of members, and business matters were pleasantly and speedily gone through. The report showed the association to be in a sound condition financially, and great satisfaction was expressed with regard to the amount of work gone through during the year, also the success of two of the members in having passed the Board of Education's examination in Agricultural Science and Rural Economy. These successes are undoubtedly owing to the efforts of Mr. W. Pool, of Badsworth, the able and efficient lecturer to the association. There was a strong feeling prevalent in the meeting of eager anticipation for the coming season's work, which speaks well for the future success of the association. The chairman and hon. secretary both resigned from their positions, and Mr. Thomas Tane was elected chairman and Mr. E. Harrison, hon. secretary. These were all the changes effected, the meeting being brought to a close amid heartily-expressed feelings of good fellowship.

Mr. William Harrison and Messrs. Harrison, McGregor and Co., Ltd.

On Monday, at a meeting of the directors of Messrs. Harrison, McGregor and Co., Ltd., Albion Ironworks, Leigh, Mr. W. Harrison, J.P., resigned his position as general manager of the company, in order to take up a very important position with the firm of Messrs. J. Buchanan and Co., distillers and blenders, London. Mr. Buchanan, the head of the firm, has been an intimate friend of Mr. Harrison for the last twenty years, and Mr. Harrison has consented to be the manager of the Lancashire business of the firm, with offices in Manchester. He will, however, retain all his interest in Harrison, McGregor and Co., Ltd., and will continue to be chairman of the directors as at present if the directors so desire; in fact, it is Mr. Buchanan's special wish that he should give all the active support he can to the Albion Ironworks, and also retain his position as a member of the Council of the Royal Agricultural Society of England, the Royal Lancashire Agricultural Society, and the Agricultural Engineers' Association and the Tariff Commission. Mr. Harrison will continue to reside in Leigh, and remain in close touch with the business, and with those interested and working in the Albion Ironworks. It is gratifying to Mr. Harrison to be resigning his position as general manager of the ironworks at a time when the business is in a prosperous condition. As a matter of fact, the year ended September 30, 1906, has been a record one in the history of the concern, the sales having been £20,000 more than in any previous year, and the prospects for the future are very encouraging. Mr. Harrison, after being educated at the Leigh Grammar School, under Mr. Ralph Pusey, went to Paris in 1875, and entered the counting-house of Messrs. Waite, Burnell and Co., agricultural implement and seed merchants, Paris, and was with them till 1881, when he returned to Leigh and went through the Albion works and learned the practical part of the business. He went back to Paris in 1884, to take up the management of the French business of Harrison, McGregor, and Co. He relinquished this post in 1890 and returned to the works at Leigh. At the beginning of 1894, owing to the unfortunate illness of Mr. A. McGregor, he took up the management of the Albion works, and despite fierce competition in the past of the American and Canadian manufacturers the business has enormously increased, as will be seen by the following figures showing the sales of machines:—

	1893	1906
Mowers	1,825	6,437
Reapers	531	1,611
Binders	—	1,179

Weights and Measures. ONE of the most puzzling things to a man who has anything to do with the buying and selling of fruit and vegetable produce, and moves from one place to another, is the way in which weights and measures vary in different localities, and why in the name of all that's reasonable standard imperial weights and measures should not be used all over the country is a thing we quite fail to understand. What between pots, kipes, strikes, and other local terms, the whole thing is a perfect muddle, with nothing consistent about it, and the first thing a man has to do when he moves from one district to another is to initiate himself in the mysteries of the local weights and measures. That we should stick to this old-fashioned system of muddle is another sign of our sheer conservatism, because with an imperial standard before them there is no reason why buyers and sellers everywhere should not adopt it. In a very short time people would get used to standard weights and measures that would be comprehensive to everybody, but this one difficulty seems to be that of breaking away from an old order of things that is nothing but disorder.

Fighting Rats and Sparrows. WHEREVER farms are there will rats and sparrows be, and they seem to show their affection for the habitations of farmers by sticking closer the more they are persecuted. Rats are an unmitigated nuisance anywhere, and so are sparrows under certain circumstances, and though every man's hand is against them they thrive and multiply. We notice, by the way, that the Hamstreet and District Agricultural Club in Kent has decided to adopt organised methods in the destruction of these pests, and this strikes us as being the only rational way of dealing with them. Take rats, for instance. The way some farmers tolerate these destructive rodents without making any apparent effort to get rid of them is really surprising, and if they are to be cleared out of a district there must be combined effort. In the case of the Hamstreet Agricultural Club the district embraced is practically the whole of the Romney Marsh, and an important branch of farming there is the growing of turnip seed. The ravages of birds amongst this crop makes it very necessary that prompt steps should be taken to deal with the feathered pests, but this is not the only locality in the country where sentiment must be sunk in the interest of growing crops. We have never known anyone to hold a brief for rats, but many well-meaning persons defend birds, even sparrows, and we should be the last to advocate killing the homely chirruper merely for the sake

of doing so. In the interests of agriculture, however, it is essential that injurious creatures of any kind should be prevented from getting too numerous.

Moles and Mole Catchers.

IN his way the mole is a useful creature and eats a good many insect pests in the ground, but we can easily have too much of him, and he adds to the worries of farmers when whole fields are tunneled under and hillocks of earth are thrown up in every direction. In such cases we naturally forget all about the usefulness of the mole and are seized with an overwhelming desire to get rid of his unwelcome presence. This is not always such an easy thing as it looks, and it is not every man who is master of the art of molecatching. It has been said that good molecatchers are born with the capacity, and though we would hardly go so far as to uphold this contention, we know there are men who have lived on farms all their lives and yet know no more about setting a trap and catching a mole than a costermonger from Whitechapel. While others seem to know by instinct just where to fix the trap and generally succeed in getting their mole. Some of the most expert molecatchers we have ever met hail from the Westmoreland and the Lako district, and on some estates we know, men from the above county are engaged by the landlord to keep down the moles. On many estates, however, there is no organised system. The landlord does not bother about moles, and the farmers cannot, or will not, catch them, so they thrive and multiply and become a general nuisance.

Piecework and Day Work.

IN a recent discussion which took place at a meeting of the Farmers' Club one of the speakers urged that piecework was more economical for the master and productive of more contentment to the men. Taking a broad view of the matter, we are inclined to think that there is a good deal in the contention, though of course, much depends on the character of the master and also the man. There is much work on a farm that cannot be done by the piece, but there is also a good deal that may be, and while men often work harder on a bargain job the master is relieved of considerable responsibility. A labourer who takes work by the piece is less of a machine and more of a man, because he acquires a habit of relying on himself and his own judgment, and the experience improves him. What spoils the spirit of piecework is the straw-splitting that is often connected with it. If a master in setting a job screws it down to the utmost farthing the

man is tempted to scamp the work in order to get his money, but get a honest labourer, who will make a good job as a matter of principle, and a master who is fair and open-minded, the piecework system has much to commend it, as being the best for both parties concerned, and if a man does make a shilling or two extra through taking a job by bargain it usually comes out of his own bones rather than his master's pocket.

Footpaths.

WE met with a farmer the other day who vowed he would give notice and leave, not because he had anything to say against the landlord, but because there are public footpaths running through practically every field on his farm. Some of them are altogether unnecessary, as they run parallel to a main road on the other side of the hedge; but, as everyone knows, the British public holds strong views about shutting up a footpath. In this respect the British public is unfair, and while resenting the mere suggestion of closing a footpath the people who use it take it as a privilege to walk on either side of the definite track until the footpath becomes as broad as a public highway. Prosecution for damage is the remedy, you say, but if a farmer who has a footpath running nearly every field on his holding, and prosecuted every time a pedestrian strayed from the track he would have to take apartments at the nearest police-court. We have remedies for many grievances, but it is not always easy to apply them, and we contend that the value of a farm is lessened if it is intersected in every direction by public footpaths.

Roads on the Farm.

DURING the dull days of winter, both before and after Christmas, actual cultural work is not so pressing on the farm, and the time is opportune for paying attention to jobs that have to stand aside during busier seasons of the year. One of these tasks is attention to roads, and on many farms this item is deplorably neglected. It is not an uncommon thing when you turn off the King's highway to go to a wayside farm, that you find yourself on a track full of holes and ruts, and to drive along it is not only uncomfortable but positively dangerous. How on earth some of the lads who have to run milk to the station night and morn'g manipulate farm roads and get on to the highway without turning over the milk and breaking their necks, is often a mystery to us, but it is a great wear and tear to both horse and vehicle. Then there is the comfort of the thing. How much more easy it is to do carting and get about a farm if the roads are good, and the reason why many are in such a bad state is because they are neglected. To keep a

road in good order the ruts must be filled up from time to time, and the sides kept clear so that the water can drain away. Of course the responsibility of good farm roads is shared by landlord and tenant, and they should both do their part in their mutual interests.

Hunting Farmers.

WE do not wonder that farmers who can afford to do so follow hounds, because the taste for sport is as firmly implanted in the breast of the agriculturist as in that of the aristocrat, and who will say that there is not something delightfully exhilarating in a gallop across country with the hounds in full cry. Just when a farmer can afford to follow hounds is a matter which he alone can decide, and there are many sad instances to-day of men who hunted regularly in the palmy days of agriculture, but made the fatal mistake of sticking to the sport and neglecting the farm when prices began to fall and all their time and attention were needed at home. There is a good deal of difference, however, between hunting regularly and hunting occasionally. The man who follows hounds several days a week must have a banking account to support it, and few working farmers can do this, but we have not a word to say against a man who keeps a horse that can jump, and when the hounds

come his way, puts the saddle on his mount, and has a gallop in their wake. Why shouldn't he? The sport-loving farmer does more than a little to preserve the foxes, why shouldn't he join occasionally in the fun?

Rabbits and Rabbiting.

FARMERS earned the name of being a hospitable class of people years and years ago, and the reputation is kept up by the practitioners of the present day. "Come and have a day's rabbiting" was the invitation we received quite recently from a farmer friend, and we went. It was a kind of a field day, as several other friends were invited to shoot, while the labourers manipulated the ferrets. Rabbits bolted well, we had good sport, and we thoroughly enjoyed ourselves in a homely sort of way. The chief item of interest, however, was the delight our host took in seeing his friends enjoy themselves, and at mid-day the big table in the dining-room groaned with its weight of solid farmhouse fare. We may be justly proud to think that this spirit of hospitality and goodwill is still alive amongst the farming fraternity, and so far as sport is concerned the tenant farmer in these days is more fortunate than his forefather in being privileged to offer his friends a day's rabbiting, even though he does not make so much money as his grandfather did.

Agricultural Politics.

BY A LOBBYIST.

Mr. Rider Haggard's Exaggerated Fears.

TO Mr. Rider Haggard the Land Tenure Bill hath a more appalling guise than even its most relentless Parliamentary opponent has attributed to it. It is in its sinisterness a very Hyrcan bear. Frankly, I am not dismayed by his belief that it will destroy the amenities of the country-side, that it will tend to banish sympathetic landlordism, and that it will only encourage that very big landlord who, destitute of traditional affection for the land, will simply buy out the tenants whose displacement is necessary for the accommodation of his pheasants and partridges. We have heard the first of these two assertions made on every occasion on which an attempt has been made to modernise the tenure laws. After all, too, apart from the proposals in regard to game, the more significant anxieties of this Bill reflect an aim which once possessed Mr. Walter Long, who is scarcely a revolutionist, and is surely not an anti-landlordic, or else simply embody the suggestions of a Commission, one of whose distinguished members was Mr. Henry Chaplin, who again can scarcely be described as an anarchist in the matter of tenure reform.

There are provisions which go beyond these suggestions of Mr. Walter Long and of the Royal Commission; but at least those proposals may be said to be salient points of this Bill. In view of these facts the contention of Mr. Rider Haggard that the proposals of the Bill would be paralleled by the demand of landlords that they should be compensated for the loss of a good tenant and for the expense in getting another lacks—well, lacks that logic, well-balanced perception and statesmanlike grasp which we have hitherto wisely associated with Mr. Rider Haggard. The distinguished farmer-novelist has given his imagination loose a rein that it has got the bit between its teeth and is running away with his native common-sense. And if the third proposition were realised, if big capitalists were to seek to lay fallow the soil in order to breed game, and game only, they would invoke their own undoing. Statecraft would never permit the mathematical displacement of men for birds in order that wealthy selfishness might, in the encouragement of their borrowed sportive spirit, avoid the responsibilities of the Land Tenure Act and their duty to the community. This determination is, I can assure Mr. Haggard, very apparent in this Parliament. And the Lords would be no barrier to a policy which could be accomplished by means of the Budget.

Mr. Haggard's Judicious Warning.

Where Mr. Rider Haggard is right is in his anticipation that the new legislation may prove the antagonist rather than the friend of the small-holdings policy. Landlords will naturally hesitate to cut up their farms into small holdings when they know that as a result this

policy and their own recognition of the trend of agrarian economy, they would penalise themselves by adding to their compensation-responsibility, whilst actually introducing a rival ownership to their own in the soil. This is a perfectly clear and precise anticipation. The experiment of small-holding colonies will possibly be brought to an end that is, unless the Government step in in a paternalistic capacity, establish a system of modified State ownership, or utilise the resources of the State in the voluntary dispossession of landlordism, as Mr. Jesse Collings purposes, in order to create small owners under theegis of the nation. If this Land Tenure measure did not, indeed, have as a corollary a Small Holdings Bill on the lines which both Sir F. A. Channing and Mr. Collings have indicated, it would mean a dire blow to the small holdings experiments.

Wisdom from Tariff Reformers.

There are two phases of the report of the Agricultural Committee of the Tariff Reform League which must be particularly gratifying to the MARK LANE EXPRESS. With the third phase, the free competition of foreign rivals, who pay neither rates nor taxes and meet no national responsibility, I need not for the moment deal beyond to ask one question: How is the British farmer, market gardener, or small holder to benefit by the discouragement of the foreigner by means of a tariff if the colonial competitor is not only to be admitted free, but to be encouraged to be a more effective rival than the foreigner ever was? The two phases have been again and again emphasised in this column. The first is that the English Board of Agriculture is so parsimoniously provided with funds by the State that it can never in its effectiveness vie with the parallel departments in our own colonies and on the Continent. Our department can be little more, with its poor equipment, than a department of pious professions and of portly parables. Given ten, or even five, times the money it has now at its disposal, and it might be as direct an influence in agrarian prosperity as is the Canadian department in the weal of the Canadian farmer. The second point is that the over-taxed British farmer has to pay much more for the moving of his goods to the markets than has his foreign rival—a fact which in itself militates against his spending as much as his rival on wise package and secure consignment.

In emphasising these two points this Agricultural Committee has pointed out a national duty which has no more to do with Protection than it has with Free Trade—which involves an absolute responsibility upon every Parliamentarian who desires that British agriculture should, in the economic race, have fair play and judicious assistance. We want a Board of Agriculture that shall be something more than a platitude. We want a distributive system that shall be something more than a penalty.

Is the Appointment well for Farmers?

I have no doubt that the appointment of Sir James Woodhouse to the vacant Railway Commissionership will be absolutely justified in its general results. Sir James Woodhouse is a man of great industrial experience, of undeniable sagacity, and of high character. All the same, however, he represents a phase of enterprise already adequately represented. Commerce had its direct representative on the Commission—agriculture had no direct representative. The nomination of Sir James Woodhouse thus means that agriculture—vital as are its concerns with the work of the Commission, fateful as may be the Commission's decisions to the weal of the interest—is still without any direct representation. It cannot be said, too, that Mr. Lloyd-George, the President of the Board of Trade, was without a choice in this business.

As a fact, one distinguished colleague in the House who was a candidate for the position—and who, I ween, had a more powerful backing than had Sir James Woodhouse—has not only made a study of agrarian economics and conditions, but he has given this study so disciplined a character that he now enjoys, more particularly on the Liberal side of the House, the reputation of an expert. Beyond this, too, he is also known to have a clear and cogent grasp of the Local Government problem, as a result of administrative experience at the Board. The deliberate setting aside of the claims of this eminent man and of the interest he represents—this setting aside of his claims in order that commerce might monopolise the *personnel* of the Commission—is electorally a mistake. It suggests again, despite the anxiety of Liberals to pose as the only hall-marked friends of agriculture, that the party cares infinitely more for urbanism than for ruralism. Sir Frederick Peel was in a large sense a representative of ruralism. As a result of Mr. Lloyd-George's new appointment—which certainly has several justifications on mere personal grounds—ruralism is without that representation.

The Lord Chancellor and the Magistracy.

You may not have gathered the fact, but it is undeniably the case that the Lord Chancellor—the darling of assertive Radicalism when he was Sir Robert Reid—has become almost obnoxious to the nostrils of the faithful. This is all because of his appointments to the county magisterial bench. "Restore the balance of parties," clamoured the Liberals when, from Sir Robert Reid, evolved Lord Loreburn, Lord Chancellor of England and Keeper of the King's Conscience. "I do not see," said his lordship in effect, "what partyism has to do with the administration of justice." Undismayed by these rebuffs, the Liberal agents sent him sheafs of names belonging to persons who had, in their own parlance, fought the good fight—in other words, had been effective Liberal emissaries. Still the Lord Chancellor was resolute. He was, said he in effect, not the real nominator, the nomination was with the Lord Lieutenant, be he Liberal or Tory; the Lord Chancellor had only the duty of ratification. "Do what Lord Herschell threatened to do," demanded the agents—"over-ride the lords lieutenant. Their power of nomination is not a constitutional right—it is only a complimentary concession." Lord Loreburn has refused to do this; and hence it is that it is the lord-lieutenants' nominees rather than the Radical agents who find themselves given the right to affix the letters "J.P." to their names. Of course, to a certain section of the Radical mind this refusal to make the paid monetary of the faith, the agent, the disposer of magisterial dignity is an appalling sin—something worse than an offence against the Deaconess or the refusal to make Dr. Clifford the Dictator of Faith to the country at large. Still, I opine that there is a staple section of the community who will regard this resolution with equanimity, nay, with appreciation. This section believes that the administration of justice will be cleaner if its fount be the lord-lieutenant's serene judgment.

The death occurred at Garforth last week, with startling suddenness, of Mr. Emmons Pickering, one of the largest and best-known cattle dealers in the North of England. Mr. Pickering was the owner of large estates at Dotterell Park, between Bridlington and Scarborough, and at Driffield. His interests covered a wide district, and his comparatively early death will cause widespread regret.

NORWICH FAT STOCK SHOW.

The festive season has already heralded its approach by the advent of this, the first of the great Christmas fat stock shows, which opened to the public on Thursday last at the Agricultural Hall, Norwich. The weather on the day previous to the show as well as on the first day of the exhibition was unseasonably mild, and very oppressive for the cattle. As the space available for them is very limited, crowding has to be resorted to if the whole of the entries are to be accommodated. The attendance, too, at Norwich always appears to be so great as to very much congest matters, especially towards evening, by which time the heat becomes far too great to be wholesome for either man or beast. It seems rather a cause for regret that so useful a building cannot be amplified, seeing there is ample unenclosed space adjoining; however, such a suggestion has no doubt been made a long time since. The number of entries of cattle fell some twenty short of last year, the falling off being chiefly noticeable in the local classes, butchers, and small cattle. Some of the other sections also fell much short of years ago, especially the class open to all breeds, which upon this occasion contained but three animals. There is a falling off of one or two leading exhibitors' entries as seen some years ago that makes itself rather severely felt in so small a show. The absence of some of these animals from the leading classes leaves rather a blank that is noticeable. The general quality of the stock is not of a very high level, so many cases of plainness in shape or want of more size or growth being conspicuously present, yet the best animals will probably be able to hold their own. The most noticeable feature, perhaps, in respect of the general standing of the exhibition is the ontario absence, or nearly so, of purely bred stock of two or three of the leading breeds. Devons have not a single representative, Herefords but one, and Angus not more than two or three, whilst Shorthorns are made up mostly of what may be termed misfits from the breeding ranks, and crosses never make a good uniform display, varying so much in size and other respects. The native Red Polls, too, this year are not a very satisfactory section. There are some big, good Irish cattle, and two or three very perfect small cattle. Sheep and pigs are good.

Red Polls.

As is natural in their own home, the solid coloured reds take precedence in the catalogue, and of the four young steers competing Sir Walter Corbett's yearling by Albert was accounted the best. In weight he is satisfactory, but as regards his symmetry and covering of roasting beef, he

might be considerably better; he records 12 cwt. 2 qr. 16 lb. in the scales. The Right Hon. A. E. Fellowes scores second with a well-ribbed, very neat steer of good quality by Arthur, and two very promising though backward steers from Sir Thomas Good's herd filled the third and reserve places. There were only two older steers shown, Sir Walter Corbett's by Lord Rattler, a symmetrical, ripe, good stamp of steer by Lord Rattler with 16 cwt. 12 lb. to his credit in the way of the scale, placed first and eventually champion of the section, and a bullock of Sir R. P. Cooper's by Felix scaling 15 cwt. 10 lb., and of good feeding and quality. Mr. Fellows scored both first and second prizes for females with two very tight, nice quality heifers, Advent and Appendix, ripe and weighing capably. Mr. J. B. Dimmock had also a very good heifer breed.

Shorthorns.

Steers above two and not exceeding three years old were well represented, and competition was fairly close between the three first animals. These were Mr. E. T. Learner's Great Scot, a short-legged red and white, full of good flesh well carried and capably brought out, Scotch bred, and scaling the respectable record of 18 cwt. 2 qr. 20 lb., placed first; Miss Alice de Rothschild's roan, just under the age limit, bred by exhibitor and sired by Waddlesden Youth, an evenly-fed steer, full of quality and carrying himself uncommonly well with a weight of 17 cwt. 1 qr. 11 lb., placed second; and Mr. R. W. Hudson's steer of the Marquis of Exeter's breeding, got by Baron Wesham, full of good roasting beef, and firm and well finished at 17 cwt. 1 qr. 16 lb., given the third prize. H.M. the King also obtained a reserve here with a big good topped white steer. Females of this breed were also fairly well represented with four neat heifers with quality. Mr. E. T. Learner's Lackadaisical was given preference in these; a short-legged heifer with fore-end well covered, and good in her top line, bred by Mr. John Ross and sired by Ajax, her weight 15 cwt. 1 qr. 18 lb. H.M. the King's Fragrant Spring, very evenly fed and handling well, sired by Royal Advance, bred in the Royal herd and placed second, leaving reserve to Sir R. P. Cooper's Leighton Princess 17th, a level-fleshed, good-coated young cow of 15 cwt. 3 qr.

Steers of other Pure Breeds.

This class in years gone by was one of the most important, frequently holding a first-class Devon or two, Hereford some, as well as Angus, whilst this year one of the latter breed, one Hereford,

and one Galloway constituted the total. The former, Mr. Hudson's Danesfield Negro, was easily the best, as he is thoroughly finished, well covered in his roasts, and scaling 16 cwt. 2 qr. 18 lb., though in his general contour he is rather short, and none too even in his flesh; he was, in addition to his first prize, also awarded the special prize for the best ox or steer in the yard. Mr. E. T. Learner's somewhat plain Hereford was awarded second, and the reserve was given to Mr. Earle's Galloway. Steers of this section under two years old were headed by another steer of Angus blood from Mr. R. W. Hudson's herd, particularly well built and very even in his flesh and good in quality, he scales 12 cwt. 0 qr. 16 lb. Sir Frederick Adair had a very shapely though backward steer placed second, and Mr. L. J. Thurman a very promising one third. The old cross-bred steer class brought out several extraordinary good beasts, the best of these being Mr. R. W. Hudson's Danesfield Blue Boy, the heaviest beast in the hall, 19 cwt. 0 qr. 3 lb., very evenly fed, famous top and roasts, and fore-end capably covered. Mr. W. Cattle came second with a somewhat lighter but very ripe and symmetrical steer of Mr. John Ross's breeding; a second entry of Mr. Hudson's, very level and good in this general quality was third. Mr. T. B. Earle, Mr. Goodman, and one or two other exhibitors were also well represented. Cross-bred cows or heifers have usually been one of the best classes, and though not strong numerically, yet this year the best animal of the show is found here; this was, according to the judges' opinion, Mr. E. T. Learner's Angus and Shorthorn cross of Mr. John Ross's breeding, certainly a neat little heifer, and probably a good competitor for a light-weight butchers' class, but as far as being a suitable beast to be put before the public as champion of a fat stock show amongst the large breeds and their crosses, she can only be looked upon as a failure, and not the class that either breeder or grower should encourage, for an animal that takes just upon three years of the most expensive feeding and skilful management that can be brought to bear upon it to make up a live weight of 13 cwt. 0 qr. 1 lb., cannot but be a ruinous speculation to the breeder and feeder. For reserve to this beast for the championship the judges selected Mr. R. W. Hudson's champion steer. The second heifer in the class was Mr. R. W. Hudson's Danesfield Honey Bee, a heifer of similar breeding to the first-prize one, and fed to the highest pitch with a weight of 13 cwt. 3 qr. 1 lb., the finest possible symmetry, and a wealth of flesh evenly laid on that is not often seen. Probably 95 per cent. of the visitors to this show would have placed the champion honours upon this heifer without a moment's hesitation, so that the announcement that she was defeated in her class and not even given reserve

CHAMPION RED POLLED STEER AT NORWICH.

The property of and bred by Sir Walter Corbet, Bart., Acton Reynold, Shrewsbury. Winner of the Special Prize for the best Red Polled beast at Norwich. Age 2 years 10 months and 1 week. Weight 16 cwt. 0 qr. 12 lbs.

for the championship, fell with a dead weight upon the minds of most people present. Mr. Thuman, Mr. T. B. Call, and Sir Frederick C. V. Adair, had also very useful females here.

Local Classes.

The Norfolk-fed classes brought out a number of extra ripe beasts, though in most of them there was a certain amount of conspicuous faults when looked upon in the light of show cattle. In young steers H.M. the King was first with a very mellow level white by Royal Castle that should come out well another year. Mr. T. A. Barton and Mr. R. Mattocks also carried off prizes with very shapely steers. In older steers the Royal herd was again successful with a good-backed roan by Jester, and Mr. Mattocks and Mr. Barton again followed pretty closely. In the female classes—rather a good one—Mr. Barton turned the tables upon his Majesty, coming to the front with an Aberdeen-Angus of quality but of excessively light weight, 11 cwt. 2 qr. 1 lb., against Crystal Maid, from the Royal herd, a well-finished young cow with a good top of roasting beef, and her hind-quarters well packed. Mr. Alfred Rowell, Mr. Le Neve, and one or two other Norfolk feeders were also honoured for very fair exhibits.

Small Cattle.

From this section we missed one or two very prominent exhibitors in the past, and this year only five animals were entered in the two classes. Of females, Mr. R. W. Hudson had the best, a very sweet, perfect heifer, well ripe at a year and nine months, scaling 8 cwt. 0 qr. 25 lb., and Sir Walter Gilby filled second place with a little red heifer, bred by the Marchioness of Conyngham. In steers, the first honour also went to the Danesfield herd for an extraordinary shapely and well fed steer of 8 cwt. 2 qr. 1 lb., second to his Majesty, and third to Sir Walter Gilbey.

F. F. Buxton's second, weighing 7 cwt. 0 qr. 20 lb. Mr. Hunter being reserve with another pen of Hampshires. In the open class for lambs other than Southdowns, Suffolks had the best of matters, Captain A. B. Fielden being first, and Mr. H. E. Smith second with very fine pens both in breeding and meat. These sealed 5 cwt. 2 qr. 19 lb. and 5 cwt. 0 qr. 9 lb. respectively. Mr. Buxton's reserve Hampshires being 5 cwt. 2 qr. 9 lb. Mr. Thomas Rush had also two pens of fine Oxford and Hampshire crosses that were awarded first and second prizes in this class, with a weight in their favour of 5 cwt. 3 qr. 20 lb. and 5 cwt. 2 qr. 20 lb.

Pigs.

These were very good in quality, especially the White classes. Earl Cadogan and the Exors. of the late Colonel McCalmont won in Berkshires, and Mr. Alfred Brown and Mr. William Mitchell in Whites over six months old, these pens weighing 12 cwt. 1 qr. 8 lb. and 10 cwt. 3 qr. 22 lb. Mr. Alfred Brown and Mr. W. H. Webster had also very good cross-bred pigs that won in these classes.

Miscellaneous Exhibits.

There was an excellent show of dairy produce. In the class for butter made entirely from Channel Island cows, Mr. Martin Birkbeck, Postwick, was first, and Sir Edward Birkbeck second. In the next class—butter made from cows not of the Channel Island breed—the first prize went to Mr. George Smith, Orford Place, Norwich, and the second to the Right Hon. A. E. Fellows. For preserved butter Miss Edith Bush was first and Mrs. James Gooderham second.

There was a large competition in the cream cheese section, Sir Edward Birkbeck taking the lead. For Stilton cheese the Eastern Counties Dairy Institute, at Ipswich, obtained both prizes; they repeated this success in the class for Cheddar cheese. The exhibits in each

A prize of the value of £15 for the best cow or heifer in the show.—1, M. L. Learner; 2, Mr. R. W. Hudson.

The "Members' prize, of the value of £15, for the best Red Poll beast in the show.—1, Sir Walter Corbett; 2, Sir R. Cooper.

A prize of the value of £15 for the best least in the show, leaved and fed in Norfolk.—1, Mr. T. A. Barton; 2, H.M. the King.

A prize of the value of 10 guineas for the best beast in the Small Cattle Classes, Nos 13 and 14.—1, Mr. R. W. Hudson; 2, Mr. R. W. Hudson.

A silver challenge cup for the best beast in the show exhibited by a Norfolk farmer.—1, Mr. T. A. Barton; 2, Mr. R. Mattocks.

SHEEP.

Champion prize for the best pen of sheep in the show.—1, H.M. the King; 2, Mr. R. Barclay.

Special prize of the value of £10 for the best pen of lambs in the show.—1, H.M. the King; 2, Capt. Fielden.

Special prize of the value of £5 for the best pen of shearing wethers in the show.—H.M. the King.

Special prize of the value of £5 for the best pen of sheep in the show exhibited by a Norfolk farmer.—1, Capt. Fielden; 2, Mr. J. Hunter.

Judges.

Cattle: Mr. D. F. Smith, Euston Park, Wickham Market, and Mr. R. Wright, Necton Heath, Lincoln.

Sheep: Mr. F. B. Jennings, Cockfield Hall, and Mr. S. Trevelick, Wadeston, Aylesbury.

Butchers' beasts and pigs: Mr. J. M. Outlaw, Pullman Market, and Mr. Frank Bards, Hunstanton.

Roots and grain: Mr. William Case, Tuttington Hall, Aylsham, and Mr. Charles Water, Postwick Hall, Norwich.

POULTRY.

Poultry-keeping in America.

Poultry breeders who would like to get an insight into the methods of breeders in Canada and the United States, and also obtain a few "wheezes," should expend a shilling on Mr. E. Brown's "The Poultry Industry in America," the report of his recent tour in the counties mentioned.

Mr. Brown's mission was to inquire—

1. As to the large establishments for the production of eggs which have been developed in the United States, especially as to their commercial and practical value, so as to learn whether they are successful, and if so, what factors contribute to that success, and how far the same system is capable of adoption in Britain.

2. As to the remarkable developments now taking place in respect to the production of table poultry in Canada and the United States, more especially in Kansas, Missouri, and Iowa.

3. As to the instruction, experimental and research work at the leading agricultural colleges and experimental stations in both Canada and the United States, where so much has been done, more especially in the direction of experiments, in connection with practical poultry-keeping.

4. As to the system of marketing adopted with regard to eggs and poultry, and how far by means of cold storage of these articles of food in the great centres the interests of producers are protected.

On all these points Mr. Brown deals fairly exhaustively, and his remarks provide most interesting reading, and, as he rightly remarks, if people in this country are prepared to take advantage of the information placed at their disposal in this report we may anticipate considerable development of the poultry industry in the United Kingdom, more especially upon lines which have as yet been attempted to a very limited extent. In many directions our progress, Mr. Brown thinks, has been much greater, and taking the country as a whole we can fairly claim to have achieved a larger amount of success than the Americans; but they, on the other hand, have gone beyond us in some branches, despite less favourable conditions. How far their methods can be adopted by us, Mr. Brown carefully indicates.

SCARCITY OF SMALL POULTRY-KEEPERS.

Mr. Brown first devotes some pages to the consideration of "Methods and Ideals," and in the course of these he remarks—

One of the most surprising features to the British observer is the almost total absence of suburban and small poultry-keepers, who occupy a considerable place in our home production. Throughout the residential and manufacturing districts of New England it is the exception to find a few fowls kept for the supply of the household requirements. And I was assured by one of the officials of the Department of Agriculture at Washington that this is true as regards the entire country. From my own observations the same remarks will apply to Canada.

The reasons given are two-fold; first, that the system of purchasing land instead of renting tends to smaller size of ground available around the dwellings. A man who buys a lot for the purpose of building a house generally is compelled to restrict himself severely in the area of ground. But also the custom of open courts without fences or back gardens of sufficient size makes the keeping of fowls more difficult; and, second, there would appear to be a feeling that it is hardly worth while to cultivate the ground or to keep fowls, and that unless a man can keep poultry on a larger scale, as a business, he prefers to leave them alone.

CROSS-BRED HEIFER, CHAMPION AT THE NORWICH SHOW.

This black Cross-bred Heifer was exhibited by Mr. E. T. Learner, Burgh, Aylsham, Norfolk, and won the Championship of the Show. She was bred by Mr. John Ross, Milleraig, Ailness, Ross-shire, and is 2 years 9 months 1 day old and weighs 13 cwt. 0 qr. 1 lb.

Other Classes.

Irish cattle and butchers' class here were not upon a very extensive scale, and do not call for any special comments. The chief winners in the Irish classes were Mr. Emery, Mr. Starling, Mr. Le Neve, Mr. Cooper, and Mr. Arthur Neave in the Irish classes, the weights of the winners ranging from 15 cwt. to nearly 19 cwt., mostly cross-bred and Irish Shorthorns. In the Butchers' class Mr. J. W. Weston and Mr. F. Nash won the prizes, the cattle weighing 15 cwt. 0 qr. 24 lb. and 17 cwt. 0 qr. 23 lb.

Sheep.

According to the distribution of honours the Southdown breed were the best, as the champion prize for the best pen in the show was awarded to H.M. the King's wethers, of this breed first in their class, ripe, and scaling 5 cwt. 1 qr. 11 lb., Sir Thomas Gooch being second in the class with a pen scaling 2 lb. heavier. Southdown lambs had rather a large entry, but the weights were very light, except this Majesty's first pen, which pulled up 4 cwt. 1 qr. 3 lb. The Exors. of the late Colonel MacCalmont and Mr. C. R. W. Adeane held the next best. There were three extraordinary good pens of Suffolk wethers, Mr. Robert Barclay's winning pen being 7 cwt. 8 lb. Mr. H. E. Smith had also a very good, though lighter pen, second. Wethers of other breeds consisted of a fine pen of Hampshire and Oxford crosses, shown by Mr. Rush, with a weight record of 7 cwt. 3 qr. 11 lb., given first prizes, and a pen of Hampshires of Mr.

of these classes appeared to be excellent specimens. As to the classes for students who have attended the dairy classes, held in the county, conducted under the auspices of the Education Committee, there was an excellent competition for butter made from cows not of the Channel Island breed. The specimens were really so good that there must have been great difficulty in deciding upon their respective merits. Eventually Mr. W. E. Sawyer was awarded the chief honour, Miss Mabel Smith taking second.

With regard to the roots, the mangolds were of a size and quality which indicated that Norfolk had had the advantage of copious and reviving showers, while the neighbouring county of Suffolk was suffering terribly from prolonged drought. For a like reason, the swedes on view were remarkably fine and well-grown. Lord Marcus Beresford, Newmarket, and the Earl of Derby, Newmarket, were amongst the successful competitors for the prizes offered by the principal seed firms in various parts of the country. There was also a good display of heavy wheat, while the barley was, on the whole, of choice quality.

Champion and Special Prizes.

CATTLE.

The Patron's prize for the best beast in the show.—1, Mr. E. T. Learner; 2, Mr. R. W. Hudson.

The President's Prize, of the value of £20, for the best cow or heifer in the show.—1, Mr. E. T. Learner; 2, Mr. R. W. Hudson.

SHOW GOSSIP.

Birmingham Cattle Show.

The fifty-eighth great annual exhibition will open on Saturday next in Bingley Hall, Birmingham, and continue on December 3, 4, 5, and 6. The entries received are as follows:—Cattle, 171; sheep, 60; pigs, 68; corn, 76; roots, 148; potatoes, 89; poultry 2,295; eggs, 31; pigeons, 1,067.

His Majesty the King has the largest number of entries in the fat stock classes, having specimens of Herefords, Shorthorns, and Devons from the Royal farms, Windsor, while Dexters and four pens of Southdowns will be sent from Sandringham. The challenge prizes, value £105 each, given by Messrs. Elkington and Co., Mr. J. Thorley, and Messrs. Webb and Sons, will again be competed for. There are also two £50 challenge cups, the gift of the proprietors of the *Birmingham Daily Post* and Mr. J. J. Cridlan respectively. In the sheep section there is the Cooper challenge cup, and the one offered for pigs is provided by the hotel and innkeepers of Birmingham. The Board of Agriculture and the local authorities have kindly passed special orders and issued licences to allow the exhibition of swine and to facilitate their movement to and from the show. There will be a very large and excellent show of corn, roots, and potatoes, and the usual number of attractive stands, implements, &c. The leading railway companies are running a large number of excursions at low fares.

Smithfield Club's Show, 1906.

The one hundred and eighth show of the Smithfield Club, the National Fat Stock Show of the Kingdom, opens at the Royal Agricultural Hall, Islington, on Monday, December 10, and continues during the four following days. Under the presidency of H.R.H. the Prince of Wales, the forthcoming show promises to be one of the most successful ever held by the club.

Entries from all the well-known feeders and exhibitors have been received, and comprise in the ordinary section of the show 283 head of cattle, 151 pens of sheep, and 125 pens of pigs. In the carcass competition 32 cattle, 70 sheep, and 36 pigs are entered, whilst 210 entries have been received in the table poultry section, the total number of entries being 937, as compared with 879 last year.

Prizes amounting to £2,013 are offered for cattle, £1,151 for sheep, £437 for pigs, £281 for carcass competition, £121 for table poultry, and £125 for the feeders of first-prize animals, making a total of £4,152. Included in these amounts are the magnificent challenge cups presented by His Majesty the King, for cattle; H.R.H. the Prince of Wales, for sheep; and H.R.H. the Prince Christian, for pigs, the winners of which also receive the club's gold medal.

It will be remembered that last year the challenge cup presented by H.R.H. the Prince of Wales for sheep was finally won by his Majesty the King, and a new cup has been graciously presented by his Royal Highness the president.

It is only natural that for these very valuable prize entries should be received from the most prominent feeders in the three kingdoms, the champion animals from Norwich, Birmingham, and Edinburgh meeting at the Smithfield Club's Show.

In addition to the money prizes in the carcass competition, challenge cups are given by the Butchers' Company of London in each of the three sections—cattle, sheep, and pigs. The cup for the best pig carcass was finally won last year, but a new cup has been generously given by the Butchers' Company for this year's show.

The implement section of the show will be one of its most prominent features. The whole of the available space downstairs will be taken up with the exhibition of steam and oil engines, gas engines with suction gas plant, thrashing machines, ploughs, &c.; the galleries being filled with mowing and reaping machines and other lighter agricultural implements, agricultural seeds, roots, feeding-stuffs, manures, &c., the whole forming the most complete museum of agricultural implements to be seen in the country.

NOTES.

A special meeting of the Tuthury Shire Horse and Meynell Hunt Society was held at the Institute, Tuthury, Burton-on-Trent, to consider the advisability of omitting the 1907 show and co-operating with the Staffordshire Agricultural Society's exhibition, to be held in Burton. Sir Oswald Mosely wrote that he felt it his duty to do all he could for the county show to be held in Burton next year, and strongly in favour of omitting the Tuthury Show for 1907. He suggested that the latter should be represented by a few classes at the county show, and should offer prizes, keeping the balance of the subscriptions to the Tuthury Society for a reserve fund for the

following year. They should also try their best to persuade Uttoxeter to do the same.

Captain W. Power (Tuthury) said he thought the feeling of the members of the hunt was that it would be a great mistake for the Tuthury Society to fuse with the County Show in 1907. The speaker then produced a letter from Mr. Gendall Hardy, Master of the Meynell Hunt, which said it seemed an unusual and undesirable thing to merge a Hunt Show into a County Show when the latter only comprised about half of the hunt country. A good many subscribers had expressed to him the objections which he himself held concerning the proposal. Captain Power subsequently stated that he was authorised to say that Mr. Fort (deputy master), Mr. W. Bass (Byrkley Lodge), and others would continue their subscriptions to the Tuthury Society, even should the feeling of the meeting be in favour of temporary fusion with the Staffordshire Show.

Captain Power then moved, and Mr. E. Ormo seconded, that the Tuthury Show be held at Tuthury as usual next year. Mr. Haywood moved an amendment that the show be incorporated next year with the county exhibition, provided that the prizes were given to Tuthury exhibitors on the second day on the same conditions as those which existed when the show was held at Tuthury.

Mr. W. C. G. BRITTEN,
Secretary, Hereford Herd Book Society.

bury. There was no seconder, and the resolution was carried with acclamation.

A joint meeting of the committee at the Notts County Agricultural Show was held at Retford. Suitable terms having been made, it was definitely decided to hold next year's show in the grounds of West Retford House, which had been viewed, and considered very convenient, being within easy reach and adjoining the Great North Road. The schedule was arranged, and it was decided to enter the Bassettlaw classes on the second day, the subscribers to have the same privilege as before. The Right Hon. F. J. S. Foljambe was elected president for the year.

At a general meeting of the members of the Lancaster Agricultural Society, held on Saturday last, the date of the show for next year was settled, viz., Wednesday, August 21. The probable dates of closing of entries are: General stock, August 7; poultry, August 12; and dogs, August 15.

The achievement of visiting Lancaster without having to draw on the reserve fund is considered by the council and members of the Royal Lancashire Agricultural Society as most remarkable, especially when the prize-list was not materially reduced from the great Liverpool Show, and, as you will notice, £3,125 lbs. 21 was awarded. The difference between this and the Liverpool total is principally made up by the great cart horse prizes, &c., which are such a feature when either Manchester or Liverpool is visited, and for which exceptionally good prizes are offered.

The result has chiefly been obtained by our now undertaking the fitting up of the showyard by our own staff, and (for the first time at Lancaster) taking over the whole of the public catering. These two departments have shown a saving to the society of nearly £1,500 as compared to the contract system.

Our membership has increased in a remarkable manner during the year. We have now 1,507 members of the society, the subscriptions from whom amounted to £1,908 6s. This is a net increase of £900 per annum during the last five years.

NOTES AND NEWS OF AGRICULTURAL SOCIETIES.

Totnes.

Mr. M. H. Hill presided at the annual meeting of Totnes and South Devon Chamber of Agriculture on Tuesday. There was a large attendance of members. The report of the council, read by the secretary (Mr. Alfred Tucker), stated that in the past year ten council and general meetings had been held, and among other subjects discussed was the great damage done by rabbits to growing crops. A resolution was passed by the chamber advocating payment by the Imperial Exchequer for animals compulsorily slaughtered when affected by anthrax; and that the whole cost of elementary and higher education should be borne by the Government. An invitation had been sent to Mr. Collings to attend a meeting of the chamber, when the subject of the Land Purchase Bill could be further discussed. The chamber joined the Mansion House Association on Railway Traffic in an endeavour to get a Bill through Parliament to make railway companies liable for loss, or undue detention of goods carried by them, whether the same was at the ordinary or reduced rate, and commonly known as "owner's risk rate." Mr. Midday, M.P., and Mr. G. A. Tozer were appointed a deputation to attend a meeting in London on the subject. The council congratulated members on the successful career of the association. Many new members had been enrolled during the year, and their loyal support was solicited for an industry still the greatest and most important for the nation's welfare.

Yeovil.

The judges—Messrs. T. Perham (Rymel), H. Willis (Nether Compton), and J. J. Ryall (North Wootton)—have made the following awards in the root competition organised by the Yeovil Agricultural Society in connection with their annual show, on September 13, as far as the mangolds are concerned. In class 41, for the two acres of mangolds, the prize of three guineas was won by Mr. A. J. Rowles, of Houndstone Farm, the weight being 62 tons 10 cwt. In class 42, three acres of mangolds, the prize was won by Mr. G. R. Terrell, of Easthams, Crewkerne. Mr. A. J. Rowles won the first prize in class 46, for a weight of 55 tons 15 cwt. 2 q. 2 lb. of mangolds, produced on two acres, Mr. A. James, of Newton Farm, being second with 50 tons 7 cwt. 0 q. 16 lb. In class 47, for two acres of mangolds, Mr. J. Gane, of Queen Camel, won first prize with 74 tons 17 cwt. 0 q. 16 lb. Mr. H. Helditch, of Stoke-sub-Hamdon, being second with a weight of 63 tons 12 cwt. 3 q. 12 lb. The silver plate for the best three acres of mangolds was won by Mr. J. Willy, of Coles Farm, South Petherton. Mr. A. J. Rowles won first prize in class 51 with a weight of 51 tons 17 cwt. 0 q. 16 lb., grown on two acres. Mr. R. A. Clarke, of Chiscliborough, won second with 40 tons 5 cwt. 2 q. 20 lb. The awards for swedes will be made in due course.

DAIRY.

Western Counties Cheddar Cheese School.

The fifth draft of cheese, weighing nearly 27 cwt., made during the month of August last at the above-named school, carried on at Glendale Farm, near Wedmore, has just been sold to Messrs. Hill Bros., of Evercecech, at 7s. per cwt. of 112 lb.; 3,107 gallons of milk made 3,172 lb. of green cheese, which when weighed at thirteen weeks old weighed 3,008 lb., showing a shrinkage of about 5½ per cent.

The following particulars relating to the manufacture of the cheese will be of interest to cheese makers:—Temperature of milk when received, 84 deg.; acidity of milk when received, 19; temperature of first and second scalds, 88 deg. and 93 deg.; acidity of whey at close of second scald, 16; acidity of whey when vatted, 58; average time when cheese was vatted 3 p.m. A large number of pigs have been fattened at the farm during the time the school has been held there. Instruction in carefully cheese-making is now being given to a full class of students.

CORRESPONDENCE.

The Irish Potato Industry.

SIR,—I was much interested in the letter from Mr. J. F. Williamson in your last issue, giving an account of the way Irish-grown seed potatoes had acquitted themselves in the trial conducted by Messrs. Sutton and Sons, of Reading. Seed potatoes grown in the south of England are put clean out of court, and I think those raised in the West may go with them, judging from the whole and partial failures I have seen this season, and from the figures given on page 441 everything points in the favour of Irish seed. For years Scotch seed has been the one peg on which potato growers have hung their hats, and in spite of the evidence I have no doubt our friends north of the Tweed will find means of returning a verdict of "not proven," but there is no getting away from facts and figures. I was rather amused at the canny suggestion, related by Mr. Williamson, that perhaps the Irish seed was one year's seed from Scotland, and in the western counties of England many growers consider that Scotch seed "does better the second year than the first." With one exception, however, *i.e.*, Ninety-fold—the varieties tested had been grown three and two years in Ireland, and there is no evidence to show that Ninety-fold was grown in Scotland the previous season.

There seems to be no apparent reason why Irish-grown seed potatoes should not be as good, or perhaps better, than those raised in Scotland. Ireland has always been a potato-growing country, and if there is anything in the theory that immature seed potatoes are the best to plant, then the climate of Erin should be admirably adapted for growing them.

Patrick, my friend, you have a chance before you. Experience teaches us that the saving of home-grown seed potatoes for future planting in the south and west of England is an uncertain and very often a disappointing business. We must have frequent changes from Scotland or Ireland, and if the Shamrock can compete with the Thistle in this trade, why shouldn't it? Ah why? There is no apparent reason, but Mr. Williamson concludes his letter by quoting the question raised at the Reading demonstration about Pat having energy enough to kick the ball that rolls at his feet. Let us hope that he will rise to the occasion, and get another potato idea into his head besides Champion. It shows a kindly feeling to keep an old dog, an old horse, or a faithful servant, though they may be worn out so far as work is concerned, but it is foolish to extend this idea to potatoes. Where should we have been now had we stuck to the once unsurpassed potato Magnum Bonum when it commenced to lose its virtue with the same unreasonable tenacity that Pat sticks to his favourite Champion? It is sad to think that Irish potato growers allow their conservatism to stand in the way of getting bigger and better crops of potatoes, while the tenacity with which they stick to the worn-out Champion is largely responsible for the plaintive cries about disease which are continually being wafted across the Channel from "Old Ireland."

November 21, 1906. WEST COUNTRYMAN.

Sales of British Corn.

SIR,—I am much struck with the large falling off in quantities of wheat, barley, and oats sold in the markets making returns for week ending 17th inst., as compared with last year's sown to November 17, viz.:—Wheat, 29,000 qr. less; barley, 42,080 qr. less; oats, 12,000 qr. less; total, 83,080 qr. less on the three grains. This is so very striking that I almost think it may be worth while your calling attention to it in your next MARK LANE EXPRESS.

The falling off in wheat deliveries for the last two weeks proved the crop was anything but the optimistic one spoken of in some quarters, an opinion as you know not accepted.—Yours truly,

W. FOOKES.

Devizes, November 3, 1906.

English Red Clover Seed.

SIR,—This year there is a large crop of English clover seed sown, and fortunately for those farmers who have saved it, there is not a large crop of foreign seed, and taking into consideration the large crop, good prices are obtainable now.

Unfortunately a great many English farmers will not thresh their clover seeds until the spring—the sowing time. This is too late, as the bulk of the trade is always done between now and the early part of the year.

The best and biggest seed merchants must buy early in order to clean and test their seeds, and the export business will not wait for the English seed if it is in the stack; there is always plenty of foreign seed to fill the order.

We feel we cannot too strongly recommend all farmers to thresh and place their clover seed on the market as early as possible now there is a demand for it.—Yours faithfully,

W. H. & L. LE MAY.

London, S.E., November 22, 1906.

Our Powerless Board.

SIR,—May I be allowed to say that Midland fruit growers are very far from being satisfied with Lord Carrington's statement in regard to the American gooseberry mildew. We are free from that destructive pest at present, despite some recent mistaken rumours to the contrary—or so Mr. Salmon tells us—and we are anxious to keep free. Yet all that the Board of Agriculture will do to help us is to send out a circular letter to the dealers who are likely to be importing gooseberry bushes from countries where the blight is rampant. That is not a very heroic measure, and there is a general feeling that the excuse that the Board has no power to do more falls short of being satisfactory.

No one suggests that as things are, the Board can help. But the point is this: A Board of Agriculture which is to be of any real assistance to the country ought not to be left so helpless. Is it consistent with the dignity and authority of a great public department that it should have to descend to begging nurserymen as a favour not to import disease? In such an emergency the board this country needs would have power to command.

How long it takes to rush an emergency Bill through Parliament I do not know. But I am sure of this, that if Earl Carrington were to bring forward a short Bill giving his department power to deal with the danger which has now arisen as everybody knows it should be dealt with, that Bill might become law by general consent in the very minimum time possible.—Yours faithfully,

WEST MIDLAND.

Some Fertiliser Questions.

SIR,—Being a subscriber I notice you offer information. I am grateful for the weekly information you give as to the value of fertilisers and feeding stuffs. But I seek further particulars, which kindly give in your next week's edition. I notice the value of the units of ammonia differ in price.

1. Why is this? Is not ammonia from whatever source obtained of the same value? For example, you quote the ammonia in sulphate of ammonia is now worth 10s. 6d. per unit, but the ammonia in nitrate of soda is worth 13s.

2. Again, I see 9 per cent. ammonia in "fish guano" is quoted at £5 17s. 6d. per ton, which is about 13s. per unit, the same as it is in nitrate of soda; but in sulphate of ammonia it is 2s. 6d. per unit less.

3. What is the present value of "insoluble" phosphates, such as are contained in fish guano, per unit?

So much for inquiries as to fertilisers. May I ask a few questions as to feeding stuffs? I find it impossible to get from merchants any guarantee as to the constituents of cakes. All they will give is "95 per cent. pure." This new Act should remedy this, but I fear it will not, as some plan will be invented to frustrate the intentions of this Act.

(a) What is the average analysis of the usual "cotton" cakes, not decorticated, now being sold. Of course you cannot give only an approximate value without special analysis.

(b) Take the usual "English" made cotton cake. How much "albuminoids," "oil," and "carbohydrates" do they contain?

(c) "Egyptian" seed cotton cakes ditto?

(d) "Bombay" seed cotton cakes ditto?

If you will kindly answer the foregoing questions as an addenda to your weekly quotations as to prices, you will render an enormous assistance to the tenant farmer.

ONE WHO IS TRYING TO LEARN.

November 21, 1906.

Answer: A full reply to these inquiries would occupy considerable space, but we are pleased to answer them as well as we can in the space at our disposal.

1. The cost of the unit of ammonia in different materials is governed, as with other things, by the law of supply and demand. Thus, there is a much larger demand for nitrate of soda than for sulphate of ammonia, and therefore the vendors of the former article are able to get a relatively higher price for the unit in it. If, on the other hand, the demand was more than for sulphate of ammonia, the position would be reversed, and the unit of ammonia sulphate would cost more. The same principle governs the cost of the unit in other materials.

2. There is considerable difference in the in-

trinsic value of the unit for fertilising purposes in different materials. For instance, hair-waste contains about 12 per cent. of units of ammonia, but decomposes so slowly in the soil that it is not worth to the farmer more than about 4s. to 5s. per unit. Shoddy—*i.e.*, waste woolen rags—are largely used in Kent for manuring hops. They decompose more quickly than hair-waste, and are worth 6s. to 7s. per unit. Tannery-waste contains about 4 per cent. of ammonia, but has practically no value as it does not decompose within any reasonable time.

2. The price of fish guano has been continually advancing, in consequence of its scarcity and the active demand for it, especially from French market gardeners, who have a strong predilection for it. The best 9 per cent. quality could not be bought to-day under about £6 15s. per ton. Besides the ammonia it contains about 15 per cent. of phosphate, which is slowly soluble and worth, we should say, about 1s. 3d. per unit. This makes the ammonia cost, as you remark, about 13s. per unit. Fish guano is a good organic manure, and we should be inclined to say, that for market-gardening purposes it is worth the price asked.

3. *Feeding Stuff.*—The average analysis of Undecorticated cotton cake may be put at—

	5 to 6 per cent. of oil,			
23 to 24	albuminoids,			
30 to 35	carbohydrates,			
and the following	are typical analyses of the			
different makes:—				
	Oil.	Albu-	Carbo-	Fibre.
		minoids.	hydrates.	

English make from Egyptian seed	5 to 6	22 5 to 24	32	...	20
Imported Egyptian	5	...	23	...	20
English make from Bombay seed	5.5	...	21	...	22
Imported Bombay	2 to 3	19 to 21	32 to 34	...	28

These analyses are taken from the report of the South-Eastern Agricultural College, with following remarks:—

English cakes are usually made from Egyptian seed. They are soft, contain more albuminoids and less fibre than Bombay cake, and only little free cotton.

Some Egyptian made cakes are also imported: they resemble English makes in composition and are usually a little cheaper.

Bombay seed is less satisfactory for feeding purposes. The cotton apparently cannot be removed from the seed as completely as is the case with Egyptian seed. English cakes are no longer advertised as made from Bombay seed. Imported Bombay cakes, recognisable by their woolly appearance, are, however, on the market, but as a rule they are unfit for stock and may cause injury or even death when fed. They are low in oil and albuminoids, and contain large amounts of fibre. Under the new Act, particulars of which were given in our issue of September 10 last, vendors of cakes will be obliged to state on their invoices the guaranteed percentage of the two principal ingredients—oil and albuminoids, and it will rest with buyers to see that this information is given them, and to get the cakes tested so as to ensure good deliveries.

Bags and Superphosphate.

SIR,—Will you kindly inform me through the columns of your valuable paper upon the following viz.:

I find that the manures (superphosphates) of some manufacturers burn the bags after they have been stored about a month, while the manures of other manufacturers can be stored for an indefinite period without injury to the bags.

Will you kindly inform me why it is the bags are destroyed in the one case, while they are not affected in the other? Thanking you in anticipation, I am, yours truly,

Cefn Llan, nr. Swansea, November 17, 1906.

Answer: All superphosphate has a tendency more or less to rot the bags in which it is packed, and this is especially the case with superphosphate freshly made or to which too much acid has been added. We should say that the cause is usually the first-mentioned, and we would recommend "Forest" to stipulate that the superphosphate supplied to him must be in a thoroughly dry, well-matured condition, not freshly made. If it is in a pasty, damp condition, he should reject it.

As regards books on agricultural matters, he would find Gibson's "Agricultural Chemistry," revised edition, much more complete than the one he mentioned. It is published by George Routledge and Sons, Ltd., Ludgate Hill. Or "Fertilisers and Feeding Stuffs," by Bernard Dyer, is an instructive little work. It costs 1s., and is published by Crosby, Lockwood and Son, Ludgate Hill, London.

Midland Notes.

ALL the winter oats and beans, green crops, and wheat now showing above ground look strong and healthy. For the time keep is abundant, although Nottingham, Northampton, Leicester, and the east and south-east Midlands generally are none too well off for hay, and here and there the new stacks had to be cut into when there was difficulty in keeping up the autumn milk supply. Where sheep have to be bought there are many complaints as to the prices demanded, which seem to preclude almost any possibility of profit.

SPEAKING of sheep reminds one that no one appreciates the cessation of the heavy rains more than the live stock of the farm. Sheep, as we all know, can stand any amount of cold, but like horned stock, they have had a wretched experience these last few weeks, when for days together they have had to suffer the discomforts of soaked fleeces and waterlogged land. Let us hope the effects of these recent hardships may not be too evident when in due course the lambing season arrives.

HERE is a small fact to illustrate the intensity of the drought about harvest time. It was recorded in these notes that bean crops were being left because it was impossible to handle them without wasteful spilling from the parched pods. I hear now of cases in which these spilled beans are coming up as thickly as a regularly sown crop, and here and there it is understood that they are likely to be left and allowed to grow—this on fields destined in the ordinary course for wheat which the season has not permitted to be drilled.

I NOTED last week the enterprise of the Worcestershire County Council in arranging for fruit spraying experiments. The County Educational Committee, through its agricultural department, now sends me an excellent report by Mr. Fred V. Theobald, M.A., on the orchard and fruit plantations of the county, which embodies brief notes on some of the worst diseases observed.

MR. THEOBALD (who is, of course, the well-known vice-principal of the South-Eastern

College) seems to have found few fungus pests; indeed, he notes only ten (the apple scab, canker, and shot-hole fungus of the plum being most general), and observes that these diseases are apparently less serious in Worcestershire than in other fruit-growing districts. But in such a bad year for insect infestations as this has been it is no surprise to find that he discovered over forty different pests of this description.

IT is impossible to calculate the amount of damage that these insect enemies inflict in a bad year. Mr. Theobald goes so far as to reckon that 70 per cent. of the apple crop in Worcestershire has been lost during the past year by the apple sucker or psylla. It seems an incredible proportion, but in some neglected orchards one has seen the entire crop practically swept away by this parasite, which is abundant all up the Teme Valley, in the Vale of Evesham, and along the Severn. One of Mr. Theobald's most practical suggestions is in regard to bisulphide of carbon. Progressive growers are well acquainted with the uses of this evil-smelling liquid in dealing with insect enemies in the soil; but too often they find it almost impossible to buy, and so it must remain, so long as railways, afraid of its inflammability, refuse to carry it. Representations might be made by the county to allow small quantities to be carried on certain trains," says Mr. Theobald. The local Chamber of Agriculture and Fruit-growers' associations might do worse than press the question on the authorities at the Shire Hall.

THE question asked by an Irish M.P. as to the seizure and condemnation of tuberculous pigs in Birmingham is of interest to breeders over a wide area, for Birmingham is a very important centre of the pig trade, and week by week many more swine pass through the city markets than through any others in the Board of Agriculture list. To take one recent week, the Birmingham supplies were over 6,100, though Salford and Manchester combined were the only other market where more than 2,000 were on offer, and no other market had as many as 1,000 to deal with.

WHERE Mr. French went wrong was in assuming that the Board of Agriculture had anything to do with the inspection, which

rests entirely with the local officials. As the local dealers will be found one and all in agreement with his general attitude. Undoubtedly there does prevail a feeling among local traders that the conditions imposed by the Birmingham inspectors are apt to be unduly severe, and that carcasses are condemned in the cases which would be passed elsewhere. Indeed, large as the local sales are, one can learn without much difficulty of dealers who have given up sending pigs to Birmingham, preferring to dispatch to smaller markets, or to trust to local sections. The Birmingham dealers and butchers who adopt Dr. Kitchin's very questionable views and want full liberty to sell any carcass, tuberculous or not, for human food, will not find much sympathy. But both dealers and breeders are disposed to think that if the public is to be safeguarded by a system of close inspection and rigid condemnation, the public ought to pay more for such advantage than it does at present.

November 22, 1906.

Northern Notes.

TO-DAY in Yorkshire the farm servants' carnival begins, the yearly hired man and boys claiming to be at liberty at noon, and day after day hirings will be held for a week in one town or another of East Yorkshire. The custom of standing in the market places, relic of the old days of long ago, is threatened in some quarters with extinction; but threatened men and customs, too—frequently survive for longer periods than one expects. Ever since we were boys the "tate" of the hiring fairs has been hanging, as it were, in the balance. We have never yet heard any plan propounded that could be accepted as an approach to a substitute for the yearly hiring.

THE late Judge Raikes, who covered a wide area in a Yorkshire county-court circuit, used to inveigh against these Martinmas hirings, and he considered it ridiculous that parties should bind themselves to each other for a whole year. His honour's diatribes have made no difference—the system holds on its course, and no serious attempt has up to the present been made to root it out of existence. Opponents of the hiring fairs have an extremely wide field to cover, as it must be remembered the system of engaging nearly all classes of farm servants at such fairs remains in Scotland, the North of England, the North of Ireland, and in a few districts in Wales. In other parts of the United Kingdom the practice is nearly extinct. Can anybody suggest how uniformly in the hiring of unmarried men is to be brought about?

THAT very useful institution, the ploughing match, seems to be losing its hold upon northern rural life. Anything that conduces to the interest in agricultural pursuits should be tenaciously adhered to, and if it is possible to make an indifferent plough-boy into a first-rater, and to make him ambitious to emulate the work of the best man on the farm, then it is something gained, the boy is less likely to be permanently attracted by the glare and glitter and the "fine sights" of the big town.

LABOURERS are not infrequently taken to task in respect of their indifferent hedge-cutting, and one sometimes hears that when our older labourers have died off there are none to follow them half so skilful. This is hardly believable. Nevertheless, nearly all the labourers to be seen trimming and laying quick wood fences are old or elderly men, and how tidily they accomplish their work! Nothing sets off a well-titled field so finely as a nice clean hedge, which has the appearance of having been cut to accurate measurements. A straight eye and an expert hand are the only aids to exactitude which the worker requires.

MANGOLDS have been scoured in an excellent condition, and the root crop generally is working out liberally, save and except an occasional instance of mysterious turnip rot which has set in. The rot appears to be caused by a fungus which penetrates the skin through the median of the turnip "toys." The rot sets in after the tissues below the skin are eaten away. The fungus is in the form of dark spots. It is an old disease, and has apparently no defined name.

AS to the putting or picing of mangolds, one method in vogue around York is to construct the pit in the shape of a man's hip, no matter how wide, and when finished to cover the sides all round with straw and soil, continuing the soil a few inches above the sides and covering in with any kind of rough waste material, even long shavings will do. The top level of local material acts as a ventilator, and the local air rises from the interior of the pit arresting the rot of most, the roots are kept in a sound condition. Baskets pitted

PRODUCE OF CROPS IN GREAT BRITAIN, 1906.

Last week the Board of Agriculture issued the following Preliminary Statement showing the Estimated Total Produce and Yield per Acre of the Principal Crops in Great Britain in the Year 1906, with Comparisons for 1905, and the Average Yield per Acre of the Ten Years 1896-1905:—

CROPS.	Estimated Total Produce.		Acreage.		Average Estimated Yield per Acre.		Average of the ten years.	
	1906.	1905.	1906.	1905.	1906.	1905.	1896-1905.	1906-1905.

The preliminary statement of the produce of hops for 1906, issued on October 10, showed a total estimated produce of 245,688 cwt., being an estimated yield per acre of 5.26 cwt.

MOST EASTERLY NURSERY

As a **FENCING EXPERT AND GROWER** of no small reputation, I should like to attract your attention for a few minutes, provided you are requiring a fence of some description. I have an enormous stock of **HEDGING PLANTS** of all sorts, grown on my Nurseries, on England's Bleakest Coast, which are open to every wind which blows, with a consequence that my large and varied stock is as hardy as it can be, and will thrive anywhere. A **DESCRIPTIVE PAMPHLET** containing **CULTURAL DIRECTIONS FOR HEDGING** and description of **MYROBELLA** and **MYROBELLA PLUM** (for fencing), the wonder of the age, still unrivalled for quickness of growth. It makes a close, thorough, impenetrable fence and is non-injurious to stock. 11-2 ft., 5/; 100, 30/-; 1,000, 2/3 ft., 7/6 100, 50/-; 1,000, 3/4 ft., 10/-; 100, 70/-; 1,000, 2/3 ft., 8/-; 100, 30/-; 1,000, 1 1/2 ft., 6/-; 100, 45/-; 1,000, 11-2 ft., 10/-; 100, 70/-; 1,000, 2/3 ft., 15/-; 100, 100/-; 1,000, **QUICK-THORN**, 1 ft., 2/6 100, 25/-; 1,000, 1 1/2 ft., 5/-; 100, 3/-; 1,000, 2 ft., 7/-; 100, 50/-; 1,000, **LAURELS, BEECH, HOLLY, YEW, &c.**, in all sizes. Prices on application.

STARTLING OFFER.

I will pay carriage on all 5/- and larger orders to your nearest station. Distance or weight is no object.

Send for Catalogue of Fences, Fruit Trees, Shrubs, Roses, Plants, Bulbs, &c.; all sorts and any quantity supplied.

E. GAYE OULTON BROAD LOWESTOFT

NOVA SCOTIA

Offers advantages to British Agriculturists with moderate capital. Improved Farms at Low Rates. Fertile Lands. Famous Fruits. Enormous mineral deposits of Coal, Gold, Silver, Iron, Copper, Lead and Tin. Climate temperate and healthy. Easily accessible to all the principal markets.—Full information supplied by the Agent-General for Nova Scotia, Mr. JOHN HOWARD, 57A, Pall Mall, London, S.W.

FERTILISERS & FEEDING MATERIALS

HY. RICHARDSON & COMPANY, Agricultural Merchants and Manufacturers of Chemical Fertilisers, will be glad to forward favourable quotation on application. Linseed Cakes, Cotton Cakes, Decorticated Cotton Cakes and Meals, and other feeding materials. Basic Slag, various qualities, percentages and fineness guaranteed.

Offices and Works: **Skeldergate Bridge, YORK.**

Stand 170, Smithfield Show.

POTATO SEPARATOR

With Improvements for this Season.

Sorts Potatoes into three sizes and delivers ware into bags.

Simple & easy to work.

COOCH & SON, Commercial St., Northampton.

READERS OF ADVERTISEMENTS

in these pages will greatly oblige and assist us by mentioning

when writing to our Advertisers.

in this way are said to keep a very long time, at least until the summer. The method is labour-saving, and that is an important consideration in these days.

THE grower is very justly complaining of the low price of wheat in local markets, and for the last three weeks a decline of 6d. was noted every seven days, until now the best is not making more than 26s. 6d. Barley, too, is in a bad way, though there is nothing much to complain of as to the general quality. Can one county only grow barley to suit the brewing interest? It would seem that Yorkshire, Durham, and Northumberland are out of the running altogether with Lincoln.

THE materials of which "pure" beer is made are certainly at a discount. We shall soon be sighing for a drop of pure beverage, and then perhaps we may turn our attention to brewing ale for ourselves on the co-operative principle. Why not?

FARMERS are beginning to think about their Christmas sales—we had almost written bills—but these will come later. A lot of good stock in the beef line is in preparation in the stalls. Beef, with the advent of colder weather, which is making itself felt this week, has already hardened in price on an increased demand, reaches the top price at Christmas.

THE fat stock markets begin about the 13th prox., and just follow the Smithfield Show, from whence the prize animals will return to be converted into beef or mutton, the laurels they win enhancing the price by so much per stone.

THE wheat plant has a healthy appearance up North, has braided well from a good tilth. The tenants on high situations who wanted rain badly three weeks ago have had a veritable deluge; lowlands have been flooded, and the fear is that much of the manual value of farmyard dung has found its way into the drain pot and dykes.

THE country has still a fresh aspect, in spite of several sharp visitations of frost, and there is an amount of pasturage of which full advantage might be taken on the grass farms. Tynedisers are cultivating the milk trade to a much greater extent than formerly, and are finding it a more profitable business to sell their milk daily than it was to convert it into butter.

November 23, 1906.

Hiring Fairs.

The first of the two annual hirings, at Wetherby, was held on Thursday, but there was only a poor attendance. Men generally asked more money, and while there were plenty ready to accept situations to look after horses, comparatively few offered their services as cattle men. Farmers were disinclined to give the high wages asked, but a fair amount of hiring took place at intermediate rates. The top wages secured by good all-round men touched £26, but £18 to £24 was the average. Ploughmen obtained £10 to £16, and lads £5 to £10. At Cockermouth on Monday hiring was decidedly slow. There were few experienced men seeking places, but second-class men obtained from £9 to £13; lads from £7 to £9; and boys from £4 to £7.

Darlington November hirings took place on Monday. Men for the half-year got about £12 or £13 for average good hands, but foremen were up to £14; secondary and plough lads, £8 to £9; and young boys, first going out, £5. Female servants got high wages; those for dairy and higher classes of farm work obtained £19 to £22 for the year; ordinary domestics, £14 to £16; younger girls, £9 to £11.

Fertilisers and Feeding Stuffs.

USEFUL INFORMATION FOR FARMERS WHEN BUYING.

Approximate Unit Cost of Fertilising Constituents.

It is necessary for guidance in the economical use of fertilisers, and especially in the purchase of Complete and Special Manures, that the relative unit cost of the principal fertilising constituents should be studied: the subjoined table affords information on the subject. By multiplying the guaranteed minimum percentages of a fertiliser by the unit costs given in the table, the buyer will get a good idea of the commercial value of any chemical manure offered to him. The unit values are subject to variations from time to time, and in this respect we shall endeavour to keep the table up to date, besides which, buyers living in remote districts may have to pay a little more for heavier cost of delivery. If credit is required, this will also add to the cost.

	Law or Equalised.	Peruvian Guano.	Phosphatic.	Dis-solvent (soluble).	Nitrate of Soda.	Sulphate of Ammonia.	Bone Meal.	Super-phosphate.	Basic Slag.	Bone Com-pounds.	Special Man-ures.	Kainit.	Sul-phate of Potash.	Muriate of Potash.
	s. d.	s. d.	s. d.	s. d.	s. d.	s. d.	s. d.	s. d.	s. d.	s. d.	s. d.	s. d.	s. d.	s. d.
Ammonia, organic as in Bones	15 0	12 6	15 0	—	—	10 6	12 6	—	—	15 0	15 0	—	—	—
" in Sulphate of Ammonia	—	—	—	—	—	10 6	—	—	—	—	12 6	—	—	—
" calculated from Nitrogen in Nitrate of Soda	—	—	—	13 0	—	—	—	—	—	—	—	—	—	—
Phosphate soluble in water	2 0	—	2 0	—	—	—	2 0	—	—	2 0	2 0	—	—	—
" assimilable	1 3	1 2	1 3	—	—	—	1 2	—	—	1 3	1 3	—	—	—
" insoluble	—	—	—	—	—	—	—	—	1 3	—	—	—	—	—
Potash (pure)	4 0	4 0	4 0	—	—	—	—	—	—	—	4 0	3 10	4 0	3 1

N.B.—The above table is based on the commercial cost of the fertilising constituents. Agricultural value is not always synonymous with the commercial cost, and every farmer must exercise his judgment, while considering the cost, which fertiliser may be expected to give the most profitable return on his soil and for his crops. This is the cheapest manure for him.

Approximate Unit Cost of the Nutritive Constituents in Feeding Cakes and Meals.

Cakes and other Feeding Stuffs.—In order to be able to form a correct opinion of their value, it is necessary to know the relative cost of the different nutritive constituents. The following note, by an eminent authority, supplies this information. By reference to it, a farmer can calculate out the approximate commercial value of a cake or meal, and then use his judgment as to which is most suitable for his special requirements.

NOTE.—Most authorities in England are agreed that the value of each per cent. or unit of albuminoids and of oil is at least $\frac{2}{3}$ times that of 1 per cent. or unit carbohydrates. If, therefore, the percentages of albuminoids and oil in a feeding stuff be respectively multiplied by $\frac{2}{3}$ and added to the percentage of carbohydrates, the total feeding units contained in the article are obtained. The cost of the feeding stuff divided by this total of feeding units gives the price per unit. Example: A cotton cake contained

	Per cent.	Feeding units.
Albuminoids	22.1	55.2
Oil or fat	3.2	13.0
Carbohydrates	33.2	33.2
Total feeding units		101.4

The price of the cake being £5 7s. 6d., the cost per feeding unit was just about 1s.

Note to Regular Subscribers.

We may remind our readers that we are prepared to analyse free of cost for our regular subscribers, who are farmers, and not in trade as vendors of fertilisers or feeding stuffs, samples of minimum lots of 2 tons of either article, in cases where there is solid reason to suspect an attempt to defraud. The analyses are published, under a *nom de plume*, in the paper.

We are also willing to publish replies in these columns to inquiries relating to the quality and use of fertilisers and feeding stuffs.

Basic Slag.

Buyers of this useful material should bear in mind that various kinds and qualities are offered, and it is advisable to look, not only at the price per ton, but to the percentage of total phosphate, the solubility of the phosphate, and to the fineness of grinding. It happens very often that only the total phosphate is given, and the value of the slag calculated from that percentage; but as different samples of slag vary considerably in solubility, it would be better if the percentage soluble in the recognised 2 per cent. citric acid solution were also taken into account. Basic slag is not soluble in water, but if of good quality, at least 80 per cent. of the total phosphate in the slag should be soluble in citric acid. Some of the slags in the market possess even a greater degree of solubility. The analyst of the Highland and Agricultural Society makes it his regular practice to report the citric solubility of samples of slag submitted to him, and he recommends buyers always to ask for a guarantee of solubility as well as of total phosphate when buying slag.

In the superphosphate trade it has been customary to state the quality as so much total phosphate, of which a stated proportion is soluble in water, thus total phosphates 28 per cent., of which 20 is soluble, so with slag, it would conduce to a better comprehension on the part of the buyer if the seller would state total phosphate and also proportion soluble—thus 40 per cent. total phosphate, of which 32 (80 per cent.) are soluble in 2 per cent. citric acid solution,

Life in Soil.

The soil of a farm is not simply an inert mass of material containing certain mineral substances which plants utilise. It is full of living organisms. Besides the numerous insects, worms, &c., it contains myriads of low organisms, not visible to the naked eye, but capable of examination by the aid of the microscope. They are known as bacteria or micro-organisms, and are so minute that a grain may contain many thousands, increasing and propagating under favourable conditions with incredible rapidity. The "Farmers' Handbook" makes some interesting observations on the subject. These bacteria exist in soils chiefly in the upper layer; a pinch of soil may contain from several thousands to several millions; loamy soils and soils containing much organic matter contain most, sandy soils contain least. The number decreases gradually from the surface soil downwards till about 3 ft., where few or none are present.

Each different kind of bacterium performs its own useful purpose in nature, but in the interest of economical cultivation it would appear that the growth of some of them have to be encouraged and the development of others to be checked. The subject, however, is not at present clearly understood, and has to be further investigated by scientific men; for us the practical knowledge is that organic matter, increasing the supply of humus to the soil, has been proved to favour the rapid growth of the kind of bacteria which convert organic ammonia into nitrates, suitable for assimilation by the crops. We have, therefore, to see that we keep up in the soil by application of farmyard manure, the ploughing under of green crops and other suitable means, a sufficient supply of humus.

Fertiliser Material Imported in October.

	Quantity.	Value.
	1906.	1905.
	1906.	1905.
Bones	4,636	6,117
Guano	4,263	3,563
Nitrate of soda	10,193	12,000
Phosphate rock	20,297	33,348

Nitrogen Germs.

"The United States Department of Agriculture have issued a special circular to the effect that the extravagant and misleading claims contained in some of the advertising matter now appearing in regard to inoculating material for legumes make it necessary again to call attention to the limitations of the value of inoculation. Summarised from Department bulletins, they may be stated as follows:—

"No beneficial results can be expected for a particular crop if the bacteria for that crop are already present in the soil.

"But little, if any, benefit can be expected from the use of these bacteria if the ground is decidedly in need of other fertilisers, such as phosphates, potash, or lime.

"But little, if any, benefit can be expected from inoculation if the soil is already rich in nitrogen.

"A recent examination of samples of cultures for inoculating legumes obtained through various seed firms throughout the United States indicates that there has been a slight improvement in the general character of these cultures."

Potato Cultivation.

Does it pay better to apply a smaller dressing of farmyard manure together with artificial, or to put on a large dressing of farmyard manure alone?

To test the relative advantage of the above alternatives, the following experiment was made last season. On

Plot A were applied 20 loads of farmyard manure.

Plot B were applied 10 loads farmyard manure, 3 cwt. superphosphate, and $\frac{1}{2}$ cwt. nitrate of soda.

The result was that A plot yielded at the rate per acre of 9 tons 9 cwt. and B plot 10 tons, the value of increase over unmanured plot being for A £1 9s. and for B £8 18s. 3d., thus demonstrating once more that a small dressing of farmyard manure supplemented by artificial is the more profitable system.

Let us always bear in mind that with crops, as well as with animals, it is possible by careful selection, combined with careful treatment, to improve them and cause them to give us more food and the increased pleasure which comes from success.

Manuring of Seeds Hay.

From a series of trials made in the Midlands under the supervision of the Midland Agricultural College on soils varying from a light loam to a stony clay, it would appear that the highest and most profitable yield was obtained by the use of 1½ cwt. of nitrate of soda and 2 cwt. of superphosphate, which left a net profit of 11s. 9d. to the good. Last year the same dressing also gave more profit than other artificials tried against it, the profit then being 17s. 6d. per acre.

The artificials were sown in March and April. Sulphate of ammonia was not especially tested against nitrate of soda, but from the relative results of some of the other experiments the conclusion is drawn that sulphate of ammonia and superphosphate would have done as well as nitrate and super.

The addition of potash whether as sulphate, muriate, or kainit, was not accompanied by any increase in crop, but it is considered desirable to point out that this disappointing result may have been due to the late application of the salts. It cannot be too often impressed on farmers that potash salts, especially kainit, should be applied quite early, and produce the best results when put in the soil in late autumn or winter.

Common salt was also tried, but proved disappointing.

The summary of the results is said to be—

1. That the seeds lay crop can be in the average case, be profitably increased by the use of artificial manure.
2. That the most profitable return was obtained by the application of 1½ cwt. nitrate of soda and 2 cwt. superphosphate per acre.
3. That there is a strong probability that sulphate of ammonia, in place of nitrate of soda in the above dressing, would do equally well.
4. That potash salts did not give an increase in the crop. (This is subject to above remarks.)
5. That the use of common salt reduces the yield.

Makbar Cattle Food: Appeal Dismissed.

The hearing of the appeal of Barmak (Ltd.), cattle food makers, of Pryme Street Mills, Manchester, against the fine inflicted by the Kirkham Justices, was recently concluded at the Lancashire Quarter Sessions at Preston. The conviction was on the ground that appellants caused a description of their cattle food "Makbar" to be false in material particulars to the prejudice of the purchaser.

Respondents held that the statement in the pamphlet issued by the company that "Makbar" was composed of the "finest meals, cane sugar, and hop seed," and that 2lb. of "Makbar" was equal to 3lb. of any other feeding stuff was incorrect. They produced the certificate of Mr. Collingwood Williams, which stated that the sample he had analysed consisted of about equal parts of molasses and vegetable refuse, including spent hops, offal of wheat, and other seeds and husks.

Appellants claimed that the circular was correct and that spent hops formed a valuable cattle food hitherto unknown.

Having heard the evidence for the appellants, the Bench retired for a considerable time, after which

Mr. Worsley Taylor, K.C. (chairman), said it had been proved that "Makbar" consisted of 54 per cent. of molasses, and witnesses agreed that molasses was of considerably less value than cane sugar. Appellants contended that, applied to cattle food, cane sugar meant cane sugar molasses, and distinguished it from beet sugar molasses. The witnesses could suggest no reason why it had not been called molasses. The Bench were of opinion that to the mind of the ordinary purchaser cane sugar and not molasses was understood, and therefore the description was false within the meaning of the Act, and in material particulars to the prejudice of the purchaser. Appellants contended it was not to the prejudice of the purchaser, as he had had a visit to the works, and was shown the processes of manufacture. It was contended he ordered a food similar to that he saw made. Cummings stated, however, that he ordered the food according to the circular. When at the works he was told it was cane sugar in a liquid state. It was residual cane sugar, the manager said. The Bench were of opinion that that contention failed in fact.

Mr. Bather, for appellants, asked for a case to be stated on the point that Cummings himself was not prejudiced as a purchaser.

The chairman said they had found against appellants on that point. It was an absolute fact, without a shadow of doubt, it was not arguable, and he should be wrong to state a case on that point.—The appeal was dismissed with costs.

Definitions of Soil Fertility.

A paper by Prof. W. H. Jordan (Agri. of Mass., 1904) discusses the various theories of soil fertility, particularly those advanced in Bulletin 22 of the Bureau of Soils of the U.S. Agricultural Depart-

ment. The author's views with reference to methods of soil management necessary to maintain fertility are summarised as follows:—

"1. Thorough tillage, with efficient machinery, to be given if possible when the moisture conditions of the soil admit of satisfactory pulverisation."

"2. Frequent surface tillage at times of scanty rainfall, in order to conserve the supply of soil moisture."

"3. A sufficiently rapid rotation of crops to insure good soil texture, to allow the necessary frequency of applying fertilising material, and as a main result to secure a paying stand of crops."

"4. The introduction into the soil at frequent intervals of an amount of organic matter necessary to prop soil texture and water-holding power, either by application of farm manures, by ploughing under soiling crops, or by the rotting of the turf."

"5. The scrupulous saving of all the excrement of farm animals, both solid and liquid."

"6. The purchase of plant food with due reference to the needs of the farm and to the system of farm management prevailing."

"7. The maintenance in the soil of those conditions of drainage and aeration which promote the growth of desirable soil organisms and the introduction into the soil, when necessary, of such organisms as are essential to the growth of particular plants."

Consumption of Mineral Fertilisers in India.

As the result of recent investigations, the Government of India has been recommended to take action on the question of consumption of mineral fertilisers in India, and that the Agricultural Departments should experiment with the principal mineral fertilisers. Special attention is to be paid to the trial of sulphate of ammonia in sugar cane cultivation. It is understood that ammonium sulphate will shortly be manufactured in India, and arrangements are well advanced for the erection of by-product recovery ovens in coke making. Various manufacturing projects are being contemplated by which the output of ammonium sulphate and sulphuric acid will be increased and utilised for local requirements.

Phosphatic manures, mostly in the form of crushed bones and superphosphates, have been under trial, and the results of trials at Camwore during sixteen years give the following average yield in pounds per acre:—

	Maize.	Wheat.
	lb.	lb.
Unmanured	760	1,193
Sulphate and bone dust ...	1,280	1,697
Sulphate and superphosphate	1,194	1,718

The general result of experiments has been that bone phosphate has not given any large increased yield of cereals except in the Ganges alluvium of Lower Bengal. Phosphoric acid is not generally deficient in Indian soils, except in Behar and Assam. It seems improbable that superphosphate, at its present price, will come into general use, and in most parts of India the soil responds more readily to nitrogenous conditions. The enormous export of bones yearly (100,000 tons) means that in course of time this drain must be replaced, and the nitrogenous manures will be supplemented by phosphates. The establishment of a sulphuric acid industry in India would favour the use of phosphatic manures by the cheapness in price that would result from local manufacture. Phosphates occur in the form of apatite as a by-product of the mica mines of Chota Nagpur, and phosphatic nodules occur in large quantities at or near the surface in Trichinopoly. The phosphate of lime found in Christmas Island, and which is shipped to Japan, Australia, and Europe, can be landed in bulk in Calcutta at about £2 10s. per ton. If a sulphuric acid industry could be established, Christmas Island phosphate might be less costly than any indigenous material. The analysis of these materials shows:—

Constituent.	Percentage of Different Constituents.		
	Apatite.	Trichinopoly Phosphate.	Christmas Island Phosphate.
Molature	0.37	1.62	0.74
Organic matter ..		2.71	2.89
Lime	30.43	37.22	2.01
Iron and alumina ..	1.80	11.50	
Alkalies, &c. ..	3.01	7.76	
Phosphoric Acid ..	23.29	22.83	38.89
Carbonic Acid ..	0.03	5.53	1.95
Silica	22.90	10.20	0.10
Calcium phosphate ..	61.98	49.84	84.90
Calcium carbonate ..		2.63	1.30

Gypsum is found in large quantities in the Salt Range of Northern India, and it is an antidote to certain classes of saline soils. No definite results have been obtained from nitrate of soda, and sulphate of ammonia deserves more trial in India than it has received. The use of artificial fertilisers seems to be coming within the scope of Indian agriculture, and the establishment of a sulphuric acid industry might have important

results. Cotton is to be treated with various manures, including superphosphate and sulphate of ammonia, also sugar cane and other valuable irrigated crops. When fertilisers come into general use the question of guarantee of quality will become of importance.—*Chemical Trade Journal.*

Testing Vitality of Seeds.

Many of our readers will be now arranging for their supply of seeds for next season's crops, and we venture, therefore, to call attention to the necessity of buyers making sure that their supply of seeds are of good vitality and free from weeds.

A simple test of the vitality of any farm or garden seeds can be made as follows:—Place 100 seeds, taken at random from a sample, on a dish of sand, cover from half to one inch with sand, moisten and keep in a warm place, as behind a kitchen stove, until the sprouts appear. The number of sprouts which appear will give an idea of the percentage which may be expected to grow. It is advisable to make more than one test and be guided by the average results. A test of this kind is considered more trustworthy than one in which the seeds are placed in blotting paper.

Soil Fertility—Law of Minimum.

The law of minimum was propounded by the celebrated Liebig, and is accepted as an axiom of soil fertility. Every soil contains a maximum of one or more and a minimum of one or more of the ingredients necessary for plant growth. Now the growth or produce of a plant is governed not by the total combined quantity of all the ingredients present in the soil, but by the producing power of the essential ingredient present in the smallest proportion, no matter how small a part this deficient ingredient may play in the economy of the crop. This is easily understood on the principle that the strength of a chain is governed by its weakest link.

Thus the object of applying fertilisers is to provide against any such deficiency, and to furnish the crop with a full supply of readily available well-balanced plant food.

Prices of Fertilisers.

As the season for the purchase of fertilisers is now at hand, we shall give weekly for the next few months the London prices of the principal articles.

	£ s. d.
Nitrate of soda prompt delivery	11 12 0
" " " " " " forward ..	12 2 6
Sulphate of ammonia	12 15 0
Superphosphate, 26 per cent.	2 10 0
" " " " " " 35	3 6 3
Pure dissolved bones	5 7 6
Bone compound, ordinary	3 8 9
Ground hoofs, 15 per cent.	9 10 0
Fish guano, first quality, scarce & dear	6 12 6
Ditto, second quality	5 7 6
Kainit	2 5 0
Sulphate of potash	10 0 0
Muriate of potash	9 0 0
Basic slag, 39 per cent. (ex works, Mid-	
lands)	1 13 0
Ditto, 38 per cent.	2 3 0

Nature's Methods.

Nature's mode of manuring and preserving fertility of soil is by spreading nearly everything on the surface, and Nature, in most cases, is a safe guide. Leaves in forests and grass and weeds of prairies and fields are deposited on the surface from year to year, preserving fertility and causing giant trees to grow. Besides, plentiful mulching preserves nitrogen and moisture about the plants, as well as scouring from the bad effects of too much sun heat, and in winter secures crops from much injury by freezing and leaving out or being blown there by spring winds.

Cabbage Cultivation.

In a report of some experiments in cabbage growing, it is stated that, contrary to the general notion concerning the treatment of "leggy" plants, it was found that depth of setting had very little influence upon the size of the heads. Plants handled three or four times invariably gave better results than those handled once or twice before transfer to the field. Frequent transplanting increased the average size of the heads. Handling the plants in pots before setting in the field increased the percentage of marketable heads; but trimming the plants at the time of setting appeared to be of no special importance. The practice of mulching instead of cultivating was found to give very satisfactory results.

Gas lime, unless submitted for some time to the action of the atmosphere, exercises a bad effect in checking nitrification in the soil, owing to the poisonous sulphur compounds it contains. This is a good time to spread gas lime over arable land intended for next spring sowing.

Registered **"LIMPHOS"** Trade Mark.

THE NEW PHOSPHATIC FERTILIZER,

Combining (with low price) the advantages of Superphosphate, Basic Slag, and Basic Superphosphate.

Guaranteed to contain 40/45 % Phosphates and 35/38 % Lime.

The Phosphates are readily soluble, being guaranteed 28 units soluble in Hughes' Standard Citric Acid Solution (1 in 1,000), of which not less than 10 units are guaranteed soluble in water.

BIBBY'S "CREAM EQUIVALENT" MEAL

FOR
CALF-REARING.

Our Agents are continually hearing some such remarks as: "I want you to send me two more bags of that 'Cream Equivalent' Meal. It is fine stuff, and I should like you to see my weanling calves; they are a splendid lot—a perfect show."

We like to hear talk like this, and do not wish for a better advertisement of this Meal than these "Cream Equivalent" reared calves are all over the country.

It is quite easy to prepare. It swells out into a fine creamy substance, the calves are fond of it, and there is no scour.

When the calves begin to eat, we recommend a little dry feeding—a mixture of "Bibby" Cake, Oats and Bran is particularly suitable, the former being at once nutritious and digestible; and calves so reared are always one of the sights of the farm, and make fine well-grown heifers with nice loose skins and plenty of good hair.

One cwt., costing 15/-, carriage paid, is enough for two calves. It costs about 1/3 more to rear a calf on "Cream Equivalent" than on the cheaper calf foods, while the difference in value of the grown animal is most marked, both as to condition, health, and growth.

It is the most soluble Calf Meal on the market, and can be made up simply by soaking the meal in cold water for six or seven hours, if this suits the feeder's convenience better than by making up with boiling water in the ordinary way.

If you are interested in this subject, write for our new circular, "How to Rear Calves for the Dairy." It will be sent free of cost to any address on receipt of postcard.

THE CHRISTMAS FAT STOCK SEASON.

November at its close has in train the natural harbingers of the Christmas festive season, fat stock shows. Norwich opened the ball last Thursday with an admirable display alike of the bovine, ovian, and porcine breeds, and our next week's issue will contain a report of the Bingley Hall Exhibition, and then in the week following will come the world-renowned Smithfield Club carnival. Sometimes the animals which receive highest honours at Norwich, repeat their triumphs at Birmingham and Islington, but in regard to cattle this is not always the case. Sometimes beautiful specimens of the Aberdeen-Angus silk, or massive heavy-fleshed blue-grey cross-breeds, swoop down like eagles from the North after winning at Edinburgh, to carry off the best prizes of Smithfield. Owing to the Edinburgh Show being held coincident with Birmingham, they seldom appear in the competitions of the South until the best of the best of all breeds are gathered together in the Royal Agricultural Hall, Islington.

The fattened beoves of the Royal herds are often found hard to beat at Norwich, Birming-

ham, and London shows. The Shorthorn, Hereford, and Devon ones of the Windsor Park Farms and the Sandringham one all contain some of the best strains of blood ever produced, the virtue of which gets abundantly evident, not only by imparting symmetry and grand character, but in causing the richest of flesh to be laid on when the steers and heifers are fed for the block. Like produces like in this as much as in any other characteristic of animal perfection—early maturity, high quality flesh, and the property of laying it on evenly.

Sandringham being in Norfolk the cattle were from that herd with which the King won two first and three second prizes. The cracks of Mr. Learner and Mr. Hudson have therefore yet to fight the Royal outcomes from the Windsor herds as well as the leading prize-winners of Edinburgh. Moreover, the winning at Norwich appears to have been very close work, especially in the competitions in which Mr. Learner's heifer, bred by Mr. John Ross, of Meikie Tarrel, figured. She was only second to Mr. R. W. Hudson's Honey Bee last year at the Smithfield Club Show, and it was a very critical point to determine which was the better of the two at Norwich. Then after being placed first in her class she had to meet Mr. Hudson's first prize Aberdeen-Angus steer Danesfield Negro, which was first as a yearling both at Birmingham and Islington last year. These animals, together with Great Scot and Waddesdon Prince, the first and second two year steers of Mr. Turner and Miss Alice de Rothschild, are of great merit, whether they hold their own or not when Greek meet Greek at the future contests.

Norwich, at any rate, has led off well with its thirtieth Christmas exhibition, rendered all the more attractive by the Royal Southdown sheep from Sandringham, which won two first and three special prizes.

THE GROUND GAME ACT.

This modest little Act has no connection with the Land Tenure Bill, otherwise it would not have found its way so easily through Parliament, almost unobserved in the turmoil and confusion accompanying the progress of more ambitious measures.

It will be remembered that the Ground Game Act, 1880, whilst conferring on occupiers of lands, as incident to and inseparable from the land, the right to kill and take ground game thereon, limited the exercise of the right in the case of moorlands and uninclosed lands (not being arable lands), to the period from December 11 in one year until March 31 in the next year, both inclusive; subject, however, to an exception in favour of detached portions of moorlands or uninclosed lands adjoining arable lands, where such detached portions are less than twenty-five acres in extent.

This very limited right over moorlands (designed no doubt to prevent the disturbance of winged game) has been felt to be a hardship by tenants of open lands, and the new Act has been passed with a view of alleviating the hardship. It provides that the occupier of such lands shall be entitled after April 1 next to exercise the right of killing and taking ground game (otherwise than by the use of firearms) during the further period from September 1 to December 10 in every year, both inclusive.

It will be noticed, however, that during this extended period the use of firearms is prohibited (where the only right is that conferred by the Act) and the shooting tenant is thus amply protected, the use of firearms being still limited to the period from December 11 to March 31.

Under the 3rd section of the Act of 1880, every agreement, condition, or arrangement which purports to divest or alienate the right of the occupier as declared, given, and reserved to him by the Act, or which gives him any advantage in consideration of his forbearing to exercise such right, or impose upon him any disadvantage in consequence of his exercising such right, is made null and void. But the Act of 1906 provides that the section just quoted shall not apply to prevent the owner and occupier of moorlands or uninclosed lands from making and enforcing agreements for the joint exercise, or the exercise for their joint benefit, of the right to kill and take ground game between September 1 and December 10 in any or every year.

The Act will probably be welcomed by occupiers of open lands in so far as it will enable them to trap rabbits on such lands

earlier than the law has hitherto allowed, but it does not touch one grievance, which is a crying one in many parts of the country. The Act of 1880 stipulates that a person shall not be deemed to be an occupier of land for the purposes of the Act by reason of his having a right of common over such lands; or by reason of an occupation for the purposes of grazing or pasturage of sheep, cattle, or horses for not more than nine months. There are many manors in which the freeholders have common rights of pasture over extensive moors and commons, as appendant or appurtenant to their freeholds. These common rights are often of considerable value, but their value is apt to be prejudiced by the depredations of rabbits.

The policy of the Ground Game Acts is to give farmers a summary remedy for damage to their crops by ground game. The commoners are, in fact, the farmers of the unenclosed land and moorlands, which the Act says they are not to be "deemed" to occupy; and a hard time they often have to make ends meet. Why should they be denied the privilege of taking the rabbits which abound on the commons, and often do considerable damage, although such rabbits are themselves a valuable product of the soil? It is as much to the interest of the commoners to make a few shillings out of the rabbits, as it is to farmers of enclosed land to put money in their pockets, indirectly, by killing ground game to save their crops.

Notes of the Week.

The first of the important fat cattle shows of the season, the Norwich Christmas Show, attracted a large number of visitors, not only from East Anglia, but from more remote districts.

For the purpose of these Christmas shows, the word fat cattle includes pigs, sheep, and poultry.

The weather during the Norwich Show week was too warm to be seasonable, but it was pleasant and brightened with a touch of sunshine.

The ancient city was decorated in an attractive manner to welcome its many visitors, who filled the streets with bustle and excitement.

About the show itself, there was nothing to be especially noted; it was "much of a muchness" with previous shows.

There were some splendid animals, a credit to the exhibitors and objects of admiration to the visitors.

The President of the Board of Agriculture evinced his interest in the show by being present. For the occasion he was the guest of the previous Minister of Agriculture, the Right Hon. Ailwyn E. Fellows.

Earl Carrington afterwards paid a visit to the Marine Laboratory at Lowestoft. As President of the Board of Agriculture and Fisheries, he takes great interest in the steps being taken to increase the harvest gathered from the sea.

Invisible margarine! For ways that are dark, some of our grocers can compete with the heathen Chinee. We have heard of a grocer who, to comply with the law, has the word margarine printed in large letters on notices in front of the stuff, but it is printed in chemical ink, which, while apparent by day, becomes invisible by gaslight. Be watchful, oh ye food inspectors!

The continued rain is justifying the proverbial privilege of an Englishman to grumble. We are anxiously looking for a change to bright, dry, seasonable weather.

The advent of the important Fat Stock shows is a reminder of the near approach of the festive season. There is every prospect of the shows being unusually successful.

Professor Sec has discovered a new natural law, by virtue of which he predicts that the future of the sun's activity will be three times as great as in the past. At this period of the year it is a comfortable reflection.

The adoption of dust palliatives on the roads is going to be an expensive affair. The surveyor to the Lancashire County Council estimates that it would cost the county £57,000 a year for only the main and secondary roads.

Who is to bear this extra heavy expenditure? Motors are the cause, dust the effect; *ergo*, motors should bear the brunt.

Calcium chloride is a useful chemical to apply to the roads for dust-laying, but it is a chemical which acts very injuriously on leather. At one place the men engaged in applying the chemical had the boots destroyed, and were granted a gratuity of 10s. apiece.

Will the Land Tenure Bill arrest the continued fall in the value of land? A striking example of this depreciation was lately furnished at an auction sale at Thurlby, Lincolnshire.

Three fields were sold for £836. Thirty years ago the same property realised £1,800—about £1,000 absolutely lost.

What is the proper pronunciation of the word tomato. There is a couplet:—

"If tomato is tomato,
Then potato is potato."

Both words come to us through the Spanish. Tomato from *tomata*, meaning, "Take thou it," said to have been used by Adam to Eve when he handed her the love apple.

In America tomatoes are still called "love apples," although they are really not a fruit but a vegetable.

About a million and a-half tons of food enter London every year by way of the Thames, and it is supposed to be subjected to examination.

But the staff engaged in this operation is not large enough to attend to it properly. The poor of London must eat some strange food.

An eminent physician made the remark the other day that all the efforts now being made to cure and stamp out human tuberculosis are fruitless, until people have pure sources of meat and milk.

People in Germany are getting anxious about the relative decrease in the number of cattle in the empire. Ten years ago there were thirty-five head of cattle and twenty sheep for every 100 people.

These numbers have now fallen to thirty-two cattle and thirteen sheep per 100 inhabitants, and as a consequence the price of meat has risen about thirty-eight per cent.

Population throughout the world seems to be gradually increasing beyond the available supplies of food, a fact which must lead to a higher level of prices for food products.

According to returns furnished to the Board of Trade, the average cash earnings for harvest work per man this season was 47 8s. 6d. in the Eastern Counties and 44 9s. 4d. in the South-West Counties.

This is a great difference, and an explanation of the cause would be interesting. A Labour Bureau would be useful, if it helped to a more even supply of labour.

26,000 bales of wool were recently sold in one day by auction in Adelaide. This affords an idea of the magnitude of the wool trade.

There was brisk bidding and keen competition. Prospects are assuredly good for producers of wool.

North Lincolnshire farmers have lately again suffered severely from the depredations of stray dogs, and a very bad case of sheep worrying has occurred at the farm of Mrs. Newmarsh, Scartho, near Grimsby. A small flock of ewe lambs was on Monday evening left safely in a field, but next morning the shepherd found eight lambs lying dead, and nine others lying bleeding in a corner of the field. Four of these were so badly injured that they had to be slaughtered, though it is hoped the other five will recover. The animals were worth £50.

FRIDAY, NOVEMBER 30.—Chippenhams Agricultural Show, second day—Cattle Fairs at Pontefract, Maidenhead, and Amphil.

SATURDAY, DECEMBER 1.—Birmingham Fat Stock Show, first day—Rotherham Horse and Cattle Fair—Buckingham Cattle and Sheep Fair—Bury St. Edmunds Agricultural Fair.

MONDAY, DECEMBER 3.—Burgham Fat Stock Show, second day—Tonbridge Fat Stock Show, first day—Talgarth, Rotherham, York, and Crewe Fairs.

TUESDAY, DECEMBER 4.—Birmingham Fat Stock Show, third day—Tonbridge Fat Stock Show, second day—Chichester Fat Stock Show, first day—York Fat Stock Show, first day—Derby Horse Sale—Derby Cheese Fair—Lambourne, Wells, Stafford, Witney, Bantwich, Birkenhead, and Cordridge Fairs—Acceptances for the Farmers Club dinner of the 11th and for the dinner in honour of Major Chigley of the 12th, should be sent in a week beforehand in order that the Honorary Secretaries may make proper seating and other arrangements.

AGRICULTURAL LAW.

Advice of a Legal character is offered to Readers entirely free of charge. Particulars of cases should be addressed to the Editor, "MARK LANE EXPRESS," 3, Wellington Street, Strand, London, W.C.

Motors for Hilly Work—Action by a Farmer.

In the King's Bench Division on Wednesday the case of Studd v. The Ivel Agricultural Motors came before Mr. Justice Jelf and a common jury. It was an action by Mr. Edward Fairfax Studd, a gentleman farmer, of Oxted, Devon, who sued the defendants for the return of £308 13s. 9d. paid for eighteen horse-power agricultural motor, and the rescinding of the contract, and damages for misrepresentation.

The plaintiff's case was that in February, 1903, he received a circular from defendants describing the merits of a motor which they said was capable of doing any kind of agricultural work, and which it was said could also be used as a traction engine. Further, it was stated that the cost of the upkeep was exceptionally small, and the cost of fuel only about 8d. per acre. Plaintiff went to see the machine doing agricultural work at Hilthorpe, in Norfolk, in a comparatively flat field, where it was driving a three-furrow plough, and seemed to be working satisfactorily. Plaintiff interviewed the defendants' manager, Mr. Hoffman, and said he wanted a motor that would work on a hilly farm. Mr. Hoffman assured plaintiff that the motor would work as well in a hilly field as on the level, and that it would, in fact, work anywhere that horses could work. Plaintiff gave Hoffman an order for a motor, to cost £308 13s. 9d. Plaintiff's son went through a course of instruction and the motor was delivered. It was alleged that it was a failure from the first, for when tried with a scuffle in a field with an incline of about one in eight, it reared up and refused to go. People were sent from the defendants' to set the machine right, but it was of no use.

The defendants, whose place of business is in Marlborough Street, London, denied that they made any misrepresentations, or that Mr. Hoffman guaranteed the motor to work as well on a hilly farm as on the level. They denied liability, and counter-claimed £3 add for extras supplied. Mr. Duke, K.C., and Mr. Haldenstin appeared for plaintiff; Mr. J. C. Graham, K.C., and Mr. W. Dodd for defendants. The plaintiff gave evidence in support of his case, after which the hearing was adjourned.

At the meeting of the Tunbridge Wells Farmers' Club, Mr. W. Troy, Crowborough, presided, and spoke of his visit to the United States and the farming conditions prevailing there. He gave interesting observations upon agricultural differences between the States and this country, and the matter is to be again discussed by the members.

Notes and Jottings.

HAVE you begun to get some of your roots up so that if frost comes you will not have all of them frozen in the ground? The soil is very wet, and will freeze hard with a slight frost, and the roots will be frozen too. It makes for unsatisfactory sheep-breeding when all the root crop is frozen in. Pecking up frozen shells of turnips to be eaten frozen by chilly sheep is cold comfort to farmer or sheep. It is not suggestive of frost when the temperature is at 50 deg. Fahr., but our climate has vagaries, and nothing seems to please it better than diving from 50 deg. down to 20 deg. or 30 deg. at one attempt. It is quite capable of doing it at this season. Men have left skating in the country to go up to the Cattle Show.

THOSE unaccustomed to sheep rarely seem able to distinguish one sheep from another unless one has a black face and one a white one. Very considerable astonishment has been expressed at times a shepherd should not only know his own sheep, but know each one individually. This seems strange to the farmer when he goes to draw out a pen for the market and wants to make them match, he finds difficulty in getting them sufficiently matelching.

EVEN at shows when animals have been drawn from flocks where years have been devoted to getting the flock true to a type, there are very few pure, even of three, which closely match, and even in the best matching lots each one differs from his mates. There is no doubt about the attractiveness of a pen that shows great similarity.

THE breed of the golden hoof is frequently extolled, and rightly too; but the golden hoof has a way of churning up the soil and making

it into a very bad seed bed for the following crop. In a wet time considerable care is needed to provide sufficient fall back for the sheep, both in the interest of the soil and the sheep. Too closely folded the ground is soon churned up, the sheep stand hock deep in the slush, so that the blood passing down the legs is rapidly chilled and goes back in a cold condition to the heart and lungs, causing distress to those important organs, leaving the animals in a condition ready to take up ailments. Moreover, it may be so wet that they cannot lie down. I have more than once seen hungry sheep which, through the wetness of the land, have been unable to lie down, turned into a fresh piece of feed and at once drop down, and merely eat the turnips within their reach—the desire for rest overcoming the craving of the appetite. The fall back should always be sufficient to avoid this, no matter how much may be required to effect it.

THE difficulty in finding barleys of the very highest quality is greater now than it was before so much cake and corn was given to sheep on roots. The land becomes too rich, and a rank growth results, which is inimical to the growth of the finest skinned barleys. The matter is intensified by uneven feeding; so far as possible the feeding should be equal in all parts of the field, and the folding regulated to insure it. This is not always regarded; the consequence is that the individual pens may be seen in the subsequent crop, marked out in squares of different colour and strength. It is impossible in these circumstances to get a uniform sample, and uniformity is the first essential in a barley sample. It has to be remembered that the profit of sheep feeding lies greatly in the manuring resulting therefrom, and if the manuring is uneven there is a preventable loss.

A MOST common cause of uneven manuring is the want of regularity in moving the feeding troughs; and shepherds whose first thought is their sheep, are very liable to be careless of the subsequent crop; therefore the constant attention of the muster is required to see that troughs are moved regularly. Manuring is less even where shelter cloths or closely wattled hurdles are used than where open slatted hurdles are employed, for the sheep naturally get behind them for shelter which the open hurdles do not provide. But the shelter provided is better for the sheep.

THIS extraordinary season, with its absence of frost, has peculiar bearing on sheep keeping.

November has been what September often is, and in some ways October has not counted. In very few places has there been sufficient frost to check the liver fluke, and pastures generally safe by reason of frost in mid October, are yet dangerous.

AFTER such a dry year in many parts fluke seemed to be very unlikely, but it would be well to keep a close watch on sheep to a later period than that at which it generally develops it. This is particularly necessary in places where there has been standing water. Where there is any reason to fear liver rot, generous feeding should be provided so that the sheep may maintain strength to resist the progress of the attack. Salt should be liberally supplied, as it doubtless has a hindering effect on the fluke. When once fluke has reached the stage of emaciation, when the eye shows it, there is no known remedy; therefore, preventive means are the best.

YARD feeding in winter time is not much followed in this country, although at one time there was a considerable amount of it done, and at one time a great deal was written in favour of the subject. Of course the great drawback to it is the drawing of the food to a special place, and the necessity of carting back the manure to the land, which is well distributed by the sheep when folded out in the ordinary manner.

IN ordinary circumstances feeding on pastures where the land is too wet and heavy provides sufficiently favourable conditions for sheep to thrive in, but the manure is frequently required on the arable land. As a matter of fact, there is little pasture land which does not respond satisfactorily and profitably as a result of the feeding, and there is no better way of improving a pasture.

MORE Southdowns, in relation to the number kept, are yard-fed than any other breed, and the sheep do well. The breed does not do well on cold, wet lair as on clay land in winter, and the more artificial conditions agree with it. On drier land, and in places little exposed, they winter well out of doors. However, the fattening is often carried on away from the chalk soils.

Dublin Wool Sales.

At Messrs. Ganly's autumn sale of wool, held on Thursday in the Usher's Quay Wareroom, there was only a moderate attendance of buyers, including home merchants and manufacturers;

SOUTH DEVON RAM.

At the Royal Show this year at Derby, this Ram won the First Prize in the class for South Devon Rams, Shearling and upwards. He is the property of Mr. John Stooke, of Sherford, but was bred by Mr. John S. Hallett, of Sherford, Brixton, Plymouth, and was born February 14th, 1904.

together with a few representatives from English centres. The biddings for all classes showed a great lack of animation, but the prices realised showed some slight improvement on recent quotations, although about 1d. per lb. less than the figures made at the August sale. There were 350,000 lb. of the different descriptions catalogued, but many of the lots had to be withdrawn owing to the high reserves put on by owners. Following are the quotations:—

	Washed.	Greasy.
Shrop. and Downs	13½d to 14½d	10½d to 11d
Fine Hogs.....	13d to 13½d	10d
Fine Wethers.....	12½d to 12½d	10d
Strong Hogs.....	12½d to 13d	9½d to 9½d
Strong Wethers.....	11½d to 12½d	8½d to 9½d
Mountain and Sea-side.....	9½d to 11½d	8½d to 9d
Blackface and		
Scotch.....	8½d to 10d	7½d to 8½d

Royal Agricultural College Flock of Cotswold Sheep.

The following honours have been awarded to the sheep exported from the farm of the Royal Agricultural College, Cirencester, to Canada in the present year, viz.: At Toronto Show: Cotswold shearing ram, 2nd prize; Cotswold ram lamb, 1st and 2nd prize; Cotswold ewe lamb, 1st and 2nd prize.

At London, Ontario: Cotswold shearing ram, 2nd prize; Cotswold ram lambs, 1st and 2nd prize; Cotswold ewe lambs, 1st, 2nd, and 3rd prizes.

At Detroit: Hampshire ram lambs, 2nd prize; Hampshire ewe lambs, 1st and 3rd prizes.

Leicester Sheep Exportations.

A strong demand has been maintained for Leicester sheep this season, both for home and for export. Mr. E. F. Jordan, of Driffield, Yorkshire, has sold twenty-eight rams and ewes for shipment to Tasmania, to Mr. Oliver (who made a personal selection) and Mr. Simons, of that colony. Several of the sheep were prizewinners. Mr. G. Harrison, of Darlington, also a Leicester breeder, has recently sold both ewes and shearing rams for New Zealand, Tasmania, and South America at good prices.

Contagious Diseases of Animals.

Summary of Returns issued by the Board of Agriculture for the week ending Nov. 20, 1906:—

Disease.	Swine Fever.	Swine Slaughtered as Diseased or Exposed to Infection.	No.	Outbreaks.	No.	Sheep Scab.	Outbreaks Reported.	No.	Rabies.	Cases Confirmed.	Other Animals.	No.	Glanders (including Farcy).	Animals Attacked.	No.	Foot-and-Mouth Disease.	Animals Attacked.	No.	Anthrax.	Animals Attacked.	No.	Outbreaks.	No.	Period.

NOTE.—The figures for the current year are approximate only.

Notes and Jottings.

"He doth nothing but talk of his horse."
—"Merchant of Venice."

THE comparative scarcity of good brood mares has been a constant source of regret amongst those who have the interests of the horse breeding of the nation at heart, and though, perhaps, there has been a greater outcry than the real circumstances of the case actually warrant, as my readers do not need reminding is my opinion, still there is great room for improvement in the average quality of our brood mares; and there is no doubt that many of the mares which are mated with the King's premium horses are of very moderate class indeed, and are only calculated to fill the country with horses of which, in the present condition of things, there is only a very limited use.

ALL sorts of schemes more or less drastic have been suggested to ensure that only good mares should be bred from, and it has been argued that there should be legislation to prevent mares that are hereditarily unsound being put to the stud. On the face of it, this seems a very sensible argument, but it is pulled up short by the stern logic of facts. No worse roarer than Pocolontas ever trod on iron, yet Pocolontas stands out as the great brood mare of all time, whose offspring were—with one exception, I believe, the soundest of the sound, and from whom come some of the best horses that the world has ever seen.

IT has also been suggested that a heavy export duty should be put on mares, or even that there should be a law forbidding their export altogether, as there was a law prohibiting the export of sheep in the Middle Ages, but these suggestions being quite impracticable in these days do not need discussion.

AS usual, in anything relating to agriculture or the breeding of pedigree stock, it is a country gentleman who has taken the first initial step towards the keeping of good brood mares in the country, and though necessarily it was only on a small scale, it was a move in the right direction. Surely it is unnecessary to say that I allude to the Duke of Portland's scheme, which has been followed up by the Brood Mare Society—a society which has done infinite good, and which ought by this time to have had ten times the number of members there are on its books.

NOW another plan has been put forward by Lord Harrington, and as might have been expected from a man of such sound knowledge and wide experience in matters relating to horses and horse breeding, there is much to commend his plan. It is that the country should be divided into five districts, and that in each district fifty premiums of £10 each should be given for fillies likely to make brood mares, on condition that those fillies which would be branded with a Government brand, and should not be exported without a special licence. Lord Harrington also would have the hunts of each district supplement the premiums given by the Government, for the Government would, according to his scheme, provide the money, with premiums of £5 each. About this supplementary premium there would be no difficulty whatever, but the rest of the scheme has a few weak points which I shall proceed to notice.

FIRST, however, it must be said in its favour that it is not a costly scheme, and £2,500 per annum, even with the inordinately extravagant red-tapism which surrounds all work undertaken by the Government, would not be too much to pay to ensure that 250 of the best fillies in the kingdom should be kept at home for stud purposes. And under the scheme, if it worked well, we should soon have a very fine lot of brood mares, and the horses of the country would be of a much greater value than they are at present.

THERE is one thing, however, which I think would require changing if ever Lord Harrington's scheme should be adopted. Five districts are too few into which to divide the country. This division would entail so much expense on breeders in proportion to the sum of money to be

gained—£15 at the most—that a great deal of it would be forestalled in preparation and preliminary expenses before the premium was won. And this would, I think, prevent men from taking their best mares, for though men take their horses long distances to shows at present, it is to show where winning opens out instead of limiting the market.

THAT the market would be limited to the extent of the foreign trade is of course what is wanted, but the home market would undoubtedly be affected, and the value of mares with a brand on them would certainly suffer to quite the amount of the premium offered. I do not say that I would not ride a branded horse, or that I would not drive one, but most assuredly I should want the horse, for it is nothing else, to be considered in the price. This I take to be the weakest part of Lord Harrington's proposals, and the one which it would be the most difficult to get rid of. The question of districts could easily be settled, but the question of preventing premium winners from being exported without practically blemishing them is one of extreme difficulty.

THERE are many farmers and breeders—small breeders, too—whom this plan would benefit to a considerable extent. They are those enterprising men of whom I have frequently had occasion to write, who will never part with fillies of a certain strain for either home or foreign market until they have others of the same line. These men—and I could name a great number of them—are the foundation of pedigree horse breeding. Without them it would have been nothing, and they deserve encouragement and reward. But I question whether what may be termed the rank-and-file of small breeders would care to enter their good fillies at a show which would limit their chances of selling.

NOWADAYS the breeder, by whom I do not mean the man who breeds extensively and systematically, but the man whom for want of a better word I will term the casual breeder, wants a ready turn over. He wants to sell his young stock at two or three years old, and the first question he would ask himself when the schedule of conditions came into his hands would be: "Will the £15 premium or what remains of it after expenses are paid be more than or equal to the difference between the price of a good filly will bring in the home market and the foreign market?" I think the conclusion that he would come to would be that in the majority of cases it would not be, and I think that conclusion to be justified by the experience of a quarter of a century's intimacy with the foreign horse trade. Therefore, if the breeder of this class did send any fillies—and probably he would—he would not send his best. And it is his best we want.

IT would perhaps be as well to give a few instances of the difference in the prices in the home and foreign market. A friend of mine once sold a remarkably good young mare, and was regretting afterwards that she went out of the country; and on my asking him why he sold her out of the country, his reply was that, though not anxious to sell her, he did not feel justified in not putting her in price when a customer came along, and that he got all he asked—200 guineas. "My best home bid was £130," added he. Now, I would ask—What man farming a couple of hundred acres of land could reasonably be expected to sacrifice £80 "for the good of the country?" This, it may be said, was an exceptional case. Let me give another: Many years ago I sold some three-year-old fillies to go abroad. I got sixty-five guineas for one and sixty for the other. I could not have got more than £40 each for them in the home market unless a foreign buyer had been in the country, and had given a commission to a dealer. There is the case in a nutshell.

ONE thing which wants constantly keeping in view, and that is that for a small farmer to breed profitably his mares must work on the land; that is unless he be a specialist. This of course entirely alters the state of things, and the specialist and his needs we are not discussing. Any scheme which has the encouragement of the casual breeder for its object must carefully keep this in view. It has been kept in view to a great extent by the Duke of Portland, and it is at the foundation of the policy of the Brood Mare Society.

THE Brood Mare Society is certainly working on right lines, and has perhaps done more good in proportion to the money expended than any other society has done or than any Government is likely to do. It is to the extension and development of the society that we have, in my opinion, to look for the solution of the difficult question of the supply of brood mares. The only pecuniary condition insisted on by the Brood Mare Society is that they should have the right of the first set of fillies bred from their mares at a certain

A destructive fire occurred at Pennington Farm, near Ulverston, on Saturday week. The fire originated in a barn, and, fanned by a strong wind, spread with alarming rapidity, and soon the farm buildings were enveloped and completely gutted. Three cattle were burned to death, together with a large number of pigs and poultry.

price, which, it may be added, is a remunerative one. There seems to me to be no reason why the Government should not subsidise this excellent society to the extent, say, of the cost of Lord Harrington's scheme, and there seem several good reasons why they should do something of this kind rather than establish Government studs. Cheapness for one thing, and by cheapness I mean results in proportion to expenditure. The official work of a Government horse-breeding department would cost as much as this, and would really produce nothing but a lot of papers tied up in red tape. What the Brood Mare Society has done is familiar to everyone taking an interest in the subject, and why it does not increase more rapidly than it does is what I cannot understand.

THE LOOKER-ON.

The Polo and Riding Pony Show, 1907.

The official report of the recent meeting of the council of the Polo and Riding Pony Society foreshadowed additional classes and prizes for Polo and riding ponies at the eighth annual London Show, to be held at the Royal Agricultural Hall on March 15 and 16 next.

No material alterations are made in the breeding section, which provides five classes for young stock, three for brood mares, one for the produce

terests of the Polo player and the breeder, both equally concerned in the production of high class Polo ponies.

Shetland Pony Mare Temerity.

Our illustration on this page is of the Shetland pony mare Temerity, who was first in her class, and also winner of a silver medal, at the Royal Show this year at Derby. Her sire was Thor (83) and her dam Torpuz (1116). She is the property of Mrs. A. J. Beale, of Caskettes, Cudham, Kent, but was bred by the Marquis of Londonderry, of Bressay, Shetland.

VETERINARY.

Advice of a Veterinary character, by an M.R.C.V.S., is offered to Readers entirely free of charge. Particulars of cases should be addressed to the Editor, "MARK LANE EXPRESS," 3, Wellington Street, Strand, London, W.C.

Cow with Obstruction in Nose.

I have a cow that makes a kind of snoring noise in the nose; has had it some time; holds her head straight out in front of her; discharges a little down the one nostril; does not sink in flesh, and does not affect her eating. Could you

SHETLAND PONY MARE, "TEMERITY."

of registered dams, and four for stallions. It will, however, interest many gentlemen purchasing ponies during the winter to learn that in the riding section there will be increased classes and prizes. To take one instance—the class for novices (*i.e.*, Polo ponies that have never played in a tournament)—two sections are provided, instead of one as formerly, for light and heavy weights, with prizes in each section amounting to £21. Again, in the classes for Polo ponies, the classes for both heavy and light weights have been increased, the first prizes being now £15. And it will undoubtedly be an inducement to owners to enter when they learn that the first prize winners in both of these classes for the past three years are debarré from competing.

An interesting exhibition should be the outcome of Mr. Dunbar Kelly's cup, value £10, for the best pony in the show whose sire or dam is registered in the Polo and Riding Pony Stud Book, and which has been reasonably played during any season at any recognised Polo club. It is patent to any one that if the society is to secure the support of Polo players, the Stud Book must of necessity be intimately connected with the Polo ground. The interesting competitions which attract a large company annually to the Agricultural Hall will be strengthened by the introduction of two "turning races," necessitating competitors starting in pairs, traversing the length of the ring six times round posts fixed at each end, a complete circle being made at each turn. The total amount of prizes placed at the disposal of Polo players and breeders will be £476. And the recent decision of the council to consider the desirability of securing the co-operation of the Hurlingham official measurer to pass ponies entered for the Stud Book marks another step towards the co-ordination of the in-

give any reason as to cause of it, and what treatment?—J. R.

Answer: There is clearly some obstruction to breathing, and the snoring noise and the flux from the nostrils suggests that it is situated in the nasal chambers, but the "reason as to the cause" could only be determined on careful examination. As the "treatment" must necessarily depend on the nature or cause of the obstruction, we regret that we cannot help you. In such a case an examination by an experienced veterinary surgeon is almost a necessity, for the assumption is a fair one that you have already endeavoured to determine the cause of the obstruction giving rise to the snoring noise, and have found nothing. A not unlikely cause is the existence of a polypus in the nasal chamber. Youatt records a case in which, while the pedicle of the excrescence might be traced in the nasal chamber, the main part of the tumour, which on removal was found to weigh nearly half a pound, hung down in the pharynx. Polypi of all sizes are found in different positions in the nostrils. Another possible cause of the snoring noise is thickness of the mucous membrane lining the nostrils; but there, we might go on speculating for a day, and get no nearer the actual cause.

As there are two East Kent gentlemen nominated for the council of the Royal Agricultural Society of England, Mr. Walter Stunt has withdrawn in favour of Mr. Fitzwalter Plumtre.

Battle Cattle Fair. The annual cattle fair at Battle on Thursday was favoured by fine weather. Sussex steers made up to £10 5s., cross-bred heifers and steers up to £10, and cows with calves £16 10s. The highest bid for a horse was 40 guineas; powerful cart animals making up to 25 guineas, and carriage horses up to 16½ guineas.

HEARSON'S CHAMPION INCUBATORS

During the past season, and last season, the Hearsen's Incubators have been used by many of the best poultry keepers in the country, and have produced the highest percentage of successful results.

Notes and Jottings.

THE weather still continues remarkably mild for the season, and so far as fodder is concerned is helping the winter forward at a very modest cost for store cattle at a time when they are to be pushed for milk or beef purposes. So far as the latter are concerned, the mild weather is very much against the trade, though in spite of this it has assumed, as we had anticipated in these columns for some time past, a very much brighter aspect than for a long time past. A little clear, bright frost would be very beneficial to the beef business from this onward to the shortest day, or till the Christmas holidays are over, always provided, of course, that no snow falls. A thick covering of this valuable protector is good for many things, but in these days of perpetual hurry it is to be feared a great many people and cattle would suffer.

THE fat stock show season has so far made a start as that the great annual Eastern Counties Show has been held at Norwich, and with the usual results so far as the quality of the stock is concerned, though it is quite probable there will be better cattle at some of the other shows that are patronised by the northern feeders, and where all the other pure breeds of cattle have an opportunity of showing their good properties. The Norfolk Society appears to be rather unfortunate in respect to their judges in some measure. Last year intense dissatisfaction was expressed at the placing of the championship, and it may be said that the after-shows proved the correctness and need of the objections raised by the general public, as the Norwich champion never repeated her success.

THIS year the same complaint again arises, but upon this occasion the objection is as strong against the first prize award in the class where the general favourite lay as it is against the placing of the championship. There is no breed prejudice whatever to raise people's ire, the two animals being of similar breeding, but the great discrepancy that raises the feeling of the public is in the matter of weight, and this brings one to the consideration as to whether there ought not to be a bottom limit of weight, below which no prize ought to be awarded, especially in all classes where the large breeds or their crosses are concerned. Were such a limit established in the conditions of each class it would tend to make much more uniform classes than we have at present, and would have a tendency to induce breeders to pay more attention to size.

THERE are many reasons why size ought to receive more attention from the breeder than it does; one reason, and a very important one, is that it has been proven over and over again that you cannot reduce size down to the scale that is now being practised with some of our large breeds without increasing the preponderance of fat, and, in common with reducing the total weight, the weight of lean is also reduced proportionately more than that of the fat. To give a first prize to an animal of the large breeds that does not weigh above 13 cwt. at nearly three years old, it must be confessed, is carrying the matter too far, and a limit of 15 cwt. would be none too low to prevent the breeding and exhibiting of these toy cattle in the full-sized breed classes. The discrepancy between the judges' and public's opinions would in this case have been prevented had there been a 15 cwt. limit.

THE encouragement of the breeding of so small a class of cattle has a very bad effect upon the future of our stock supply. At many of the auctions where store cattle are sold in their thousands one is continually hearing from grazier purchasers very loud complaints of want of growth in these lots of cattle. To give first prize to a beast of 13 cwt. at an age that certainly ought to have accounted for at least 15 cwt. is putting a premium on the breeding and bringing out into the store cattle markets these growthless, little, stunted specimens. The animal in question, it may safely be said, under ordinary feeding would not have weighed more than 7 to 8 cwt., and therefore would not have realised a sufficient sum to have paid for its keep.

THE general appearance of the Norwich classes this year shows very decidedly a greater want of symmetry than has been seen for some time. It is quite probable that this is due in a large measure to the greater attention that is being paid to milk breeding. Many of the ordinary bred exhibits at Norwich were doubtless bred in herds where dairying plays an important part, and where strong bulls adapted to dairy breeding are more generally in use. The beef off these animals will no doubt be more muscular and less fatty in its tissue, and therefore better adapted to the generality of consumers. As long as the size is kept up, however, the increase of fat as it will where the size is allowed to deteriorate.

THOUGH the dead season is now decidedly upon us, the demand and prices obtaining for best pedigree Shorthorns does not give the least indication of relaxing. Prices in the Argentine remain as high as ever, and demand, which happily for our country is confined almost entirely to English or British stock, where importation has to be reckoned with as strong as ever. It is true that the present time of year is very long and pleasant one in the Argentine, but so long as matters progress in the way they are doing in that country, it matters not to us anything about the season of the year. Our first consideration must be the maintaining the standard of our Shorthorns and Herefords, so that the Argentine importer will still find this the best market whereto to renovate his herds.

IT is very gratifying to read that a large number of North Devon cattle have recently been shipped from their native county to breeders in various so far as the Argentine, Brazil, Australia, and British East Africa. No breed of cattle could possibly be better adapted to three of those countries than these juicy reds from the cream county, and there is no fear whatever of their not giving satisfaction, and where they have been selected from milking strains they will encourage the production of rich milk and cream as well as beef. For crossing upon native breeds the North Devon has proved of immense value on the continent of Europe, and will doubtless give as favourable results in other countries. It is one of our oldest pure breeds of cattle, and will, therefore, be more impressive in its labours.

Sale at Carlisle.

Messrs. Harrison held a special sale of pedigree and well-bred coloured and white Shorthorn cattle together with a number of pedigree Galloway heifers, at their Carlisle auction mart on Saturday week. Buyers were fairly numerous, and sellers realised generally satisfactory prices as follows:—Shorthorn bulls: Mr. Eeroyd, Low House, calved April 30, 1905, £29 10s., to Mr. Coulthard, Brisco Hall; Mr. Nelson, Undercragg, £26, to Mr. Beatty, Barrockside; Mr. Bell, New House, £21, to Mr. Johnstone, Durdan House; Mr. Hodgson, Drum-burgh Castle, £20, to Mr. Rickerby, Sandsfield; Mr. Nelson, Low Fell Side, £19 10s.; Mr. Hodgson, Craggs, £18. Galloway cattle: Heifers made to £14 2s. 6d.; store cattle, blue-grey bullock stirks, to £9 12s.

Miss A. de Rothschild's Fat Stock Sale.

The sale of fat stock at Waddesdon Manor last week, which was held by Mr. Burrows, of Thame, acting under the instructions of Miss A. de Rothschild, attracted a large attendance of buyers from all parts of the home counties. The cattle, mainly Angus and Shorthorn bullocks and heifers, ranged from £23 to £27 each, and there was a very ready demand for them at that average, many being bought for the London Christmas markets.

The sheep, however, formed the most interesting lots, nearly 150 head of Oxfordshire Downs from the famous Waddesdon flock being sold, mostly in pens of five, Mr. Boddington, Mr. J. Treadwell, Mr. Goodyer, Mr. J. W. Goss, and Mr. H. Rose being among the chief buyers. The ewes averaged 55s. a head, Mr. Treadwell, who is one of the oldest breeders of Oxfordshires in the country, paying 57s. a head for one pen and 53s. 6d. for another, but Mr. Boddington beat him in a keen competition for the possession of a small pen of ram lambs, the price at which they changed hands being 80s. a head. The top price for a single wether sheep was 82s., and others realised 81s., 78s., and 77s. each.

Royal Lancashire Agricultural Society Annual Report.

The council of the Royal Lancashire Agricultural Society, in their annual report, deal with the show held at Lancaster this year. The Lancaster Local Committee, they say, are to be heartily congratulated on the magnificent local fund raised from such a restricted area. From this fund £1,512 9s. 9d. was eventually handed over to the society. The heavy rains on the mornings of the

first three days of the show militated against the attendance from a distance, and the gate and stand receipts were £1,600 below the average for the past few years. Consequently there is great cause for gratification that the balance sheet is as favourable as it is, showing a profit on the year's workings of £24 14s. 11d.

The general balance in favour of the society now stands at £12,101 8s. 9d., as compared with £12,007 8s. 10d. at the corresponding date last year. The election of the record number of 169 new members upon one occasion has already been referred to. The total number elected throughout the year was eight vice-presidents, eight life members, and 203 annual members. The names removed from the membership roll from various causes numbered 84, and the present total on the books is 1,507.

The council record with regret the death during the year of one of their colleagues, Dr. W. W. Wingate-Saul, who for many years was a representative member for the Northern division. Other prominent supporters removed through the same cause have been Sir Thomas Brocklebank, Colonel H. B. H. Blundell, and Captain W. G. Pitt Miller.

The question of more suitable accommodation for the society's offices has occupied the council's attention during the year. After careful consideration they decided that the purchase of premises to form the society's headquarters and secretarial residence combined would not only facilitate the conduct of business, but prove a good financial investment, and they acquired a house in Winkley Square for the sum of £2,875. The Earl of Derby has kindly given permission for the house to be known as Derby House.

BOLTON NEXT YEAR.

An invitation to visit Bolton with the show of 1907 has been accepted. The same suitable site used on the occasion of the visit in 1894, with the addition of a further eight acres, has been placed at the society's disposal, and the council look forward with every confidence to the success of the society's visit to this populous and thriving centre.

Grooming of Cows.—The Sheffield Board of Guardians are being asked by one of its members to cancel a decision arrived at by the Farm Committee that the cows on the model farm at York shall be "groomed every morning, and that the udders be sponged before milking," on the ground that this will necessitate the employment of an extra man at a wage of about £1 per week.

Farmer's Improved Fowl House, No. 6a.

The Cheapest and Best in the Kingdom.
Intending purchasers should send for our Book of unsolicited testimonials and read what the public say.

These houses are built in Sections of best seasoned Deal, and the sides, ends, and floors are made from best 3-boards, tongued, grooved and matched, and planed. The roof is match-boarded and covered with Best Asphaltic Felt, easily put together in a few minutes, perfectly draught proof. **Properly Ventilated at Ridge and Eaves**, very strong and superior finish.

Mounted on four strong 13in. diameter iron wheels and wrought iron axles. Fitted with outside movable Nest Boxes, strong floor, movable perches, ladder, glass window, slide lock and key, complete. **Prompt Delivery.**

Lambs, 2nd class, £1 10s. to £1 10s. Young pigs, eight to ten weeks old, were in fair demand at from 20s. to 25s. each.

LINCOLNSHIRE FARMERS' UNION

Railway Rates: An Important Movement.

A meeting of the Central Committee of the Lincolnshire Farmers' Union was held at the Albion Hotel, Lincoln, on Friday afternoon. The chairman (Mr. Colin Campbell) presided, and there were also present Messrs. G. Bartholomew, A. W. Dean, J. D. Blanchard, T. Sharp, C. A. Bellwood, J. Brocklebank, E. W. Howard, W. Fowler, C. Clarke, J. C. Mountain, S. E. Dean, &c., with the secretary (Mr. H. W. Palmer).

Some Contrasts in Railway Rates.

A letter was read from Mr. E. J. Bullen, hon. secretary of the Midland Corn and Agricultural Trades Association, Ltd., referring to the conference held at Newark between representatives of the G.C.R., the G.N.R., the L. and N.W., and M.R. Companies and of that association and the Lincolnshire Farmers' Union on the subject of railway rates. The conference had discussed the organisation of a scale of rates for truck loads of grain, flour, cake, roots, manure, and other produce or requisites identical with or similar to those in force on the N.E. Railway for five ton loads, the application of the Hull to Newark six ton rate for barley only to wheat for milling and also to other grain, the organisation of reduced scales of rates for grain in six, twenty and fifty ton consignments, and the organisation of a definite scale of rates for pressed hay and straw in two and a half ton truck loads, and also for smaller quantities similar to those in force on the N.E.R. and L. and S.W. Railway. Mr. Bullen now wrote that he had received an official letter from the railway companies named with reference to the scale demanded at the conference, and that the companies had made a slight reduction in rates on five ton loads of grain conveyed in distances of not less than seventy miles, but in all other points they declined to accede to the request made.

The directors of the Midland Corn and Agricultural Trades Association, Ltd., had considered this reply, and condemned it as most unsatisfactory, and recommended that a very strong deputation should be formed from the Lincolnshire Farmers' Union, the Midland Corn and Agricultural Farmers' Association, the Millers' Association, the Malsters, the Notts Dairy Farmers' Club, &c., with the Members of Parliament for Lincolnshire, Notts, and other counties. Such a deputation could wait upon the President of the Board of Agriculture and ask for the introduction of a Government Bill for the regulation of railway rates on agricultural stock, produce, feeding stuffs, and manures. It was further suggested that such a Bill might include the enlargement of the powers of the Railway Commissioners in order that they might have power to make orders which should have the force of law, applying scales of rates or methods for making rates for railway conveyance of stock, produce, feeding stuffs, and manures. The Commissioners, it was added, might have the power to order experimental scales of rates on agricultural produce to be put in operation for three years, with leave to apply during the third year for the same to be discontinued. The time of the Christmas Fat Stock Show in London was suggested as suitable for the date of the deputation.

Mr. Bullen, addressing the meeting, said the rates on the N.E.R. and the G.E.R. were about 25 per cent. lower than in Lincolnshire, Notts, and the Midland counties. Farmers in the northern counties had expressed themselves at the Darlington Conference in favour of reform on the question of railway rates, and said it did not concern them so much because the N.E.R. had treated them so well, but it did not concern other parts of the country. The farmers of Lincolnshire and Notts appeared to have the misfortune to occupy a portion of the country where the rates were very much in excess of what they were in other parts of the country, and they had thought the best way was, in conjunction with each other, to go to the railway companies, and ask them to give them the same rates as the N.E.R. and the G.E.R. The companies practically replied, "No we won't." Mr. Bullen went on to state that it was important that such railway companies should be made to fall into line with good ones, and he ventured to tell that Union that nothing would do that but Government legislation. They might get some small concession by agitation, and the more they agitated, the more the railway companies would be willing to meet them in small details, but if they wanted something really substantial they must ask the Government to help them. It was their duty to ask the railway companies for the same rates as were charged to the Northern counties, to Norfolk farmers and to farmers in the south.

Mr. J. C. Mountain said that in consequence of the railway rates the Spalding market had an advantage over that of Lincoln. The G.E.R.

would carry grain 150 miles at 7s. 6d. per ton, and the G.N.R. would charge double, with the result that Lincolnshire wheat would not travel as it otherwise would, as they had to pay an extra rate and take a less price.

The meeting adopted the suggestion contained in Mr. Bullen's letter, and it was resolved that a deputation to Earl Carrington should include the chairman and secretary of the Lincolnshire Farmers' Union, with Messrs. W. S. Fox, J. D. Blanchard, J. Brocklebank, W. Taylor Sharpe, Bullen, H. J. Robinson, and the chairman and all each of the various branches of the Union.

It was resolved to invite Earl Carrington to the annual dinner of the union at Lincoln on January 25.

The German Gipsies.

Mr. E. W. Howard called attention to the alien gipsies who were raiding the country, and said fortunately these people had not passed through a great area of Lincolnshire, but from what he had heard they caused great inconvenience to residents by damaging fences, pilfering, and even taking hay to feed their horses. All this was under the eyes of a heavy escort of police. These police were rate paid, and were costing the country at the present time £70 per week. He thought the authorities ought to take some action to prosecute them. Mr. Howard concluded by moving, "That the Central Committee of the Lincolnshire Farmers' Union urge the Government to take some steps to get rid of the German gipsies who, by damaging fences, pilfering, and other offences, make their presence a source of danger to life and property, particularly in the remote districts of the country."

The resolution was carried.

The Tariff Commission's Report on Agriculture.

The report of the special Agricultural Committee appointed by the Tariff Commission was issued last week, and is signed by Mr. Henry Chaplin (chairman), Mr. J. Richard Barter, Mr. P. Blundell, Mr. Thomas Brown, Mr. W. Cooper, Mr. John W. Dennis, Lord Desborough, Mr. W. Frankish, Mr. J. M. Fraser, Sir William J. Goulding, Mr. P. R. Gray, Mr. John M. Harris, Mr. R. W. Hudson, Mr. George Malcolm, Mr. A. H. Matthews, Mr. F. Neame, Mr. Rouse Orlebar, the Hon. Cecil Parker, Mr. C. J. Phillips, Mr. Owen Price, and Mr. J. Stratton.

It will be recollected that the committee was instructed to examine the proposals submitted by Mr. Chamberlain to the country and to report to the commission as to (1) their effect on the present agricultural conditions; (2) whether any modification in detail was desirable, and, if so, what should be the nature of such modifications, having due regard to the general interests of the community; and (3) the best way in which the interests of the manufacturing and the agricultural industries, where they conflict, might be harmonised.

The publication now issued consists of six sections. The first contains the report proper, the second draft questions to witnesses, the third evidence of witnesses, the fourth forms of inquiry, the fifth replies to forms of inquiry, and the sixth memoranda. Having carefully considered the nature of the inquiry the committee found that, in order to give full effect to it, it would be necessary not only to investigate present agricultural conditions in the United Kingdom, but to undertake a wide survey of British agricultural policy and of international market conditions in modern times. The committee has, therefore, included in the report a survey of agricultural policy in past times, especially of the group of statutes and other measures known as the Corn Laws.

Thirty-three meetings were held and 147 witnesses examined. These witnesses including farmers, land agents, and others, many of them nominated by chambers of agriculture and other agricultural bodies in all parts of the country. But in addition to the oral evidence replies to forms of inquiry were received from 2,104 agriculturists and others concerned in agriculture. The evidence is thus based on oral and written statements from 2,251 farmers and agriculturists generally who hold and own farms whose total area is stated to be about 1,900,000 acres.

The committee made full use of the reports of previous commissions and committees—such as the Royal Commissions on Agricultural Depression, 1880-82 and 1905-07, and the Gold and Silver Commission, 1887-88, &c.

THE COMMITTEE'S CONCLUSIONS.

The main conclusions to which the committee are led as to the present condition of agriculture are as follows:—

1. The production of wheat in the United King-

WE MAKE GUNS

We sell to the user with only one small profit.
We sell for cash direct to the user.
We buy the finest materials to be obtained.
We pay cash for all materials.
We employ some of the finest workmen in the Gun Trade.
We use finest machinery for machine operations.

RESULT.

We sell for £25 Guns of a quality for which sportsmen have previously paid from £50 to £80.

We sell thoroughly reliable Guns.

We get the finest shooting it is possible for guns to make.

Our "Field" Hammerless Ejector Gun.—A perfect Ejector Gun of the finest quality, £25. It made with the best single trigger mechanism ever invented, £30. A perfect pair of these Guns, beautifully matched, £50. A perfect pair of Single Trigger Guns, £60.

"The Gun of the Future," as an Ejector, £15. "The Gun of the Future," without Ejector, £10. A sound and reliable gun, well made, and perfectly balanced, which will give entire satisfaction.

Pattern 8662, £6.—A sound and reliable hard shooting and hard wearing hammerless gun. Better than many sold at double the price.

Pattern 8368, £4.—A sound and reliable hard shooting and hard wearing hammer gun. Better than many sold at double the price.

PRICE STREET, BIRMINGHAM.

dom, which in the period 1841-45 was sufficient for 24,000,000 persons, or nearly 90 per cent. of the population, has since that time steadily declined until home-grown wheat now feeds little more than 4½ millions, or 10.6 per cent. of the population.

2. With the single exception of oats in England, all other corn crops in the United Kingdom show considerable decline, though in no case to the same extent as wheat. Taking corn crops as a whole, the area cultivated has declined 3,000,000 acres, or nearly 40 per cent. in the last thirty years.

3. This serious reduction in corn cultivation has synchronised during the last thirty years with a decline amounting to over one-sixth in the area under green crops.

4. The area under grass has increased by nearly one-third in the same period; this increase has not sufficed to make up for the decline in arable cultivation, and the quantity of meat produced from home-fed stock has only increased by less than 5 per cent.

5. Whereas home-fed meats represented 85 per cent. of the total consumption thirty years ago, they now represent 55 per cent. only.

6. The importations of dairy produce have increased about 140 per cent. during the last thirty years, and dairy farmers in most parts of the United Kingdom have been led to devote themselves more and more to milk farming, in which foreign competition has not developed to any extent.

7. The dependence of the United Kingdom upon imported food supplies of all kinds has increased from 121 to 205 millions sterling since 1875, and allowing for the fall in prices, the volume of food imports is estimated to have increased during the same period by 130 per cent., or nearly four times as much as the increase in population.

8. The foreign producer, especially of wheat and meat, has not only supplied the increased British home demand due to increased population and increased consuming power of the population, but has also taken from the British farmer a large part of the market upon which, having no export trade, his existence depends.

9. Agriculture in almost every branch shows a great decline, despite a very large increase in the population and a consequent increase in the demand for agricultural produce.

10. There has been a general fall of prices during the last thirty years, due to monetary and other causes affecting nearly all commodities, and fluctuations of this character are to be anticipated in the future. But the prime cause of the decline in agriculture is the greater fall, especially in the case of corn, in agricultural prices than in prices generally.

11. In the case of agriculture, the effect of the fall in prices has been accentuated by other causes, such as (a) the greater relative increase in the burden of local and Imperial taxation upon the land; (b) transport conditions; and (c) the inability of the Board of Agriculture to aid the British farmer as his foreign competitors are aided.

12. The position of the United Kingdom is absolutely exceptional. No other country shows so marked a decline of agriculture; no other country depends to so large an extent upon importations from abroad for its food supply; in no other country has the balance between agriculture and manufacturing industries been so completely disturbed to the disadvantage of agriculture. This remarkable decline of agriculture is not alone a menace to national security, but by restricting the home market must have a most prejudicial effect upon the general industry of the country.

PROVISIONAL SCALE OF DUTIES.

The following provisional scale of duties is inserted in the report on the same principle as the provisional scheme recommended in the iron and steel and other reports of the Tariff Commission.

	General Tariff.	Preferential Tariff.
Wheat ..	6d. per cwt. (or about 2s. per qr.)	3d. per cwt. (or about 1s. per qr.)
Barley, oats, rye, maize, &c. ..	Duties equivalent to those on wheat.	Duties equivalent to those on wheat.
Wheaten and other flour and meal ..	1s. 3d. per cwt.	
Animals and meat, including bacon ..	General level to be 5 per cent.	
Dairy produce, including poultry and eggs ..	Specific duties equivalent in general to from 5 to 10 per cent. ad val. though in particular cases some duties when calculated may be found to be lower and in others rather higher than these limits.	Subject to negotiation with the Colonies.
Market garden produce, including potatoes and hops.		
Hay and straw.		

The subject of agricultural machinery will be dealt with in the report on the engineering industry and in the final report. In regard to feeding stuffs and fertilisers the general rule would be that they should be imported free; but the subject belongs in the main to the chemical industry, and will be dealt with in the report on that industry and in the final report.

E. R. & F. TURNER, Ltd.,
(147) IPSWICH.

A Walk Round the Borough.

Unfortunately my perambulations this week have not been satisfactory, for whosoever I have come in contact with, has had a gloomy face when business is mentioned. Neither factor nor merchant can say an encouraging word, and more than one reply to my queries as to the condition of trade, has been expressed not elegantly, but emphatically, by the use of the single word, "rotten."

When all agree, there is no room for debate, we are bound to accept the unanimous verdict, and can only seek for the causes which have produced such miserable results. The "fons malarum" is unquestionably the indifference of the brewers.

It is useless to appeal to them for sympathy. In urging the great outlay incurred by growers this season in securing their small crop, they point to their purchases of last year, and naturally retort, that if they had not then bought so largely, growers would have been left with an immense surplus, which would now be hanging on their hands, probably making the present position of the market much worse than we now find it. If demand, by which I mean brewers' demand, could be stimulated by any means, the trade would rally, and prices would advance, but so long as this is absent business must languish, and values will necessarily tend towards reductions.

We are also drawing near to Christmas, and although from a social point of view we welcome this season, we know that holidays are damaging to our department of trade; therefore, it hardly appears probable that we shall see any revival until the opening of the new year.

Foreign competition is also an element to be reckoned with. Belgian hops are being pressed upon our market at very low prices. The quality of these growths having been much improved by the education and subsidising of the growers, they are finding better favour than formerly in the estimation of our consumers. Such hops can be easily bought in London as low as 6.5s. Then again, there are full supplies of Bavarians at 80s. to 85s., and American houses are working hard to secure contracts at 75s. to 85s.

Such pressure must have left its effect on the minds of our buyers, and although the unsold balance of the English crop is now reduced to a comparatively low point, we can hardly be surprised if, under these circumstances, bids are being lowered. Happily there is just sufficient firmness on the part of holders to avoid any very decided weakness, and although, in the absence of actual business, it is almost impossible to quote prices, it is so far satisfactory to be able to say that there has been no perceptible fall in values this week. There still remains a sufficient steadiness about the market to enable us to hope that prices will remain where they are at present, and if this hope can be realised we may perhaps reasonably expect that they will be better after Christmas.

All traders will be glad when this disappointing season comes to an end, for it is universally admitted that a more unsatisfactory and unprofitable experience has not passed over the Borough within the memory of this generation. Does not this fact sufficiently dispose of the accusation that the Borough traders are responsible for the condition of business as we now find it? Office, warehouse, and travelling expenses, can only be paid out of profits, yet they are daily burdens and must be endured.

It is therefore self-evident that the interests of our factors and merchants are on the side of good prices. What is best for the growers is also best for the Borough, and it is foolish to attempt to raise an agitation against members of the trade whose main object must be to see the English hop industry flourishing, as they are well aware that when this is the case prosperity is mutual.

Foreign Markets.

America.

It appears from a cable message I received this week that the trade on the other side of the Atlantic is even more unsatisfactory than our own. The message says:—"Market is demoralised, growers are more willing to sell, and dealers are not operating. No improvement is anticipated in the near future."

This information is confirmed in a letter from one of the leading New York merchants who ascribes the flatness to the same cause that is evident in England, viz., the absolute indifference of brewers. The stocks held by them make them independent of the market conditions, and the knowledge that the crop is far in excess of their requirements naturally keeps them free from any anxiety concerning future supplies.

I have been visited this week by an important grower, whose yards of 150 acres are near to Santa Rosa, and about 30 miles from San Francisco. He produced over 1,000 bales this year, nearly a ton per acre, and having sold 1,000 bales to local buyers at 14 cents per lb., he sought a market for the balance on this side, and was much surprised that he could not find an outlet at a profitable price.

A report had been set afloat in Santa Rosa that good Pacifics were selling here at 35 cents, equal to about £8 per cwt. . . . My visitor was soon undeceived, and seemed to wish he had taken his chance at home. On the basis of this absurd rumour a movement has been proposed in this city to form a syndicate for consigning hops to England, but this will certainly fall through when the truth is known. I am surprised that one of our contemporaries, circulating largely in Kent, has given publicity, without comment, to this ridiculous proposal, quoting as their authority the *Watercille Times*, a New York journal that should certainly be better informed.

Nuremberg.

Business continues to be very active, and the demand for choice green samples has so far reduced the stocks that the medium sorts are receiving attention, with the result that values have generally advanced. This improvement has been also extended to the lower grades. The local demand is very strong, and it is supported by many orders for exportation, especially to America.

This would appear incomprehensible in face of the large supplies existing there, but the brewers of Pilsener and other Lager beers in the United States are willing to pay almost any price for Bavarian hops, in addition to the heavy import duty, in order to secure the desired flavour for their beers. The arrivals at Nuremberg during the week ending November 15 were 4,200 bales, and the sales in same days 5,300 bales, showing a diminution of stocks of 1,100 bales. Latest reports show that the market is excessively firm, with a tendency to further advance in quotations.

Belgium.

The local brewery demand being only in small quantities, and the export trade being practically at a stand, the tone of the markets, both in town and country is in the direction of weakness. Holders are very desirous to sell and are lowering their offers, but without any important response from buyers. Recent prices of 65 to 67½ francs for Alosts, and 62½ francs for Popperinghes, are hardly supported, and it seems probable that lower figures will be heard of shortly.

The fourth and last hop fair at Asselie was held at the close of last month. There was a large attendance both of growers and buyers. The display of hops was the most important ever seen in a Belgian market, and the quality being excel-

lent the whole were speedily disposed of at full prices.

Royal Counties' Agricultural Society.

At a meeting of the council of the Royal Counties' Agricultural Society held at Basingstoke on Wednesday, November 21 (Sir George Cooper, president, in the chair) the secretary presented the draft report and statement of accounts for the past year, showing a balance in favour of the society of £5,721, as against £5,771 at the end of 1905, the difference being more than accounted for by the fall in price of the society's investments.

The question of the date of the 1907 show was discussed at considerable length, and the secretary read correspondence which had taken place between himself and the secretary of the Bath and West of England Society and other gentlemen with reference to the matter. General regret was expressed that the Council of the Bath and West of England Society were unable to make any concession in allowing exhibitors of stock to leave the showyard earlier on the last day of the Newport meeting so as to enable the stock to be exhibited at the Maidenhead Show, but in view of this unfortunate circumstance, and also the fact that it had been arranged to hold an International Horse Show in London during the same week so that the Royal Counties' Show would clash with that, and also with the Jubilee Show of the Essex Society, and the Richmond Horse Show it was eventually resolved to alter the date of the Maidenhead meeting to May 28, 29, 30, and 31, with the understanding that this alteration would only hold good for one year, and that the society would afterwards revert to its usual date.

Truro District Farmers' Combine—Mutual Insurance.

Mr. W. Lord on Wednesday presided over the annual meeting of Truro District Mutual Insurance Co., Ltd. (the members of which are principally agriculturists). The ninth annual report stated that the total membership was 156, as against 130 last year, the amount payable for contribution being £178,294, as against £140,008 last year, making an increase on the business of the year of £29,286. The annual premium (based on an average rate of 5s. per cent.) charged by ordinary tariff companies on the total value of property insured by them would be £445 4s. 9d.; the liability of the company for that amount for the past year had been £24 12s. 9d., thereby saving £420 12s. That proved conclusively the great advantages of combination. The company had been established for nine years, with an average liability per member (exclusive of entrance fees) of 8d. per cent. per annum. For five years the average liability had not exceeded 3d. per cent. per annum, and for the last three years the entrance fees had met all the company's liabilities. A call of 1s. per cent. was made in March last, realising £80 2s. 9d., which had been placed to the credit of the company, the reserve fund, current account, and cash in hand amounting to £340 5s. 6d. The directors thought it desirable to further strengthen the reserve fund, and they proposed that a call of 1s. per cent. be again made in April next. It was evident by the steady growth of the company year by year that the practical benefits which had been obtained by co-operation were being appreciated. The balance of assets over liabilities of the company was now £325.

At a meeting of the Cleveland Chamber of Agriculture on Tuesday, some discussion took place regarding the recommendation of the Motor Car Commission in favour of the abolition of the speed limit. The chairman proposed a resolution protesting against the abolition of the speed limit, which, he said, acted as a caution to motorists, and was far and away excessive in narrow roads, for some sharp corners were perfect death traps through this traffic. The resolution was unanimously adopted.

PRICE ONE SHILLING. BY POST 14.

THE FARMERS' RED BOOK

Will be on Sale throughout the United Kingdom EARLY IN DECEMBER. Give order at once to your Local Bookstall, Bookseller or Newsagent, and thus

SAVE POSTAGE.

THE AGRICULTURAL ANNUAL

By Post 1/4

This useful Year-Book can be obtained direct from the Publisher,

THE "HUNTER" BUGGY.

National Telephone—1232 Seven, Telegrams—"Buggies, Glasgow"

Also COVERLESS CARS.

Bladnoch, Wigtownshire.

DEAR SIR,—As you are aware, I purchased the Buggy which belonged to the late Mr. Parlant, Craigellach, it being one of your build. This Buggy is the most comfortable trap I ever sat in. The small 12-hood pony draws it with the greatest ease. As I understand, Mr. Parlant used it for three or four years, and ran it a good deal; it is as good as new, the rubber tyres being faultless.—Yours truly,
JOHN MCCLUNPHIA, Draper.

Fat Stock Shows.

CHRISTMAS is now in sight, and in company with its approach we have the various institutions all over the country. In this direction, as in many others, it is easy to observe how competition in the show ring is wrapped up with the agricultural trade of the country. The average Briton's taste for prime roast beef at Christmas time is proverbial, and the farmer's business is to make provisions for the supply of that taste. Does the fat stock show help him at all? Assuredly yes, if it does nothing more than to bring buyers and sellers together. We hear of a certain beast winning honours at a local fat stock show, and may take it that the very fact of the animal doing this increases its market value somewhat. Just so, and when the said animal becomes beef and is displayed in the butcher's window the tradesman does not forget to inform his customers that he has prize meat to offer. The average purchaser does not know much about prize fat stock, but naturally assumes that prize beef must be the kind to have for Christmas, and consequently goes in for it. He does not often make a mistake in doing this, so quite a ring of persons are benefited directly and indirectly through the fat-stock show.

Weight-Guessing Competitions.

IT is now a common custom in connection with Christmas fat-stock shows to offer prizes to those who may like to have a guess at the dead weight of a bullock provided for the purpose. Usually these competitions arouse a good deal of interest, and are a means of testing the judgment of farmers and others in estimating the weight of an animal. It is not an uninteresting sight to observe a man who professes to know a thing or two about the weight of an animal looking over a beast before he hazards an opinion on its bulk. He walks round and round the bullock (who doubtless wonders what all the prodding and pinching he has to undergo means), measures the quarters with his eye, makes numerous mental calculations, and eventually hands in his figures. It is given naturally to some men to be able to calculate very accurately the weight of a beast, and others acquire the capacity through long practice; but in any case it is good for any man who has anything to do with buying and selling of fat stock to be a reliable judge of weight. We unhesitatingly commend weight-guessing competitions to our young farmer readers as a means of education, because if they make an estimate of the weight of a live animal and then see the actual dressed weight published, they will gain experience in a matter that is of importance to them in business.

Potato Disease.

WE take it that all the potatoes grown for sale are now out of the ground (if not they ought to be), and every day we are receiving ominous reports of the ravages of disease. Throughout the past dry summer potato growers were hugging themselves that though the drought might lessen the crop, there would at least be no loss from disease, but we have learnt to realise that this trouble may be brought about by sudden climatic changes as much as by protracted wet, because we dug a good many diseased tubers before the dry weather broke up in September. Unfortunately, however, matters have got very much worse, and the rain which hampered the lifting of crops has had considerable influence in the spreading of the disease. We also hear complaints of the disease having increased rapidly since the crop of tubers was lifted and pitted, and some growers are rather afraid to look into their bulk. This state of affairs is disappointing because markets are promising, there are prospects of prices going up, and but for the disease, potatoes bid fair to be a profitable crop. It is argued in some quarters that heavy manuring is largely responsible for disease, but he this as it may it is obviously to the interest of a grower to produce as many tons to the acre as possible, even at the risk of getting some disease, and he is hardly likely to change his tactics on the strength of supposition. As for varieties, we have not got that much-desired disease-proof potato yet, but the experience of this season is causing some people to lose faith in Dates. If it is given up, which of the many other varieties should be planted in bulk instead? For the moment we leave the question unanswered.

What is Cider?

IF this question were put to any schoolboy of average intelligence he would naturally answer, the juice of the apple, but it would appear as if this is a point that has yet to be definitely settled. According to Mr. A. G. Brooke Hunt, of the Board of Agriculture (see page 540 in our issue for November 19), there is at present no definition as to what is pure cider. It might be contended that it was pure apple juice, but the law on the point could only be done in a test case. This is not very encouraging to the apple-growers and cider-makers, who are making a gallant attempt to protect their interests, which are doubtless injured to a very considerable extent by the sale of various concoctions that are called cider, but have never had any acquaintanceship with apple juice. But leaving out of the question the stuff that is made entirely from chemicals, there is need of much more uniformity in actual cider itself. We get bad beer at times, but it has some resemblance

to the genuine article, and we cannot say this about some of the cider we have offered to us at times. Apple juice it may be, and we have not time to dip into the process of making, but to call it cider is a libel on that pleasant, refreshing liquor, which happily is produced in the West Country. The unfortunate thing is that if the man in the street gets some of this libellous liquor when he sets out to drink cider he promptly gives up the idea and returns to his beer.

Seaweed as Manure.

TO inland farmers this paragraph will have little interest, but agriculturists who live near the coast have a valuable product at hand that is extremely useful in the manuring of land. Many of them do not need to be told about this, and during the winter season when seaweed is washed up by rough seas and deposited on the tide line the carting of the material on to the land for manurial purposes is a routine occupation. We learn from the agricultural chemist that the chief fertiliser contained in seaweed is potash, and in consequence of this alone it is a good fertiliser, but our experience with it has taught us that seaweed is an excellent thing to mix with farmyard manure prior to application. Not only does the organic matter in the seaweed decompose quickly, but it also aids the decomposition of the manure, and even if the latter contains much long litter it soon decays if seaweed is mixed with the heap and quickly becomes suitable for application on the land. In our opinion we consider that the best use is made of seaweed when it is mixed with heaps of yard manure for a time before it is applied.

Cottagers and Co-operation.

IN spite of the charges that are made against farmers that they are slow to see the benefits of combination, there are a good many farmers' co-operative societies in existence, and through these institutions vast quantities of artificial manures and feeding-stuffs are purchased every year on terms more favourable than if the members acted independently of each other. Our object in writing this paragraph is to ask whether cottagers and labourers could not benefit somewhat through local co-operative societies? The cottager does not use artificial manures much on his garden and allotment because of the difficulty in getting them in small quantities and at a reasonable price. We believe there are some farmers' co-operative societies that sell manure to cottagers on the same terms as they supply their members, but the cottagers not being actual paying members receive no share of any profits that this society may make. Taking a broad view of the whole matter, would

it not be possible to add cottagers' branches to farmers' co-operative societies, by means of which the former could obtain small quantities of artificial manures for his garden, allotment, or field, if he has one, feeding-stuff for his pig or other stock he may keep on terms similar to those enjoyed by farmers who operate in a large way? It is obvious that the interests of the country labourer and cottager are wrapped up with those of the farmer, and while the former is not in much of a way to help himself in a matter of this kind perhaps a co-operative body of farmers will extend a hand and assist him.

Single v. Double-furrow Plough.

IN a recent issue our North Country correspondent drew attention to the prejudice that has slowly sprung up in the north against the use of double-furrow ploughs. Our correspondent defends the double-furrow plough—we think rightly—as a labour saver and an economiser of horseflesh, and confesses himself to be at a loss to explain why the prejudice against this implement has come about. A suggested reason is that the "handling" of the double-furrow plough may test the stamina of the follower more severely, but this is not given as the only cause for abandoning the above implement. The matter is an interesting one, and we should like to hear the views of some of our farmer readers about it as to whether the double is

giving way to the single-furrow plough in other districts besides those referred to by our correspondent and the reason for it. Our correspondence page is always open to discussion on matters of this kind.

The Game and Poultry Trade.

CHRISTMAS is coming, and in many a farmyard the geese and turkeys that have been eating their heads off lately in order to increase the weight of their bodies are enjoying the last meals they are destined to consume, for a few weeks hence they will be in the market. What the trade will actually be at Christmas remains to be seen, but there is no doubt that the poultry-feeder's business is now affected to a considerable extent by the sportsman. Most of us have heard the definition of killing a pheasant as up goes a guinea and down comes three-and-sixpence, or words to that effect, and we know that a good deal of game now finds its way into the market. It is the fashion amongst the wealthy nowadays to rear a lot of birds in order to secure big bags, and this being the season of battues large quantities of game are now being sent to market. This order of things will doubtless continue up to Christmas, and though it has the advantage of affording the man in the street an opportunity for getting a brace of pheasants at a moderate price the people who rear poultry for the market can hardly be expected to reap any advantage.

Disappointed but not Captious.

I am sorry at the nature of the controversy which has arisen over the appointment of Sir James Woodhouse to the vacant Railway Commissionership. We had a right to object to transforming the Commission into a mere legal and industrial body, that is, so far as its personnel is concerned—indeed, the fact that the agricultural interest is without a direct representative on the body is somewhat in the nature of a scandal; but a controversy of the character to that which I have alluded must impair both the personal influence of Sir James and the general influence of the Commission. If anybody had justification for criticising the character of the appointment it was the agricultural interest. The absence of that criticism is an evidence not merely of self-control, but of a willingness to subordinate personal disappointment to the general dignity of the Commission. The controversy might certainly now very well cease, whilst those of us interested in the agrarian weal may well possess ourselves with the patient hope that an unexpected friend, who will seek to inform himself as to the necessities of agriculture, may reveal himself. We are naturally disappointed, but we are wise in showing ourselves to be not captious.

Fate of the Land Tenure Bill.

There is no doubt a wide belief in the Commons that the Lords will still further mutilate the Land Tenure Bill. This belief is due not to any new-born conviction that the measure is really more revolutionary than its authors conceive—as a fact, it has been emasculated until its virility is but a faint breath, but rather to the electric atmosphere which has been generated by the fevered education controversy. Mr. Balfour has given the command "No surrender" and with the Peers in for a fight with the Commons—or rather, with the Government—they will prefer to assault as many of its legislative progeny as come up to them for diagnosis and dissection. Frankly, I do not believe that the Government would care to include the Land Tenure Bill in their scheme of retaliation and resistance. They will no doubt prefer to concentrate their efforts on the Education Bill and the Plural Voting Bill, to the latter of which the Radical electioneers wisely attach the utmost importance, and which smells as rank sacrilege in the nostrils of the majority of the Peers. In that event, the Land Tenure Bill will, should it be still further debilitated, be dropped. I pray its antagonists not to chortle over this prospective fate. I tell them that the members of the Commons most disappointed with its present character are its sponsors, the executive committee of the Land Law Reform Committee.

If you heard these politicians—heard in particular what is their opinion of the exclusion of asparagus and strawberries from the operation of the measure—you would be pardoned the belief that in their view they have been subjected to an unmerited indignity and an unjust contumely at the hands of their leaders. Those leaders would somewhat prejudice their allegiance if, in dropping the Bill, they did not promise that from its corpse should, Phoenix-like, rise a measure infinitely more drastic than its predecessor and infinitely farther-reaching in its scope. And, after all, however much the peers may now thirst for the life-blood of the Government's offsprings, that is a temper which is bound to have its ebb. If not succeeded by remorse, it may—when the tension has been lessened—be succeeded by indifference. Even if the Bill be wrecked, Lord Turnour, Lord Helmsley, Colonel Kenyon Secney, and Sir Frederick Banbury will have secured nothing better than postponement, and a postponement which would mean what to them is a greater evil. The Land Tenure Bill, if killed, will have a virile resurrection.

A meeting of the Shropshire Chamber of Agriculture was held at Shrewsbury on Saturday week, when Mr. F. W. Wateridge proposed the appointment of a committee of land owners, land agents, and tenant farmers to consider the ways and means which he had suggested for improving agriculture. He argued that to meet cheap food imports high-class cultivation should be carried out to produce quality and quantity, and to enable farmers to go in for high-class cultivation the Government should provide money cheaply. Government loans should be secured as a first charge upon the land. A committee was appointed as proposed.

Agricultural Politics.

BY A LOBBYIST.

Significance of the Tariff Reform Report.

I am sorely afraid that the report of the Agricultural section of the Tariff Reform Commission has fallen on barren soil. True, a score of great journals, headed by the *Times* and the *Daily Telegraph*, have drawn deductions from it justified by their own political predilections; but, taken as a whole, the report has not seriously moved the public conscience. In the House of Commons I have scarcely heard it alluded to. It does not seem to have disturbed more than a ripple on the surface of Parliamentary emotion. And yet, forsooth, it is a document of the first agrarian significance. Aye, even the Radical—even he who believes that you will restore the fertility of the soil by mathematically chalking it out into areas of two or three or ten acres—may make deductions to it gratifying to his own heart. What picturesque lessons might he not draw from the facts that the area of the corn crops has declined 3,000,000 acres in the last thirty years, that this decline has synchronised with a decline of one-sixth of the area under green crops, that whereas the home-fed meats represented 85 per cent. of the total consumption thirty years ago they now represent but 55 per cent., that the imports of dairy produce have increased by about 140 per cent. in the last thirty years, and that in those thirty years the value of those very imports of articles of food which the Radical urges could be produced at home have increased four times as much as has the population? And yet when I mentioned these facts and revealed how clearly and succinctly they had been elucidated and illustrated in this elegantly-written report the ordinary Radical Parliamentarian only pshawed-pshawed the whole business away. What cared he for what came from the Chamberlain mint? The trail of the serpent must inevitably be over it.

A Disease not to be Cured by a Pill.

Frankly, I wish these portentous and ominous facts and illustrations had come from another source. This anxiety is due to no ineradicable antagonism on my part to the Tariff Reform Commission, and certainly not to any disbelief in the authority of the remarkable personalities composing this section of it. As a fact, however, the rival prejudices born of the tariff reform evangel has cleft the English-speaking world in twain. Here are facts potent with gravity, omens full of dramatic significance, and yet one-half of that world passes them by with a jaunt indifference and a professed contempt which, whether assumed or not, are fatal to a dispassionate national consideration of the evils. When we are confronted with the grim contrasting facts that no other European country shows so marked a decline in agriculture, that the unnecessary area under cultivation is colossal great, and that, this notwithstanding, no other country in the world depends so

large an extent upon importations from abroad "for her food supply," the exaggerated sentiments associated with the consideration of the mere fringe of the tenure problem becomes almost a banality. It is an attempt to cure the world of earthquakes by a dose of Morison pills. It is an attempt to subdue rebellion with a spray of rose-water. No man can survey the agricultural world, with the illuminating light afforded by the report of this Commission, with satisfaction. And yet I repeat that this admirable report, this excellently-sympathetic diagnosis, is by a half of our political leaders being passed deliberately by because they disapprove of its authors. Are there no means of presenting them to the nation and the people with their origin concealed? Why conceal their origin? The temper of the ordinary Radical, the temper of the present Parliamentary majority, in itself provides the reply; and that temper may be in the ascendant for several years.

Can we Divorce this Problem from Politics?

It is not necessary to discuss the suggested scale of duties. They will have no serious ameliorative influence so long as the gates are to be flung open for a deliberately-encouraged and fostered Colonial competition. "We can supply the whole of the necessities of the United Kingdom, as well as of ourselves," declares Canadian Statecraft; and the revelations just vouchsafed us of the growing fertility of the Saskatchewan Valley, of Athabaska, and of Alberta, would appear to justify this boast. "And," proceeds Canadian Statecraft, "with the sale of our products encouraged in the British markets by British statesmen, in return for throwing open our markets to their industrial products, we shall do this." Let us, however, exclude this matter for a moment from our consideration—though it is assuredly a thousand pities that the Commissioners did not show how, if a rebuked foreign competition is to be supplanted by a more voluminous and encouraged Colonial competition, the British farmer is to be saved and the area of British cultivation is to be increased—and concentrate our attention on the elucidated facts contained in this luminous report. The man interested in the soil who can review those facts without foreboding is a dull clod without intellectual perceptions. The statesman, be he Radical or Conservative, who is indifferent to them is beyond the pale of national appreciation. Is there any method by which we can divest them of the unfortunate prejudice which a majority of our Parliamentarians attach to them in order that they may stamp themselves with searing force on the national mind?

Could not many Radicals be persuaded that there are not a few suggestions in this report which they could heartily accept?

BIRMINGHAM CATTLE SHOW.

Championship again goes to Windsor His Majesty's Shorthorn Steer
Wins—Champion Sheep, Sir R. P. Cooper's Shropshires—
Berkshires Win Pig Challenge Cup.

Visitors to Birmingham on Saturday found a keen north west wind that was blowing far more reminiscent of fat cattle shows than the muggy conditions of earlier in the week. Bingley Hall itself was the same aspect as is familiar to frequenters at these Christmas shows, and it was difficult to realise that another year had sped its way. The show was of a good all round character, although there was nothing of distinctive merit. Entries were up to an average. Cattle numbered 171, sheep 60, and pigs 68, a total in the live stock section of 299. Of agricultural produce there was a capital collection, the entries of corn totalling to 76, roots 148, and potatoes 89, or a total of 313.

parts, and as regards ripeness is well brought out; he scales 16 cwt. 1 qr. The second prize one was bred and shown by H.M. the King, from the Windsor herd, and is well covered with heavy flesh and good quality; his symmetry standing upon very short legs is also pleasing; he is the got of Iron Duke, and pulls up the scales at 16 cwt. 0 qr. 13 lb. Mr. Lawton Moore secured third honour with a steer by Bonanza, heavier than either of the preceding, very ripe, and a good-backed, heavily-fleshed animal. Mr. Loarner's big steer that was second in the any breed class at Norwich, was reserved, and the he was also given to Mr. A. C. Hughes for a still heavier steer of

17 cwt. 2 qr. 15 lb., and a c to Mr. J. F. Grahites for a very good one completed the class.

On the steers under two years Mr. James Edwards bred and exhibited the best, a good-coated one, with capital back and ribs, sired by Challengeer, 14 cwt. 2 qr. 11 lb. Sir J. R. J. Cotterell followed with a good-fleshed and level steer by Ramewes. Mr. H. F. Russell was third with a straight son of Soudan, reserve went to H.M. the King, and he to Mr. Peter Coats for very useful entries.

The five entries of females were headed by H.M. the King's Camilla, a massy, level-fleshed, beautiful-quality holder by Earlfield, weighing 15 cwt. 2 qr. 8 lb. Mr. Thomas Morris's Symbol, also level in flesh and outline and very firm to the hand, was placed second, the orange curd being placed over the Earl of Coventry's Gavel, reserve to Mr. Peter Coats' Pearl, and he to Mr. Lawton Moore's Brampton Agnes 33rd concluded these honours, the special prize for best of the breed being accorded to Mr. Coats' steer, and reserve to H.M. the King's Camilla.

Shorthorns.

For several years past the Shorthorn classes have been so despoiled of high class males owing to the unprecedented demand experienced perpetually for the highest class of bulls for export, that it is only when some individual either fails in pedigree or colour to suit the somewhat whimsical tastes of these extensive foreign buyers that one can expect to see a really top male Shorthorn in the fat stock classes; whilst by the same rule females are not sacrificed upon this altar except when by some reason they fail to breed. It therefore goes for saying that a first-class show of Shorthorns at these fat stock shows is never anticipated, and much more money comes into the pockets of our breeders as the effect of this. Under these conditions it is a great credit to the breed that out of what may be called its drafts a steer should be produced capable of carrying off and that fairly the championship of all breeds at this show; yet such was the case, this great honour falling to H.M. the King for a steer from the Windsor herds, by the great sire Royal Duke out of Jenny Lind B, and like all other exhibits from the Royal herd this steer was bred by his Majesty. Apart from this, the show of Shorthorns is rather moderate both in numbers and merit, fewer steers, and few in number also females, and the older steers count up eight entries only. Beginning with this latter section his Majesty's steer is placed first, a similar position to that he occupied a year ago at this show in the junior class since when he has gained remarkably well in weight, and vastly improved in symmetry and general contour, he now scales 18 cwt. 12 lb., which he carries freely with great activity and in the least possible compass—a pretty sure indication of solid flesh rather than excess of fat. He has filled up in his thighs wonderfully during the year, and his bone and chine as well as shoulders are capitally covered; and as regards ripeness, he is done to the proverbial turn. He is just under the age limit of three years, and must be reckoned as a Shorthorn of considerably over average quality as well as breed character. The second-prize steer in the class was exhibited by Captain H. L. Townshend

SHORTHORN STEER.

This Shorthorn Steer won the First Prize in the class for a Steer of any breed bred and fed in Norfolk, not exceeding two years' old, at the Norwich Fat Stock Show last week. It is the property of and was bred by H.M. the King, Sandringham, and is 1 year 10 months old. Its sire was Royal Carlisle 84584, dam Squall.

The various sections will be found dealt with in our critical report in the succeeding columns.

Herefords.

The Whitefaced cattle of Herefordshire have always been first favourites with the feeders and butchers of the Midlands since their right to priority in the catalogue of the great Birmingham Christmas Fat Stock Show. The display this year was much of an average as regards numbers, for which the older steer class was more numerous filled than usual; that for steers under two years old was not quite so well supported, and females were a fair entry and of better quality than usual. This satisfactory remark as to quality of the females, however, cannot be repeated in full as it respects the two classes of males, which, though in the main capital beef, more evenly fed and less of patchiness than we sometimes see, still leave a little to be desired in the way of style and general character. Those visitors to Birmingham, however, who were privileged to see the splendid classes of young bulls of this breed at Lord Tredgar's show at Newport last week will at once recognise the why and wherefore of this very trilling complaint, and it is much better that these splendid prospective sires should have remained entire to go into all parts of the world as they will do to perpetuate the admirable beef producing properties of their breed than to have been sacrificed as steers. In a fat stock exhibition it is better for all sections of the world-wide community that it should be so, and the drain upon the best Herefords for export has been going on for a long period with every prospect of continuing. Steers over two, and not exceeding three years, had a catalogue entry of eleven, of which there was certainly nothing of the outstanding quality of his Majesty the King's champion steer at last year's show, yet the first prize steer in these, bred and exhibited by Mr. W. H. Cooke, and sired by Centurion, is well covered on his loin and ranging

CROSS-BRED STEER. DANESFIELD BLUE BOY.

The Cross-bred Steer, Danesfield Blue Boy, was First in the class for a Cross or Mixed-bred Steer above 2 years and not exceeding 3 years old, at the Norwich Fat Stock Show last week, and Reserve in the older Steer Class at Birmingham on Saturday. It is the property of and was bred by Mr. R. W. Hudson, Danesfield, Marlow, Bucks, and is 2 years 10 months 1 week 5 days old. Its sire was Danesfield Jester 18949 (Aberdeen-Angus), dam Shorthorn.

and bred by Mr. Finlay Munro, Roekfield Farm, N.B., his sire Maxwell, and dam by Regular. He scales somewhat heavier than the winner, and like him has done remarkably well since last year, when he contested the honours with his more favoured opponent in the junior class with similar results to the present class, and with equally close running for then as now, the second steer stood first for some considerable time, and last year, it will be remembered, that the positions of the two steers were reversed at the Smithfield Show the following week, a circumstance that may possibly occur again, as the Caldecote steer is big and has put on his greater weight of flesh remarkably even, carries himself well, and is very perfect in respect of symmetry, he has also a capitally covered top of roasting beef; his handling at Birmingham is just a little against him, the travelling having probably upset his nerves, which in animals, as in the human race, makes a great difference. Mr. R. W. Hudson occupied the third place with Dancesfield Masterpiece, that was similarly placed at the Norwich show recently, he was bred by the Marquis of Exeter and sired by Baron Wrexham. Since Norwich he has certainly held himself together well, and with good top and perfect fitness he will hold his place. His weight is 17 cwt. 0 qr. 27 lb. The ups and downs of show cattle and judging give reason for considerable interest, and bring out the ideas of different judges in a marked fashion sometimes, and so it is at Birmingham this year, for Miss A. de Rothschild's steer by Waddesden Youth that stood second at Norwich now follows Mr. R. W. Hudson's steer for the same place. He is very gay and full of quality and symmetry and also scales well. Yet more remarkable is the fate of Mr. E. T. Turner's first-prize steer at Norwich, which at Birmingham has to stand below both his Norwich opponents, and has to pass out with only a modest card. This is a massive, short-legged, well-fleshed, and weighty steer, bred by Mr. John Cran in the North, but his journey appeared to have deprived him of some bloom in appearance, and so he had to suffer defeat, a card was also dealt out to Messrs. Silkcock and Son and Sir John Swinburne for very good steers in the class.

Steers not exceeding two years old were only three in number, the first and third prize ones being bred and exhibited by Sir Oswald Mosley, Bart., and the second prize one bred and shown from the Royal herd at Windsor. The Windsor steer is the heavier one of the three, being 13 cwt. 2 qr. 20 lb., and is a good roan in colour, sired by Lord of the Isles, and is just under the two years in age; he is lengthy, and a good fleshed one, and with another year may fill up in his back, and come out a better animal. Sir Oswald Mosley's first prize one is two months younger and is first-rate beef, well matured and good in his hind quarters and chine, he however scales but 12 cwt. 1 qr. 15 lb., whilst the third prize one from the same herd by Diplomatist is still lighter and lacks growth, otherwise a very symmetrical nice quality steer all over. The first prize one is a son of the good getter Beauty's Pride.

Cows or heifers send but four representatives, the best of which very decidedly comes from the Windsor herd, this is H. the King's Red Rose by Royal Chieftain out of Rose of the Vale, a young heifer of two years and seven months, scaling just upon 14 cwt., and very shapely and full of sweetness and Shorthorn style, in symmetry she meets you wonderfully well, and is capitally covered with the best quality of beef coming out very ripe, second prize was awarded to Sir R. P. Cooper's Leighton Princess 17th, bred by the late Mr. J. Naylor, sired by Banner, and scaling 15 cwt. 2 qr. 11 lb. after having had one live calf; she is very massive, level, and evenly fed. Mr. E. T. Learner's Luckadain, which was first in her class at Norwich, comes in third; she was bred by Mr. John Ross and sired by Ajax, and has plenty of good flesh and quality as well as shape, and pulls up the beam at 15 cwt. 0 qr. 8 lb. The Shorthorn champion prize, we may add, was awarded to H.M. the King's champion steer, and the reserve to the first prize heifer Red Rose, also from Windsor.

Devons.

The effect of reducing the amount of prize-money in the Devon section has had the curious result of stimulating rather than decreasing the number of entries of the Red cattle from the west country. In fact, it is many years since the Devons made such a fine display at Bingley Hall. In the class for steers exceeding two and not exceeding three years old, there were just half-a-dozen exceedingly choice animals. First prize went to a very heavily fleshed steer that should constitute a rare body of beef when hung up; it turned the bridge at close on 16 cwt.; it was bred by Mr. William Russell, Synton, Scotch Midland, Devon, and exhibited by Lord Rosebery, Marquis of Leighton Buzzard, who was also placed second with a smaller but well-fed steer that was not quite so good in the butts as the other. It was bred by Mr.

John A. Loosemore, Fisher's Downs, South Molton. The reserve went to Mr. Thomas Kidner, Norwich, with Curly, bred by Mr. Abraham Tribble, Holsworthy, North Devon. It is a rare butcher's bullock, but scarcely a show one, and as such supply a vast quantity of juicy lean meat. A highly commended card was given to Viscount Portman's Gay Lad from Bryanston Blandford. It was a very firm steer, but not quite even enough for a higher position. The same exhibitor sent Reggie for a commended card, only it was rather more attractive to the eye than the other; though it was weighty it did not handle so well. Mr. T. S. Morgan's Goodfellow, from Whimple, Devon, was also commended. It was rather leggy, rather light forward, and a trifle inclined towards coarseness. There were five steers in the class for not exceeding two years old. Here Mr. T. S. Morgan came in first and reserve for the special breed prize with Whimple Model, a very level, even, smart steer, with a grand loin rather on the small side as compared with some of the others, its live weight being 10 cwt. 2 qr. 7 lb. It is well bred, going back to that celebrated dam Ringlet, and should with care come out again in the older class next year. Second prize went to his Majesty the King with a very firm fleshed steer with good loin, but lacking at the end; reserve went to Lord Rosebery with a very weighty youngster bred by Mr. Joseph Yendell, Heasleigh, Devon. This steer had a capital loin, but did not continue good to the tail, had it done so it would have gone higher; highly commended went to his Majesty the King for a steer that was a bit leggy and did not handle at all mellow. Commended card was bestowed on Viscount Portman's Fancy that was excellent in front, but did not continue so even.

The females always make a small class. On this occasion there were only three to grace the lists. The first prize and special breed prize was bestowed on His Majesty the King's Caroline, which was a perfectly finished three-year-old; it was truly as round as a barrel, and full of meat without blubber; it was a triumph of Devon feeding, and she should do well at Smithfield. Mr. T. S. Morgan supplied a capital second in Whimple Beauty 3th, which was very pretty, but just wanted a little more finish. The reserve went to Viscount Portman's Coronet, bred by Mr. R. W. C. Evered, Spaxton, which was the first prize taker in her class at the Devon County at Tavistock this year. She is a very deep heifer with a good back and loin, but a wrinkle over the rump marred her chances.

Aberdeen-Angus.

A total of seventeen entries of this breed in the three classes allotted to them at Birmingham cannot be called an excessive entry, neither is the quality quite up to what we sometimes see in this breed, as we have been accustomed to look for the champion very frequently in this section; however, though there is nothing of a sensational character in the section this time, the whole of the lots are practically good beef beasts, well brought out and mostly very good in shape, as is customary with them. The first class for steers exceeding two and not exceeding three years of age contained five entries, the post of honour being somewhat keenly contested between a capital steer of his Majesty's breeding from Aberdein Main, the get of Blendsquare, exhibited by Captain J. L. Townshend, and a steer of Ballindalloch blood shown by Mr. James McWilliams. It was not until the services of the umpire had been requisitioned that these steers were placed in the above order. The first steer has gained immensely in weight since he was exhibited in the junior classes a year ago, and now pulls up the beam at 17 cwt. 1 qr. 9 lb. with a ripe, good body of beef thoroughly filled in the roasting parts and heavy for his age. The second bullock is very even in flesh and symmetry, and is considerably better, but to the eye, and whilst he has a little advantage in age he loses in weight over the winner more than 2 cwt. Mr. R. W. Hudson was the exhibitor as well as breeder of the third prize steer, which was a great favourite for the higher position at the ring side. He was looking in excellent bloom after championing the male section at Norwich previously. Mr. E. P. Alexander also exhibited a very neat and good beef steer.

Steers not exceeding two years were headed by one of Mr. James McWilliams, by Alick of Aberlour scaling 13 cwt. 2 qr. 15 lb., a very level topped, good quality one that eventually carried off the special prize for best Scot. Mr. R. W. Hudson followed with the very compact and symmetrical as well as good beef steer Dancesfield Negro 2nd, and the reserve was accorded Mr. J. J. Criddle for a massive, well-shaped one of his own breeding by Wizard of Malenore; he and a card were awarded to entries of the Rev. C. Bolden, the Duke of Darbham, and a second entry of Mr. L. W. Hudson's.

Four were six in number, and were a good lot. First honour was accorded Mr. J. R. Findlay's Pride of Honour, a massive, level fleshed cow, but rather showing the effects of having had one calf, whilst the maiden heifers shown by Mr. J. J.

Criddle and Mr. E. P. Alexander came in with more bloom and quality, and were also very nice in shape, though both were lighter in weight considerably; these were placed second and reserved in the order written.

The Aberdeen-Angus section is classed also in connection with the Galloways at Birmingham, so that these classes follow. There were three steers competing, shown by Mr. T. B. Earle, Mr. Alfred Palmer, and Sir John Swinburne, and though not tig, the animals weighed fairly well, and must be classed as first-class beef. The honours were dispensed in the above order. One female of this breed was present, a very symmetrical, fine, beef heifer, shown and bred by Mr. Alfred Palmer.

Galloway.

This highly-esteemed Scottish breed had only three steers and one heifer in the organised classes, but several Galloway crosses were in the Butchers' Classes. Mr. T. B. Earle's first-prize steer was very full shaped and carried a good body of beef. Mr. Alfred Palmer's Jock, which won second prize, was also a well-shaped, good one. Mr. John Swinburne took reserve. The heifer, which had a walk over, was Mr. Alfred Palmer's Lady West 4th, small in stature but very level.

West Highland.

Two very handsome steers with formidable antlers and shaggy coats were the Earl of Durham's Willie and James, which took the prizes. In the female class, Sir John Swinburne was to the front with Nellie, to which two nice animals belonging to Mr. Chas. Bell were second and reserve.

Welsh.

This breed was in good force with eight two-year-old steers, four yearlings, and five females. The Coal Coch Trustees were first in the older class with an animal of excellent quality and substance, scaling rather over 17 cwt. Second and third to him came shapely animals belonging to Mr. Robert Hughes, the third winner being far heavier than the second. The yearling steers were headed by Mr. Graves' Wern Dog Rose, which had an excellent middle piece. The University College of North Wales won the second prize and reserve, Mr. R. Robert won first and second prizes in the female class with very well-shaped nice heifers, Mr. K. Hughes getting reserve.

Butchers' Prizes.

The butchers of Birmingham and district endowed, as usual, two classes with prizes, the first being for animals of any breed or age exceeding 13 cwt. Sir W. Corbett won the first prize with a lengthy polled animal scaling 7 lb. over 19 cwt., but a very firm handler. Second to him came Mr. R. W. Hudson's Dancesfield Black Watch, a cross between Aberdeen-Angus and Shorthorn, which has come out an animal of good substance and firm flesh. Third prize was won by Mr. A. B. Dryburgh for another Aberdeen-Angus cross, although not so heavy a one, but a very firm handler. The beast which won the prize for being heaviest of any animal in the show was in this class, belonging to Mr. R. Jones, a Salop exhibitor, his weight being 4 lb. over 21 cwt. In the class for best butchers' beast, not exceeding 13 cwt. Mr. R. C. Nash brought from co. Dublin, Lucan Put of the Aberdeen-Angus Dexter Cross, of a rare quality, to win first prize, Mr. J. G. Green, of Warwickshire, winning the cross between Hereford and Shorthorn, not made too fat, but which would furnish nice cuts of saleable character. The Duchess of Newcastle came third with Miss Sheen, a nice heifer of the Aberdeen-Angus Kerry Cross.

Extra Stock.

There were ten animals in the class for extra stock, and Mr. E. P. Alexander was first with a full-shaped Aberdeen-Angus cross, Viscount Trefgarne being second with a much heavier one of Hereford character, and Mr. W. Corbett was third with a nice Red Pol.

The Cattle Championships.

It is not often that the very important champion prizes at the Christmas Show of the Midlands are so quickly dispensed as was the case at Birmingham on Saturday last. During the morning's judging proceeded, and class after class, breed after breed had appeared before the judges and the public, it was generally agreed that the championship of the entire show would practically rest between H.M. the King's best Shorthorn, the first prize aged steer, and Mr. L. W. Hudson's first prize cross-bred heifer Dancesfield Honey Bee, as the other sections had nothing to offer so worthy of these great trophies as the two animals named, and as both were in the hands of their breeders, matters were somewhat simplified, as the breeder's prize accompanied the other honour (exhibits). Eventually decisions were in favour of the Shorthorn with the Angus cross as reserve, and the award was generally well received, the champion honours thus falling to the Royal Shorthorn with the Breckers' Champion from the Elkington Challenge Cup, the Thorley Challenge Cup, and the Welsh Challenge Cup.

The Birmingham Daily Post Challenge Cup for best beast, not exceeding two years old in the various breed and cross bred classes, was awarded

to Mr. James McWilliams' Aberdeen-Angus steer, and the reserve to Mr. T. S. Morgan's Devon steer under two years.

Sheep.

The woolly tribes have seldom if ever made a better appearance at a Birmingham show. The class for Southdown wethers was headed by a pen of superb character from the King's Sandringham flock, and a second pen therefrom had reserve. The second and third prizes were for pens of very choice character from the late Colonel McCalmont's flock, and the Duke of Devonshire's pen was the.

The Shropshire wethers were of extraordinary merit. Sir R. P. Cooper winning first and second prizes with good matching sheep, well made out. Mr. Victor Cavendish, M.P., sending from Holker two pens which were third and c, that of Mrs. W. F. Ingo getting reserve, and Captain Townshend's pen was the.

The Oxfordshire wether class had four pens, the first of which was that of Mr. J. G. Hobbs's Maisiehampton, grand in character and substance, the three sheep scaling 9 cwt. 20 lb. Mr. John Hazell won second prize with very even nice quality wethers, the reserve pen of Miss Alice de Rothschild being also of excellent character.

The Hampshire wether class was commended entire, two superb pens belonging to Mr. James Flower, of Chilmark, winning the prizes. Sir W. G. Pearce obtained the reserve. Mr. T. F. Buxton being the other exhibitor.

In the any other breed class two good pens of the Ryeland breed, belonging to Mr. W. T. Barneby, won the prizes, and the cross-bred pens, shown by Mr. E. Bostock, the reserve.

Lamb Classes.

Southdown lambs had eight pens, and H. M. the King won first and third prizes with two of them, they being divided by one of the pens of the Exors. of the late Col. McCalmont. The reserve in this class went to Mrs. Montefiore. The Shropshire lambs were not so numerous, but were very good. Sir R. P. Cooper was first, and Mrs. W. F. Ingo second and reserve. In the class for Oxford lambs Mr. John Hazell came quite to the front by winning first and second prizes; Mr. J. H. Precoe obtained a third, and Mr. W. H. Stilgoe reserve.

Hampshire lambs had a dozen pens, so good that the class was commended entire. Mr. James Flower again came to the front with some remarkably nice specimens, the second and third prizes being obtained by Sir W. G. Pearce and Mr. S. Darling, while Mr. T. F. Buxton obtained reserve. In the class for other pure breeds or cross-breeds, Mrs. Montefiore's Hampshire Southdowns were preferred for quality to Mr. J. A. Precoe's more weighty Hampshire Shropshires, but the heaviest lambs in the class was the reserve pen of Mr. Bostock of the Hampshire Oxford cross, they pulling down the scales to 5 cwt. 2 qr. 11 lb. It was worthy

of remark that in the extraordinary good class of Hampshire lambs not one of the twelve was under 5 cwt., the heaviest being one of the pens of Mr. S. Darling, which scaled 5 cwt. 3 qr. 9 lb.

Pigs.

This year the pigs were indeed a feature at Birmingham, most of the breeds being well represented. In the class for Berkshires not exceeding nine months old, Mr. Lawrence Currie, Farnborough, Hants, was first with a very even pair, a perfect match; and the same exhibitor's second prize lot was scarcely a whit inferior. Mr. Nathaniel Benjafield, Dorset, was reserve with a pair that were not quite so evenly finished. The Tamworths were three pens only, but they were good. Mr. Robert Ibbotson, Knowle, Warwick, was both first and second with lengthy pigs with capital coats. Mr. G. G. Lancaster's reserve lots not looking quite so well out of the pens as in them. The Large Whites made a splendid class of eight entries, and the competition was keener. Mr. Alfred Hughes was first with a pair well let down in the hams with plenty of profitable meat; second went to Mr. John Riddell, Timperley, these were very close up. Mr. Albert Green, Droitwich, was third, but his two pigs were not quite so matching as the others, the reserve went to Mr. Philip Baker, Shirley, his pigs were not quite so fine to a finish. The Middle Whites made a very small class, first prize went to Mr. G. A. Fricker, Mere, Wilts. These pigs had capital backs and loins, Mrs. S. Green, Droitwich, was second with a most meritorious pair. Mr. N. Benjafield's pair not being so even.

Maturity told in the elder classes for pigs exceeding nine and not exceeding twelve months old. The whole of the Berkshire class was noticed by the judge. Mr. Fricker was here placed first with a model pair of good length. They were as even as though moulded, and their hams came right down to the hocks, there not being an ounce of bone more than was necessary. So, in addition to their class prize, secured the Hotel and Innkeepers' Challenge Cup, value 20 guineas, which has to be won three years by the same person before it becomes his property. This cup was won in 1900 by Mr. N. Benjafield, in 1901 by Mr. J. A. Fricker, in 1902 by Mr. A. Brown, in 1903 by Mr. N. Benjafield, in 1904 by Mr. A. Brown, in 1905 by Mr. R. Ibbotson. So it will be seen that three exhibitors are on a level with two wins each to their credit. Second prize in this class went to Mr. N. Benjafield for a pair of pigs with plenty of bloom. Reserve went to Mr. A. Brown, whose pigs did not walk so well. Mr. Tricker obtained the third prize. The Duchess of Devonshire was highly commended with a pair of weighty pigs, but not quite deep enough. The Tamworths again made a class

smaller in numbers, but of good quality. Mr. John Myatt was first with lengthy, well brought out pigs. Mr. Robert Ibbotson's second prize pen were very long and of nice quality, but needed more weight; Mr. E. Hailes' reserve were very fleshy. The Large Whites again made an excellent class, Mr. Alfred Brown's pen being very matching with most of the best; Messrs. Litting's second prize were possessors of very neat loins. Mr. Alfred Hughes, Knowle, was third; his pigs were rather heavy on the shoulders. Mr. Bothwell was reserved, his pigs not being so matching. The Middle White, or Small White, constituted a rather uneven class. Mr. Alfred Brown sent a pair of Middle Whites very even, and showing well for bacon; these were put first and reserve for the challenge cup. Mr. A. C. Twentyman was second, and Mrs. S. Green and Sons reserved. The crossbred class was one of the best in the show. The first prize went to Mr. Arthur Brown with very fleshy pigs, Middle White and Berkshire Cross, and he was second with another pen of a similar cross. Mr. J. A. Fricker came in third for a weighty pair of Large White and Berkshire cross; reserve went to Mrs. S. Green and Sons, the cross in this case being Large White and Tamworth, Mr. N. Benjafield being highly commended. The butchers class for two fat pigs not exceeding twelve months old brought out an entry of fourteen. Mr. N. Benjafield being first with Middle Whites; Mr. W. Midwinter, Birmingham, second, also with Middle Whites; the reserve going to Mr. Lawrence Currie with Berkshires, Mr. A. C. Twentyman's highly commended lots being Middle Whites. The total of pigs entered was sixty-eight.

Corn, Roots, Potatoes, &c.

The corn samples were rather more numerous than sometimes, fourteen samples of barley competing, of which the two prizes went to Mr. H. B. Horwood for Carter's Prolific, and to Mr. T. C. Horn for Carter's Chevalier. There were twelve samples of white wheat, and Mr. Horwood again took first prize with Carter's Rough Chaff, Mr. F. A. Smith being second with a variety called Essex Long-eared Rough Chaff. In the red wheat class having nineteen entries Mr. R. W. Hudson was first with Manitoba, Mr. R. C. Gurney second with Carter's Imperial White Oats, had sixteen samples, Mr. E. Hailes getting first prize with Garton's Universal, and Mr. Thos. Frith the second premium with Garton's Abundance. There were seven samples of black oats, and Mr. T. Frith was first with Garton's Rival, Mr. S. Timmis second with one of Webb's varieties. There were only three samples of beans; Mr. D. H. Wills was first with Webb's Tick, Mr. Horwood second with Carter's Heligoland. The samples of peas were five in number,

RED POLLED STEER.

This Red Polled Steer won First Prize in the class for a Steer of the Red Polled Breed not exceeding 2 years old, at the Norwich Fat Stock Show last week. It is the property of and was bred by Sir W. Corbet, Bart., Acton Regnold, Shrewsbury, and is 1 year 10 months 1 week 4 days old. Its sire was Albert 7789, dam Acton Tulip 14424.

and both prizes went to Carter's, Mr. Horwood winning the first and Mr. H. Purser the second.

The Root classes commenced with the contest for the Proctor and Kyalund's Silver Cup for the best collection of long manget, globe manget, and swedes. Mr. John Perry, Oswaldkirk, York, won with very fine roots from Webb's seeds, Mr. Alfred Franklin, Worminghall, Oxon, getting reserve, also with Webb's seeds. The last-mentioned won Webb and Sons' Silver Cup for long manget, Mr. John Perry winning their other silver cup for any other kind of manget grown with their seeds. In the open class for long manget Lady Wantage won with heavy roots from Sutton's seeds, Mr. John Perry being second with other fine ones grown from Webb's. The open class for globe or intermediate Wurzel varieties had no fewer than thirty-five entries. Lady Wantage obtained another first with Sutton's prize-winner Yellow Globe, Mr. Alfred Franklin being second with one of Webb's varieties. The Kohl Rabi specimens were very first class, especially Mr. John Perry's first winning one of Webb's Green and Mr. H. Marshall's second prize lot, which was from Sutton's seeds. In the competition for Messrs. Webb and Sons' cup for the best samples of their Imperial swede, Mr. John Perry won another first prize, and he also succeeded in carrying off both first and second prizes in the open class for swedes, which had no less than thirty-two entries with Webb's seeds. For common white-fleshed turnips his Grace the Duke of Portland was first and reserve, and Mr. W. Watts won second prize, the whole of the lots being from Sutton's seeds. The yellow-fleshed turnips were equally good, and Mr. W. Aitken, a Scotch grower, won both prizes with Webb's Invincible, which also secured reserve for the Earl of Portsmouth. The Duke of Portland's Belgian carrots were very good, but they only obtained second prize.

There were ten classes of potatoes, and Mr. D. H. Wells, Tysoe, Warwickshire, won four of the first prizes, besides some of the subordinate ones. The Duke of Portland won three first prizes, Mr. James Needham two firsts, and among other winners were Mr. Thos. Bannister, Mr. John Perry, and Mr. E. S. Wiles. The total entries of corn, roots, and potatoes were 313.

CHAMPION AND SPECIAL PRIZES.

SILVER CUP.—A Silver Cup of £25, Champion prize for the best animal bred by the exhibitor.—H. M. the King, Windsor. Shorthorn steer, two years eleven months three weeks old, weight 18 cwt 0 lb 12 lb; reserve, Mr. J. W. Hudson, Daneshield, Mallow, cross-bred heifer, Daneshield Honey Bee, two years eleven months one week, weight 15 cwt 3 lb 10 lb.

Erlington Challenge Cup. value 100 guineas, for the best animal.—His Majesty, Shorthorn steer; reserve, Mr. Hudson's Daneshield Honey Bee.

Thorley Challenge Cup. value 100 guineas, to the breeder of the best animal.—His Majesty; reserve, Mr. Hudson.

Webb Challenge Cup. value 100 guineas, for the best animal bred by the exhibitor.—His Majesty's Shorthorn steer; reserve, Mr. Hudson's Daneshield Honey Bee.

Birmingham Dairy and Cattle Show. value £40, for the best animal under two years.—Mr. J. McWilliam, Stoneymount, Mullion, Keith, Aberdeen-Angus steer J.P.; reserve, Mr. T. S. Morgan, Whinlup, Exeter, Devon steer Whinlup (heifer, Laura).

Maiseneau Park Challenge Cup. value £50, for the best Aberdeen-Angus.—Mr. J. McWilliam's J.P.; reserve, Mr. J. R. Hargray, Aberdeen, heifer, Red Bull, Angus (steer).

Silver Cup. value 10 guineas, for the heaviest beast in the Show.—Mr. R. Jones, Newton, Bognor, weight 21 cwt 0 lb 4 lb.

£25 for the best Hereford.—Mr. W. H. Cooke, Stanford Bridge, Worcester; reserve, His Majesty, Windsor (Camilla).

£50 for the best Shorthorn.—His Majesty, Windsor (steer); reserve, do (heifer, Laura).

£10 for the best Devon.—His Majesty, Windsor (heifer, Caroline); reserve, Mr. T. S. Whimble (steer, Whimble Model).

£20 for the best Scot.—Mr. J. McWilliam (Aberdeen-Angus steer, J.P.); reserve, do (heifer, Red Bull, Angus (steer)).

£25 for the best Welsh animal.—The Coal Coal Trustees, Abergele (steer, Gwilym); reserve, Mr. R. Roberts, Portmadoc (heifer, Laura).

£30 for the best Crossbred.—Mr. R. W. Hudson (Daneshield Honey Bee).

SHEEP.
The Cooper C. alliance Co. gave of 25 guineas for the best pen of Sheep.—Sir Richard P. Cooper, Shenstone Court, Lichfield (Shropshire wethers); reserve, ditto.

£5 for the best Hampshire.—Sir Richard P. Cooper (wethers); reserve, ditto.

5 guineas for the best pen of Hampshires.—Mr. James Fowler, Chirnash, Salisbury (wethers); reserve, ditto (rams).

2 guineas for the heaviest pen of lambs.—Mr. Sam Darling, Beckingham, Wilts (Hampshires); weight, 5 cwt 3 lb 9 lb.

PIGS.
Challenge cup, value 20 guineas, for the best pen of pigs.—Mr. J. A. Frick, Burton, Mere, Wilts (Berkshires); reserve, Mr. Alfred Brown, Hill Farm, Southampton (Middle Whites).

JUDGES.
Hereford, Devons, Welsh, Kerries, and Extra Stock.—F. M. Maude, Crichel, Wiltshire; Christopher Williams, Egham, Surrey; John Hereford, Shortons, Scots, and Crosses.—T. W. Garrie, Alderley, Cheshire; G. H. G. Walker, Rosedale, Elgin, N.B.; Butchers' Priests.—H. Patterson, Acocks Green, near Birmingham; J. H. Ryndon, Kingston, near Birmingham; F. W. St. Edward, Ladywood Road, Birmingham.

SHEEP.
W. Barrs, Tenpe, Atherton; Allan Cooper, Norton, Bishopcote, Levens; L. Lambart, Balaunham, near Cambridge.

PIGS.
T. S. Minton, Montford, Shropshire; Butchers' Priests.—A. Marsh, Brierley Hill, Staffs; C. H. Falchetter, Dudley Port.

PRODUCE.
Corn.—F. H. Ludlow, High Wycombe, Buckingham; W. T. Rushton, Aston Road, Birmingham. Roots.—R. G. Patten, Acton Hill, Stafford; F. H. Yates, Weard, Lichfield. Potatoes.—W. Halliday, Patshull Gardens, Wolverhampton; G. Worthington, The Gardens, Guy's Cliffe, Warwick.

THE FAKING OF CIDER.

Harmless Additions to Improve Appearance—Flavourings—Adding CO₂.

In a natural state no one can disavow the assertion that cider is the purest beverage on earth. Water may be subject to contamination as it percolates through the soil, but the juice of the apple is collected from the soil by means of innumerable rootlets; it is filtered by passing through many feet of wood ere it reaches its position within the skin of the apple. This is washed by the pure rains of heaven, nurtured and developed by means of the sunshine, and then, if this is crushed and put in clean barrels, we have a pure liquor of high dietetic as well as medicinal value. This medicinal value in the old days was too apt to be most commonly associated with most nauseating, nay stomach-expellant, drugs, inasmuch so that even the word "medicine" became repugnant to the average individual of the human species. But modern practice has recognised virtues in pleasant foods for medicinal purposes. Foods, instead of being conglomeration of foods, each now has its specific individual action.

So has cider; it has been proved to be a gentle though very effectual diuretic, and by means of its action on the kidneys it removes many ills that take up their origin from those important organs of the human anatomy. Thus we find the uric acid removed, rheumatism and gout cleared out of the system; the malic acid is supposed to thwart the designs of typhoid fever, and, above all, cider is a pleasant and thirst-quenching drink, as well as being an appetiser. Thus it will be seen what a high position cider takes for consumptive purposes.

Until recent years cider was not made so good as it might be, but generally, however badly made, it had the merit at least of being pure. If harsh and unpalatable as a drink, except in the cultured farmer and his labourer, cider was a country beverage. But improved methods of making produced a far more pleasant and palatable beverage, and then a big demand was created in the towns. This was most profitable to the cider maker, and through him to the cider apple grower. The one has improved his apples and the other his cider. It was indeed a home industry, as flourishing as the green bay-tree. But like all good things, it attracted at first the eye, and then excited the cupidity of the "faker." Here was a grand opportunity. Cider or cyder was a popular name for a popular beverage, but it was not recognised by the inspectors. Under the Food and Drugs Act the farmer must have 3 per cent. of fat in his milk and not over 16 per cent. of water in his butter. But the cider faker could sell anything as cider so long as he could persuade the general public it was such. The position has thus become so intolerable that the cider-makers have taken the pure cider question up in earnest, and will endeavour to obtain special legislation if the present means are not equal to stopping a detestable traffic—a parasitism on a legitimate industry.

Firstly, it will be well to draw attention to what may be called faking, for the improvement of cider, or the so-called making it marketable. Now usually a glass of claret is much more attractive than a glass of say hock, and to overcome the predisposition of aversion against the latter, coloured glasses are used. Thus what meets the eye, or rather what the eye does not see, the heart will not wish. But some ciders have a greenish, whitish appearance. To overcome this and to give a little density, cane sugar was formerly burnt in a saucepan until it became a syrup of rich dark hue. This was then mixed in a bucket of cider and turned into the head of the cask, but there always remained a burnt taste. Then came the beetroot movement. A couple of beetroots were boiled and sliced, and then put in a thin muslin bag and inserted through the top bung-hole and remained inserted in the cider. Others used quite a large quantity of large, long, red manget. The water in which these were boiled was also added to the cider, the sugar in the manget was by fermentation turned into alcohol, and a tremendously heavy beverage was the result of a very bright red if the pulp was allowed to remain in too long and settle as "grounds" or "muck" at the bottom of the cask. Very often a highly undesirable flavour was set up, but so long as it warmed his stomach and dazzled his head the old-time labourer did not mind. It will be seen so far the endeavour was to improve apple juice by giving it colour and density.

Soon, however, the chemist, by means of a preparation of annatto, supplied cider colour in a cheaper and more readily available form than by either of the before-mentioned methods. No matter how thin the ciders, the rich red colour was there, and this struck a heavy blow at the naturally red ciders of Somerset, where the pommace is oxidised and the tannin imparts the characteristic colour.

Next came what may be styled body improvers, many of which were more imaginative than real in their action. In these we may include malt. It was supposed to afford something for the acids in the cider to feed upon; the secret here was, of course, the sugar, which had been obtained by maling. Another though more reprehensible practice was to put manna or treacle in the cider, or, decomposed without imparting any virtue whatever, and was undoubtedly the cause of many deaths by ptomaine poisoning. But this is seldom practised now. Another item was to boil parsnips, and put water and root alike into the cask. It must be admitted that this does improve the body and appearance of the cider, but, at the same time, the characteristic apple flavour is lost and that of parsnip wine replaces it.

Now there is one thing used with their ciders or rather with the juice as it comes from the press of low gravity; this is by means of the addition of pure cane sugar. This will of course be converted into alcohol by the ordinary fermentation, and a very high grade cider will result; but unless the juice is carefully tested by means of the hydrometer, and the requisite proportion of sugar added, it does not come off as the improver desires. The yeasts which convert the sugars into alcohol can only live up to a certain percentage of alcohol, and when this is attained they are killed by their own efforts. Thus, if an excess of sugar has been added this remains unconverted, and remains as a sweetening addition, and in this form is readily detectable on the tongue of an expert. The addition of sugar cannot be regarded as being harmful, and we have used it with the fakes and makes on pure apple juice of all degrees of quality, all of which are supposed to have a tendency to increase the body or density of cider, though some of them have a double purpose.

Next we have the flavourings. There are proprietary articles, such as caramels, generally with a good basis of sugar. Old gingerbread is also used for this, but very often it is slightly too piquant. Boiled hops, with the water in which they are boiled, are used for bringing up low quality cider. But in the majority of instances it is only a sweetener that is desired, and this generally takes the form of tar, sugar or saccharin. The intense sweetness of this is abhorred by all cider judges. It hangs about the jaws, and it practically spoils a judge's palate for a long time. So powerful is it that the worst-made, hard acid ciders, nay, cider vinegars, may have their most reprehensible features effectually disguised by means of this saccharin. It has no food qualities whatever, and its use should be prohibited. A glass of hard cider, even if sweetened, has a most deleterious effect on a delicate stomach. The acid will be taken up by the blood, and the drinker be filled with excruciating rheumatic pains, for which he is totally unable to account until he consults a medical man, and after that he ceases to be a cider drinker any more; and, what is more, he deters others from drinking it by recording his experiences. This hard cider in the heat of summer often sends the labourers, that by usage should be immune, to the village doctor. The saccharin may be harmless enough in itself, but it is what it masks that does the harm. It is never used with good ciders; these have no need of it whatever.

Another class of faker may be the carbonator. But here the line has to be very sharply divided, because undoubtedly the addition of a little CO₂ at the time of bottling greatly improves the appearance of any heavy cider, and the juice poured from the bottle, and it also has valuable preservative effects. Such is one side of the line; the other is that by its means cider can be watered down nearly to a vanishing point and yet seem to have a flavour, as the gas reaches, cleans, and sprays the tongue; in fact, this so-called cider is little more than gassed water, the sale of which a few years since did much to bring the bottled cider trade into disrepute. But this point will be dealt with more fully later, where cider is sold as tectotal cider. Outside flavours may be imparted by putting the apple juice into freshly emptied wine casks, brandy hogsheads, rum puncheons, &c.; but though these may be condemned by some, they are appreciated by others, and cannot be deemed harmful, as they impart a very attractive flavour to what might otherwise be an undesirable cider, though the cider makers of old always put their best apple juice in such casks. Still, the custom does not prevail now, as the judges at shows have set their faces against this practice of what they most rightly consider to be an artificial flavour.

Now we have to come to what may be termed the harmful manipulation, or faking, of the cider or the juice, and to state that it is absolutely injurious to the public health. Firstly comes the use of preservatives.

SHOWS.

Tredegar Show.

Viscount Tredegar's agricultural show was opened at Newport on Wednesday in brilliant weather. Practically all classes are open, and some of the best animals in the country are attracted to the show, at which £23,500 was offered in prizes.

Nearly every well-known breeder of Hereford cattle was represented. Cameronian, belonging to Captain Heygate, of Leominster, added another to his already long list of successes, and beat Endale, the property of Mr. P. Coats, of Sheepcote, Clifford. Rob Roy took premier honours for Mr. W. Tudge, of Kington, in the yearling class, but there was not much to choose between his nominee and Pertout, belonging to Mr. J. H. Dent, Stoke Edith, Hereford, or Old Sort, the property of Sir J. Cottrell, Bart., of Carnons, Herefordshire. The bull calves were not up to the usual standard. In milking cows, Ivington Plum, the property of Mr. A. E. Hughes, of Wintercott, Leominster, was an outstanding winner. The heifers were good all round. Brampton Agnes 33rd, belonging to Mr. L. Moore, Brampton Brian, Hereford, was easily first in two-year-olds.

In Shorthorns, old bulls provided keen competition, the winner, Linkfield Champion, the property of Mr. F. Miller, of Birkenhead, having carried off premier honours at the Royal, Bath and West, and other shows. Linkfield Champion also took the champion prize for the best male horned breeding animal in the show. Sir R. Cooper's Meteor was placed second. The yearlings were exceptionally strong in numbers, and Mr. Fred Phillips, Mayor of Newport, took second prize with Salperton Rugel, which ran the winner, Mr. Freeman's Master Donald, very close. For bull calves the blue ribbon went to Walton Victor, bred by Mr. W. Hazell, Aylesbury, a promising youngster. Local breeders were not so successful as usual. The prize for the champion female horned breeding animal went to Lord Calthorpe's Sweetheart.

The trials for Hunters took place at Coedkernew, near Newport. In the heavy-weight class, Mr. J. H. Stokes's Whiskey was first, and Colonel Hon. F. C. Morgan's Courtenay second. The entries in the light-weight class were scarcely up to the standard. Here, again, Mr. Stokes won with Mottcau, who went well all round, Mrs. Tatem's mare Queenie being second. The jumping was witnessed by a large crowd, which included Viscount Tredegar.

The agricultural horses were an exceptionally good lot, though not quite so many in numbers as usual. In the cart classes Sir P. A. Muntz captured four firsts. Dunsmore Premier beat Lord Tredegar's Thornbury Drayton in the two-year-old cart colt class, and in the yearlings Dunsmore Pearl Drive was placed in front of Mr. F. C. Tomkins's Brimfield Forest King. The other Dunsmore winner was Brockhall Lioness in the two-year-old cart filly class, which beat Mr. J. Ferneynough's Moumow Belle. Sir A. Henderson showed the best cart mare in Ivy Fashion. The winners in the local classes were Mr. Phillips, Coedkernew, near Newport; Mr. T. Lewis, Llangeby; Mr. E. Lewis, Blackwood.

The ponies, hacks, and Hunters were the best ever seen in the Tredegar Show. For Hunter brood mares the prize went to Geisha, belonging to Mr. H. R. Evans, Staunton-on-Arrow, Hereford. Mr. W. J. Tatem's Penylan Ormerod was the best three-year-old, and Penylan Docker the best two-year-old. The champion cup for yearlings went to Miss L. Clay, Chpepstone, with Petrolite. The winners in the hack and colt classes were Mr. Williams, Penrhinweiber, Mr. W. J. Tatem, Mrs. Henigan, Cheltenham, and Miss Lindner, Ledbury.

Chippenharn.

The seventy-first annual exhibition in connection with the Chippenharn Agricultural Association was held as usual in the market yard on Thursday. The comparative statement showed the total number of entries 522, against 514 last year. The family class was the most attractive in the cattle section, the number of entries being considerably above the average. In the fat classes the committee has this year reduced the age by six months. The classes for fat steers and heifers were weak in point of numbers, but the quality was excellent, the champion animal, exhibited by Mr. Alexander, being found in the class for fat steers under three years. Local farmers have for several years complained that they are placed at a disadvantage by having to compete against what they describe as "professional breeders," and to meet their wishes the milk classes were confined to exhibitors residing within a radius of twenty miles of Chippenharn. Considering that there are thousands of dairy cows kept within the area, it is not encouraging to the committee to find that four reserved classes only produced eighteen entries.

In the sheep department two classes were confined to local farmers, and here again the result was disappointing. Horses were strongly represented, the show of cart mares and foals being particularly attractive. There were some good pens of pigs. Cheese and butter were of exceptionally good quality, the fancy designs being most artistic.

SHOW GOSSIP.

H.M. the King will be in town for the Smithfield Club Show.

The prize schedule of next year's Hackney show, which takes place as usual at the Royal Agricultural Hall, Islington, on March 5, 6, 7, and 8, has just been issued by the Hackney Horse Society from its office at 12, Hanover Square, W. To complete the schedule a class has been added for the best pair of ponies under 14 hands, any age, prizes £10, £5, £5. The schedule now efficiently caters for horses of every age and height, both in hand and in harness. The total of cash prizes and challenge cups offered is £1,711 as compared with £1,685 last year. Arrangements have been made for the better accommodation of the carriages used in the harness competitions.

In 1908 and future years stabling will be provided for 700 horses, and the size of the ring will be increased to 255 ft. by 75 ft. The seating will

Mr. H. NICHOLS,
Sec. West Gloucester Farmers' Club.

also be considerably extended and many other important improvements effected. The last show was an extraordinary success, and the most satisfactory of the series. Representatives from America, Austria, France, Holland, and principal countries were in attendance. Trade was very good, and altogether some of the best horses were sold for export. Steps as usual will be taken to make the details known to all the principal horse-men abroad. Entries close on January 14, and with late fee on January 21, and applications to the secretary for prize schedules, forms, or other particulars will receive immediate attention.

The Derby Local Committee held their final meeting at Derby last week. Sir Edwin Ann presided, but the Duke of Devonshire was unable to be present. The total amount of subscriptions received was £5,773, and there was a balance in hand of £123, which it was decided to hand over to the Derbyshire Agricultural Society, who did not hold their show.

The annual report of the Poulton and District Agricultural Society states that the sum paid for admission to the show ground, which was at Blackpool this year, was about £110 more than was received the previous year, when the show was held at Poulton, and the grand stand receipts were £18 more, but there was a falling off in subscriptions of £47. The total income amounted to £874, as against £738 last year. Though the receipts were greater, the additional expenditure more than counterbalanced the increase, as about £80 more was given in prizes, the fitting up of the showyard and the grand stand cost £25 more, and

the expenses on show day were £15 more. On the year's working there was a profit of £8 9s. 10d. The balance in favour of the society is now £120. A new feature introduced at the show this year was the sheep dog trials, which were a great success.

At the annual meeting of the Barnstaple Agricultural Association, Mr. C. Pearce, vice-president, in the chair, the secretary, Mr. J. Smale, reported that the result of the year's working was to increase the debit balance by £17. Mr. L. H. Alford said the setting-off was accounted for by lessened gate-money, despite the fact that they had an ideal day. He believed there was a larger question affecting the success of the society, due to the society's operations having been considerably extended, this having alienated local sympathy.

The Devon County Agricultural Association wrote suggesting that as the County Show was being held at Bideford in 1907, it was advisable to forego the Barnstaple Show in the coming year. Mr. A. F. Selton remarked that they had an adverse balance of £28, and under all the circumstances he moved that they forego their show for 1907. Mr. R. B. Sanders seconded. Mr. J. Copp proposed that the show be continued, but held on August Bank Holiday, instead of in the second week in July, which was a much too early date. Mr. G. Brown seconded Mr. Copp's motion, which was agreed to.

At the annual meeting of the Oxfordshire Agricultural Society it was stated that the accounts for the year were very satisfactory, and the Henley meeting proved a financial success. The Right Hon. Viscount Villiers was elected president, and Sir Alexander Henderson, Bart., president elect. The annual show will be held at Binbury next year on May 14 and 15, for which there is a very strong local committee formed, and we hope this meeting will be a most successful one.

DAIRY.

Chester Cheese Fair.

On Wednesday, pitch about 35 tons; good attendance of buyers. Prices: Finest, 76s. to 80s.; medium, 70s. to 75s. A few lower grades down to 65s. A good clearance.

Farmers and Butter Fat.

Mr. C. Crowther, M.A., Ph.D., of the University of Leeds, has just issued a pamphlet dealing with variation in the composition of butter fat, arising out of the case that came before the Skipton Petty Sessions in April last, in which a farmer was accused of having adulterated his butter with nearly 34 per cent. of margarine fat.

On that occasion the evidence adduced on behalf of the defendant proved beyond doubt that the butter was perfectly genuine, since further samples prepared on his farm under strict supervision gave on analysis by different chemists practically the same figures as those on which the West Riding County Analyst had based his certificate of adulteration. In other words, the supposed adulteration of the butter must have taken place before the milk left the udders of the cows, or as it has been expressed, the butter was apparently adulterated with margarine through the cows. Such a conclusion, if true, was, of course, calculated to arouse grave misgivings in the minds of butter producers.

In order, says Mr. Crowther, to ensure as far as possible the production of butter rich in volatile acids (present as fats)—in other words, butter that shall not be liable to be regarded by the analyst as adulterated, but which, indeed, in respect of the volatile acids, shall be well up to or above the average for genuine butter—the butter-producing farmer is recommended to pay special attention to the following points:

It is particularly important that the times of calving of the different cows should, as far as practicable, be spread over the twelve months.

Every attention should be paid to the comfort and regularity in the treatment of the animals. In particular, care should be taken to protect them from adverse climatic conditions or sudden and repeated changes of temperature.

When oil-cakes are fed to the cows the quantity should never much exceed 4 lb. per head per day. This precaution is especially important during the later stages of lactation when the milk yield is small.

A meeting of directors of the Scottish Chamber of Agriculture will be held at No. 5, St. Andrew Square, Edinburgh, on Wednesday, December 5. Business:—1. The Land Tenure Bill as amended. 2. Letter from Free Improvement of Chesham Cattle Association. 3. Proceedings of the Board of Agriculture.

CORRESPONDENCE.

Preserving Eggs in Water-Glass.

Sir,—During September I placed in water-glass eggs, some of which are good whilst others have not kept fresh. The water-glass, after being mixed with boiling water, was placed in an open earthenware pan on a stone floor.

Where is "silicate of soda" prepared?

Does it deteriorate by keeping?

Is any better substitute available?

For what length of time can eggs usually be preserved in a fresh state with water-glass?

Should the eggs be covered by 1 in. or several inches of the liquid?

Or should the open pan be replaced with a closely-covered pan?

Can any readers of your newspaper advise me?

—Yours faithfully, JOHN GEORGE VAIZEY.
Braintree, Essex, November 26, 1906.

The Land Tax.

Sir,—Re my letter, "A Farming Candidate's Programme," which appeared in your influential paper on October 29, 1906. No. 1. "An entire readjustment of the Land Tax; that is to say, tax the land at its present value. The tax should be a sliding one, as land is very apt to go up and down in value, as the case may be."

Now the question of taxing the land is a very important one, and with your permission I should like to go a little further into the matter. In the first place there is nothing in connection with the law upon which people are less informed than the Land Tax.

The Land Tax was first imposed in the reign of William and Mary, between the years 1689 to 1702, and it was only supposed to be levied for a year. However, it was re-enacted from year to year until it became a permanent charge. Naturally enough, the land was taxed according to its value. For instance, at that time Lancashire was of small value and of little account, so it was assessed at £20,000, but now the value of property in Lancashire has increased a hundred-fold, but still the land tax is just the same, £20,000, a mere farce, nothing more or less.

Again, the St. Pancras district was very poor in the days of William and Mary, and the land tax was less than a farthing in the pound. Now a foot or so in that district is a gold mine in itself, but the tax is just the same to day as it was over 200 years ago—less than a farthing in the pound. On the other hand, land that was in a highly prosperous state in those days was taxed from 8d. to 1s. 6d. in the pound according to value. But those once populous and thriving districts, now of little account, are called upon to pay the same high tax as if they were in the height of prosperity.

The Land Tax in this country is a mockery and a farce, and a sweeping resolution and entire readjustment of the Act are absolutely necessary. And this question should be one of the first in the minds of all those who have the interest of the farming community at heart.—Yours faithfully,

J. H. C. WOODRIFFE.

November 26, 1906.

A Calving Curiosity.

Sir,—A most extraordinary thing happened in my cowshed on the evening of the 17th inst.

One of my cows calved a healthy bull calf, which from its appearance as to size, hair, &c., evidently came to its proper time, according to service on February 8, as booked; and about three hours afterwards calved another perfectly-shaped calf, but without hair, and about the size of a new-born lamb, apparently about four or five months before its time. Have any of your readers experienced a similar case, or can your M.R.C.V.S. account for it?—Yours truly,

A. J. R.

November 19, 1906.

Protection of Seed Against Rooks.

Sir,—Will the editor kindly send me, or insert in next edition of MARK LANE EXPRESS, the receipt for dressing corn to prevent rooks from eating it. I cannot find my edition of October 22.—Yours truly,

E. A. M. T. FISHER.

Welby Warren, Grantham, November 23, 1906.

[The following, extracted from our issue of October 29, will give our correspondent the information which he seeks.]

"The employment of coal tar is practised for this purpose with success. A solution of 2½ oz. coal tar, 2½ oz. petroleum, mixed with one quart of water per bushel of wheat, can be recommended. The following treatment is adopted on a large farm in France, where the treated wheat escapes damage, although serious injury is caused by crows to neighbouring fields, notwithstanding the fact that the birds are continually being scared. The solution is made as follows: 1½ pints of coal tar, 7½ pints of petroleum, 1½ pints of carbolic acid, to 5 qrs. (or 480 lb.) of seed. The proportions named should be strictly

adhered to in order to obtain successful results. Commercial carbolic acid of full strength must be used. The mixture should be made as follows:—Place the coal tar in a pot on a slow fire until it is quite hot and shows signs of boiling, remove it from the fire and add the petroleum whilst stirring, and finally the carbolic acid. The mixture should be thoroughly well stirred, and it will remain quite liquid after cooling.

"In order to treat the grain about four bushels of seed should be spread out on a water-tight floor, and a tenth part of the mixture, poured on it. This must then be stirred up quickly till each grain is blackened and the whole is about the colour of roasted coffee. Continue in the same way, dealing with about four bushels at a time.

"The seed cannot, however, be sown in this condition, as it would stick to the cups of the drill, and in order to remedy this add to each four bushels of seed about two pints of phosphate of lime. When mixed, the grain will be completely dry, and can be sown in the ordinary way. Seed treated in this way will not be touched by crows, though the growth may be retarded by some two or three days. The cost per bushel would be insignificant."

The Colony System of Poultry-Keeping.

Sir,—Since the publication by this society of my report on "The Poultry Industry in America," the result of observations made in Canada and the United States during the past summer, a considerable amount of attention has been drawn to the colony system of keeping both laying and young stock, as evidenced by the inquiries and communications I have received. Believing that this method, should it prove equally successful in this country, which may reasonably be expected, cannot fail to lead to a greatly increased production of eggs and poultry, and will solve some of the difficulties of farmers and others, more especially in hunting and the more difficultly populated districts, I bespeak the hospitality of your columns for the opportunity of answering some of the questions asked. Details as to the methods adopted in America will be found in the report, and need not be repeated. The question is, how far is the system suitable under our conditions?

It is, however, of importance to understand that what is practically the same method as to principle has been carried out for many years in connection with duck-raising.

It is unnecessary to consider at length, in connection with what may be termed special poultry establishments, how far the system can be applied. Much depends upon the amount of land available. Generally speaking, we may accept that under these circumstances it can be recommended without hesitation, provided that there is enough ground to permit absolute change year by year, the sections vacated after use by fowls for one or two years being cropped before they are occupied by the poultry again. In this manner land can be much more heavily stocked than has hitherto been deemed desirable. If each plot of field is thus used only once in year, three, all danger of taint in the soil would be avoided, and the crops secured should be much greater than if the land were stocked on present lines. I have no hesitation in saying that the colony system will do much for increase of special poultry establishments as a part of the operations, and contribute greatly to their success.

This is, however, a farmers' question first of all, and valuable though the system referred to may be in the direction already indicated, I am convinced that there is thus offered a way by which poultry-keeping in relation to general agriculture can be enormously increased. At the same time, where poultry are of minor consideration, and risks from loss by enemies—biped or quadruped—very small, the employment of portable houses, which have increased so enormously in this country of late years, is to be preferred, as they can be linked with the ordinary rotation of farm work without interference with or displacement of any other part of the work. Any check to the development of what is a most valuable system is to be greatly deprecated. For such farms, the colony system offers no advantages at present apparent.

Many farmers, however, either as a result of risks of loss, or of special cropping, or of labour, or of desire to extend beyond the capacity of portable houses, have sought for other methods. To such the colony system should be of immense value. In districts where special protection is unnecessary, all that is required will be to give up a field entirely to the poultry for one or two years as the case may be. On pastures it will be better to adopt the single-year rotation, not using the ground again for fowls for two entire seasons. On arable land the birds can be kept thereon during

two years, if thought necessary, afterwards cropping for at least two whole seasons. On pastures 100 birds can be kept to the acre, and on arable land 200; but in the latter case I should suggest, until further experience has been obtained, that the ground be only occupied one year before removal. If occupied two years it will be safer at first to keep 100 to the acre. Where protection against foxes or other enemies is necessary, then the ground under use by the fowls should be enclosed by wire netting, running a plough round the boundary before the fencing is erected so as to sink the netting below the level. This fencing will entail an expense of, say, £10 for one acre, £15 for two acres, and £20 for four acres, but cannot, under those circumstances, be avoided. The houses used should hold not more than twenty-five birds in each, and four or eight per acre, as the case may be, will require to be distributed over the ground in convenient positions.

Although I feel confident as to the future of the colony system of poultry-keeping, it has yet to be fully tested in this country, and I am glad to say that arrangements have been made by the University College, Reading, for a careful series of experiments both as to the keeping of laying hens and the rearing of chickens on this plan, with a view to the training of its students and seeing how far the system is suited to our conditions.—Yours faithfully,

EDWARD BROWN.

12, Hanover Square, W., November 26, 1906.

Forestry: Continental Experts and the Zurich System.

Sir,—You were good enough a few weeks ago to publish some extracts which I gave from Herr Stadtförster Ulrich Meister's admirable work (in German) on the forestry operations in Zurich, where the municipal authorities have taken into their own hands the manufacture of raw material. I find, however, that although some few continental experts agree that the system is well managed and produces good results, they do not advocate its general adoption.

Dr. Riebel, *Königl. Oberförster* (Royal Chief Ranger in Hanover-Münden), with whom I have just had a correspondence, deals *inter alia* with this point.

"We in Germany," he says, "have many urban and rural communes which possess forests, many of them of very large extent, and whose accounts show a large revenue earned in easement of rates from the utilisation and sale of the raw products, thus securing very substantial results for the business. Industrial activity in the country districts can, in my opinion, be better fostered and furthered by providing small private undertakings with an adequate supply of useful raw material (*branchures Rohmaterial*) than by the erection of concentrated municipal or communal workshops. The State as well as municipal and other authorities had better, I think, restrict themselves to the raw production in the woods they have charge of, and leave the industrial exploitation to private undertakings. Industrial trades for the treatment and utilisation of the raw products are more suitable for the domains of private forest owners, particularly those on an extensive scale. I think I may venture to pronounce an opinion on this subject, as I myself have had in my hands for many years the active management of a large private forest, coupled with that of widely-ramifying, scientifically-worked industrial trades. (*Mit sehr intensivem Viel-seitigem Gewerbebetriebe.*)"

M. Ch. Broilliard, of the Haute Saône (who, as will come from a communication of his published in your issue of the 18th ult., is one of the great authorities among French sylviculturists), agrees with the German specialist; and I think it will be generally admitted that, under the present conditions prevailing in England, these views will find most acceptance here. But in any case, the first thing to be done is to substitute, for the present haphazard arrangements in this country, a more scientific and systematic treatment of our national woods and forests with a view to their better cultivation and utilisation in the public interest.—Yours faithfully,

CHARLES HANCOCK, B.L.
Reform Club, S.W., November 29, 1906.

Fruit Growers and American Gooseberry Mildew.

—After a lantern lecture by Mr. E. S. Salmon, of the South-Eastern Agricultural College, Wye, Kent, on November 21, to the members of the Herefordshire Association of Fruit Growers and Horticulturists, a resolution was carried as follows:—"The members of the Herefordshire Fruit Growers' Association, being alarmed at the appearance of the American gooseberry mildew in England, and in the adjoining county of Worcester, and seeing the destruction caused by the disease to the gooseberry crops of other countries, call upon the Board of Agriculture to prohibit the importation of gooseberry trees and such ribes as are likely to be infected in this country, and to secure the destruction of all infected stock."

## POULTRY.

Poultry-Keeping in America.—Prices Obtained for Eggs.

(Continued from page 564.)

Mr. Brown next turns to a consideration and also a description of the Colony House system, concerning which so much has been said and written of late. The next chapter is headed "Egg Production in Canada and the Western States," and in this much interesting information is given. As for the price obtained for eggs, Mr. Brown says that these are low, and adds:

When, as is the case at some seasons of the year, Western eggs are sold in New York at 17 cents (8½d.) per dozen, it will be understood that the producers do not obtain very much. In Burlington, Iowa, early in July, I found that the shipper's price was 13 cents (6½d.) per dozen, and in St. Joseph 12 cents (6d.) per dozen, which means that, taking into consideration the expenses of collection, in many cases the farmers cannot be receiving more than 8 to 9 cents per dozen. Under these conditions it is only where the greatest economy is practised in management, and the birds are allowed to find a large part of their own living, that the trade can be profitable. But that it is profitable no one seems to have any doubt whatever.

Even in the winter seasons prices are low, not rising in Missouri above 15 cents per dozen, and very little has been done for the production of winter eggs; in fact, under such conditions it can scarcely be expected that farmers will take much trouble in securing eggs during the colder months of the year.

The trade done is on an enormous scale. I was informed by the S. P. Pond Co., of Keokuk, Iowa, one of the largest firms in the West, that they ship about a quarter of a million cases of eggs per year, each case holding 360 eggs. From April to June they handle about 60,000 cases a month, and at the time of my visit there were sixteen testers at work. There is no grading carried out except for very small ones, the testing being entirely as to quality.

The size of the eggs is low, the bulk running to 14 or 15 lb. per 120, and thus we have reproduced almost entirely the same set of conditions as found in eastern and southern Europe. This great firm have sixty buyers who visit local towns within 100 miles east, 45 miles north, and 200 miles west of Keokuk, purchasing both eggs and chickens.

Other firms handle on a smaller scale, and I learnt that in Nebraska, Colorado, and Arkansas there has been an enormous growth in the trade, whilst in the State of Texas the development of poultry-keeping was very great indeed in the future. It is recognised, however, that these supplies are of a low grade, and I cannot see for long period of time anything else can be expected. It is quantity not quality all through.

As regards

PRICES IN CANADA,

Mr. Brown says:—At the time of my visit I found that in the district around Montreal 16 to 17 cents per dozen (8d. to 8½d.) was being paid in the country districts. This is an enormous advance upon what was the case five or six years ago, when the regular price was 8 to 9 cents (4d. to 4½d.) per dozen, and the same evidence was given to me in the different districts of Canada visited.

The reason for this is that there has been an enormous increase in the local demand, and the home consumption has gone up very greatly. There is, however, another explanation. Prior to the passing of the McKinley Tariff Act some years ago, large quantities of eggs were shipped from Canada to the United States, and it was owing to that Act that exportation to England was taken up. Within the last three or four years there has been a great influx in the western sections of Canada of settlers from the United States. These settlers are of a very fine type—experienced farmers with money able to buy what they want. They have taken farms and are now engaged in the work of developing their new occupations. The stage has not been arrived at when they can touch poultry or keep fowls, and as a consequence there has grown up within the period named an enormous demand for eggs from Western Canada.

Thus, as the prices paid are good, vast quantities of eggs are shipped from Ontario along the Canadian Pacific Railway to points beyond Winnipeg. In process of time the reproduction in these new provinces will increase, and an opportunity is offered to settlers who understand poultry-keeping in British Columbia and other parts of the west. At the present time, however, the demand is vastly greater than the supply.

(To be concluded.)

At Frome November fair on Wednesday there was a good supply of cattle, fresh barreners particularly, the best making £10 to £14, inferior, £7 to £8. Old cows sold badly. In-calfers, £11 to £16; storks, £8; good yearling bulls up to £18. A capital supply of horses and ponies. Cart-houses made £42 to £50.

# Fertilisers and Feeding Stuffs.

## USEFUL INFORMATION FOR FARMERS WHEN BUYING.

### Approximate Unit Cost of Fertilising Constituents.

It is necessary for guidance in the economical use of fertilisers, and especially in the purchase of Complete and Special Manures, that the relative unit cost of the principal fertilising constituents should be studied: the subjoined table affords information on the subject. By multiplying the guaranteed minimum percentages of a fertiliser by the unit costs given in the table, the buyer will get a good idea of the commercial value of any chemical manure offered to him. The unit values are subject to variations from time to time, and in this respect we shall endeavour to keep the table up to date, besides which, buyers living in remote districts may have to pay a little more for heavier cost of delivery. If credit is required, this will also add to the cost.

| Potash (pure) ... ..                                 | 4 0                | 4 0          | 4 0                    | —                | —                     | —          | —                | —           | —                | 4 0              | 3 10    | 4 0                  | 3 10               |

N.B.—The above table is based on the commercial cost of the fertilising constituents. Agricultural value is not always synonymous with the commercial cost, and every farmer must exercise his judgment, while considering the cost, which fertiliser may be expected to give the most profitable return on his soil and for his crops. This is the cheapest manure for him.

### Approximate Unit Cost of the Nutritive Constituents in Feeding Cakes and Meals.

June, 1906.

**Cakes and other Feeding Stuffs.**—In order to be able to form a correct opinion of their value, it is necessary to know the relative cost of the different nutritive constituents. The following note, by an eminent authority, supplies this information. By reference to it, a farmer can calculate out the approximate commercial value of a cake or meal, and then use his judgment as to which is most suitable for his special requirements.

Albuminoids ... .. s. d. s. d.  
Oil or fat ... .. 2 8 to 3 0  
Carbohydrates ... .. 2 8 to 3 0  
1 1 to 1 2

NOTE.—Most authorities in England are agreed that the value of each per cent. or unit of albuminoids and of oil is at least 2½ times that of 1 per cent. or unit carbohydrates. If, therefore, the percentages of albuminoids and oil in a feeding stuff be respectively multiplied by 2½ and added to the percentage of carbohydrates, the total feeding units contained in the article are obtained. The cost of the feeding stuff divided by this total of feeding units gives the price per unit. Example: A cotton cake contained

|                            | Per cent. | Feeding units. |
|----------------------------|-----------|----------------|
| Albuminoids ... ..         | 22.1 ×    | 2½ = 55.2      |
| Oil ... ..                 | 5.2 ×     | 2½ = 13.0      |
| Carbohydrates ... ..       | 33.2 ×    | 1 = 33.2       |
| Total feeding units ... .. |           | 101.4          |

The price of the cake being £5 7s. 6d., the cost per feeding unit was just about 1s.

### Note to Regular Subscribers.

We may remind our readers that we are prepared to analyse free of cost for our regular subscribers, who are farmers, and not in trade as vendors of fertilisers or feeding stuffs, samples of minimum lots of 2 tons of either article, in cases where there is solid reason to suspect an attempt to defraud. The analyses are published, under a *nom de plume*, in the paper.

We are also willing to publish replies in these columns to inquiries relating to the quality and use of fertilisers and feeding stuffs.

### Feeding Experiments with Pigs.

The following instructive remarks on the subject of pig-feeding are taken from the evidence of the managing director of the Wiltshire Bacon Curing Co., given before the agricultural Committee of the Tariff Commission—

“From 1896 to 1900 a long series of experiments on pig-feeding was carried out under the auspices of the Wilt County Council, and it was then ascertained that the best results were attained by the use of barley meal combined with dairy produce, while the use of maize was found to be most undesirable, except where sparingly used in conjunction with other foods. Pigs fattened on maize are worth from 20s. to 30s. per cwt. less than those fattened on barley meal. Were we dependent on pigs fed on maize meal the industry of bacon-pig-feeding would practically cease to exist, as in the face of the present competition nothing but the very best quality of bacon would have the best chance of surviving. So great is the difference in the value of pigs fed on maize compared with those fed on barley that it would never pay the feeders to rear pigs on maize in preference to barley.”

Weeds, like the poor, are always with us; they sometimes come when least expected and consume the nourishment intended for the cultivated plants. It is the duty of every farmer to eject them from his property with all the energy at his command.

### Comparative Railway Rates.

The following extract from the report of the Agricultural Committee of the Tariff Commission shows how much higher the cost of carriage in cakes and fertilisers is in this country than on the Continent—

| Examples of Rates.             | Oil-cake. | Packed Manure. |
|--------------------------------|-----------|----------------|
| London to Maidstone, 41 miles  | 3 1       | 3 0            |
| Equal distance in—             |           |                |
| Germany ... ..                 | 2 10      | 2 10           |
| Belgium ... ..                 | 2 10      | 2 10           |
| Denmark ... ..                 | 2 9       | 2 9            |
| France ... ..                  | 2 6       | 2 6            |
| London to Nottingham 125 miles | 13 4      | 10 10          |
| Equal distance in—             |           |                |
| Germany ... ..                 | 5 7       | 5 7            |
| Belgium ... ..                 | 4 7       | 4 7            |
| Denmark ... ..                 | 5 6       | 5 6            |
| France ... ..                  | 5 6       | 5 6            |
| London to Liverpool 201 miles  | 17 6      | 15 9           |
| Equal distance in—             |           |                |
| Germany ... ..                 | 8 3       | 8 3            |
| Belgium ... ..                 | 5 7       | 5 7            |
| Denmark ... ..                 | 7 1½      | 5 6            |
| France ... ..                  | 10 6      | 6 2            |
| London to Newcastle, 272 miles | 19 2      | 19 2           |
| Equal distance in—             |           |                |
| Germany ... ..                 | 10 4      | 10 4           |
| Italy ... ..                   | 14 11     | —              |
| London to Aberdeen, 523 miles  | 30 0      | 30 0           |
| Equal distance in—             |           |                |
| Germany ... ..                 | 19 6      | 19 6           |
| Denmark ... ..                 | 9 10      | 7 8            |

It will be noticed that the railway rates compare very unfavourably for the former in this country, and a combined effort should be made to remedy this evil.

The consulting chemist of the Royal Agricultural Society reports that during the twelve months of 1905 the number of samples tested by him for members of the society was 571, being 41 in excess of the previous year. For the current year the number up to date is 507. For the Derby Show, analyses of selected samples of cider and perry were made at the society's laboratory, and also a large number of milk analyses in connection with the awards in the milk trials.

### Phosphatic Manures.

Superphosphate and basic slag are the most important. In the Board of Agriculture's leaflet on the subject it is stated that—

Superphosphate is more suitable under the following circumstances—

- Where rapid effect is wanted.
  - In spring.
  - For arable land.
  - For admixture with sulphate of ammonia.
- Basic slag is specially suitable—
- For use in autumn.
  - For use on grass land.
  - For land holding much peat or other vegetable matter.
  - For use on land addicted to finger and toe.
  - For use in orchards.
  - For admixture with nitrate of soda.

### When is the Fat in Milk Likely to be Low?

According to experiments the morning milk of a herd may frequently be under the standard of 3 per cent. of fat when milking takes place early in the afternoon to allow of the milk being retailed on the same day. An effective plan is to milk at equal intervals, and when milking must take place early in the afternoon, it is very desirable to again milk in the evening, refrigerate the evening milk and mix it with that of the following morning. It may be thought that this cannot be done owing to the refusal of milk to rise under the circumstances, but tests show that there is in this no real difficulty. The morning milk will be distinctly better in quality though less in quantity if evening milking follows early afternoon milking.

The forms of the materials used for fertilisers must be carefully considered. Quickly growing crops, such as cereals, should be supplied with quickly acting fertilisers, whereas this is not so necessary with crops that take a longer time to arrive at maturity.

The soil cannot be expected to produce satisfactory crops unless it is well furnished with plant food. The wise farmer will not let his crops suffer from insufficient nourishment any more than he will let his stock suffer from hunger.

## Manurial Experiments on Grass Land.

In the introduction to the report on above subject, issued by the Agricultural Department of University College, Reading, it is stated, and it is a fact on which too great stress cannot be laid, that much of the grass land in Great Britain, through constant cropping and grazing without adequate application of suitable manures, has been robbed of most of its available constituents, and it is a problem of supreme importance to determine what is needed and how to supply these needs economically.

To obtain reliable information on this important matter the Agricultural Department have carried out a series of experiments, designed with the object of illustrating the influence of the chief artificial manure used singly and in combination, and also to determine what is the most efficient and most economical dressing to apply to the grass land of the country.

The detailed results are recorded in the bulletin before us; they are too voluminous for insertion, but the general conclusions, as follows, are instructive:—

**Basic Slag** has generally shown good effects in improving both the quality and quantity of the produce. Its greatest advantage was seen where a good plant of clover was present which responded remarkably to the stimulus of the phosphate. The want of effects of basic slag in many cases may be due to the fact that it was applied too late in the season.

**Superphosphate** was applied instead of slag at two farms where the soils are lighter, and in each case it gave a better return than basic superphosphate.

**Kainit** had little or no visible effect on the heavy soils, but on the lighter soils of gravelly and sandy nature its value was striking when applied with phosphates of nitrate. Its full effect is only obtained when used in conjunction with nitrate or phosphate.

**Basic Super**.—There was no visible improvement on any of the plots dressed with this manure until after the rain we had in June, after which there was a marked improvement, especially in the clovers; we may see some good results from this manure in the aftermath. On one estate it gave the best return.

**Nitrate of Soda** has generally added to the quantity of grass and has given some good results where it was used with a potash or phosphatic manure, but where applied alone it was not generally a success; however, at two places it has given a good return.

Comparing the manured with the unmanured plots, there is in almost all cases a considerable gain on the first year in spite of the unfavourable weather, and there is the lasting effect to consider in addition to the increased value of the aftermath.

It will be interesting to notice the result from the farm dung in future years. So far, it has given a poor return when we take into account the cost per acre.

Owing to the variation of the dryness of the grass when it was weighed, the ratio of the grass to the hay was variable.

## Woburn Experimental Station.

The Royal Agricultural Society report that the experiments conducted at their Woburn farm continue to show very interesting results, and that the farm had been visited by a larger number of people than in previous years. The effects of the use of lime in the farm soil are, in particular, very forcibly illustrated. Trials of different varieties of clover and lucerne are also in progress. As with the harvest of 1906 thirty years' work will have been completed, the occasion is thought opportune for the modification in some way of the continuous wheat and barley experiments with the view of making them simpler, and bringing them more into line with practical farming. At the pot culture station the experiments have been carried a step further, and other experiments on inoculation for leguminous crops have been undertaken for the Board of Agriculture. It may be mentioned that the Royal Agricultural Society was awarded at the Milan Exhibition a "Grand Prix" for an exhibit illustrating some of the principal features brought out in the Woburn Field Experiments.

## New Sources of Nitrogen.

At the recent meeting of the Paris de Aznare Nitrate Company, the chairman, referring to possible fresh competition to nitrate of soda, said, "as regards competition it has now become clear that, in addition to the more active competition of sulphate of ammonia, we shall have competitors in the producers of nitrogen from the atmosphere by means of water power and electricity. There is no doubt that nitrogenous substances are now being produced from this source on a commercial scale, and to a certain extent they must interfere with the demand for nitrate of soda for chemical purposes." This new source will gradually bring down the price of nitrate for agricultural as well as chemical requirements.

## Artificial Supply of Nitrogen Necessary for Wheat.

The evidence afforded by the Rothamsted experiments, as well as the results obtained in practical farming, prove beyond question of doubt, that if full crops of grain are to be produced, it is essential to give the crop the advantage of an artificial supply of nitrogen, and experience has proved that this supply should be furnished in a readily available form. The most effective substances are nitrate of soda, sulphate of ammonia, and soluble guano. Nitrate of soda acts more quickly than anything else, and in general may be considered the most suitable for cereals, but if the unit cost of nitrogen in it is relatively much dearer than in sulphate of ammonia, then the preference may be given to the latter, bearing in mind that it should be distributed over the soil a month earlier than would be suitable with nitrate of soda.

In districts subject to heavy rainfall, such as the western and south-western districts, and Ireland, it may be asserted with good reason that sulphate of ammonia is the safer fertilizer to use, as nitrate is liable to be washed away before the young plants have been able to absorb the nitrogen in it. On light lands soluble guano will often give the best results, and can be strongly recommended for barley, as it supplies nitrogen combined with mineral plant food, and thus exercises a favourable effect on the quality of the grain.

## Fertilisers for Asparagus.

In an interesting article on "Asparagus Growing in France," appearing in this month's *Board of Agriculture Journal*, it is reported that the manures which have been found most effective are well rotted dung, town sewerage to which is sometimes added sea salt, lime, chalk and marle, and sulphate of ammonia, muriate of potash, superphosphate of lime, and nitrate of potash. The following compound manure has been used in conjunction with farmyard manure: 2½ lb. superphosphate, 1 lb. muriate of potash, 1 lb. nitrate of potash, and ½ lb sulphate of ammonia per rod. This is much too complicated for an ordinary grower, but shows that a suitable dressing would be a mixture of 3 parts superphosphate to 1½ part muriate of potash and 1½ part nitrate of soda.

The temperature of a soil is due partly to the sun's rays and partly to other sources. Whenever vegetable matter decays, there is always a certain amount of heat generated. Soils, therefore, in which there is a large amount of decaying vegetable matter are warmer than soils to which only mineral fertilisers are applied. This warmth-giving capacity is one of the advantages of organic manures.

## Artificial Manures in Forestry.

Partly in connection with the question of huling occupation of some of the unemployed, and partly with the laudable object of renewing and increasing the diminishing stock of growing timber in the country, the scientific as well as practical side of afforestation is attracting considerable attention. Among the questions that present themselves for solution, the following have received special attention:—

1. Is it possible by using artificial manures—
1. To accelerate the growth of young trees in the nurseries, and especially to provide the plants with a better root development.
2. To afford quickly and safely barren land which has not previously been cultivated, and likewise exhausted land, even under unfavourable conditions; and
3. To prevent the young trees from pinning, as they are observed to do when planted on land that has recently been cleared of timber?

The results obtained in Germany have now sufficiently proved that a quicker development as well as a better radication of the young plants in the nurseries is to be attained most satisfactorily by the proper use of artificial manures. In cases where it is intended to establish new nurseries and to grow leguminous crops for green manuring, it is recommended to apply a liberal dressing of basic slag and kainit, varying from 6 to 12 cwt. per acre according to the condition of the soil. It is also profitable to dig in half the quantity of each manure in the autumn, and to distribute the remainder during the winter. If green manuring has not been employed, the soil should be top-dressed with nitrogen in the form of nitrate of soda at the rate of 1½ to 4 cwt. per acre.

On the Continent the manuring of the nurseries is repeated after each clearance, the quantities of the mineral manures being reduced by one half from the proportion recommended for new nurseries.

If the soil is poor in lime, an application of this mineral is, of course, necessary, and it is recommended to use 20 to 25 cwt. of burnt lime per acre, to be distributed on a dry day, and carefully mixed with the soil.

If the nursery soil is very poor, and the lupins, which are chiefly used for the purpose of green

manuring, have only given a small crop of green substance, a top-dressing of 2 cwt. of nitrate of soda will prove useful. This quantity should be applied in two portions—the first half at the end of May or in the first days of June, the remainder four to five weeks later. It may be mentioned that foliage trees repay the more liberal dressing with nitrogen better than do the conifers.

## Experiments with Fertilisers.

The Ohio experimental stations at Wooster and Strongsville have, for a number of years, been experimenting with the various forms of commercial fertilizer, and comparing results with those obtained from barnyard manure. The average increase at the Wooster station has been greatest on plots receiving the largest applications of commercial fertilisers and barnyard manure. The most profitable results at Strongsville were obtained from plots where the nitrogen and potash were reduced to the lowest quantity. Phosphorus seems to be the dominant element in producing an increase of crop on that soil (poor in phosphate of lime).

In 1900, an experiment was begun at the station to test the effect of lime upon clover, on soil poor in clover production. The average yield on plots receiving 1,000 lb. of lime per acre, either alone or in combination with other fertilisers, was in some instances, ½ ton per acre larger than on the corresponding unlimed plots.

These results indicate that on soil which has become acid through exhaustive cultivation and the use of incomplete fertilisers, and on which clover refuses to grow, the addition of lime may restore the conditions essential to clover production.

The following conclusions are applicable to the kind of soil on which the experiments are being made, which is a thin sheet of glacial drift, lying upon and largely modified by shales and sandstones of the Waverly formation.

For the soils under test in these experiments, phosphorus is the controlling element in producing increase of cereal crops, and neither nitrogen nor potassium will produce a profitable increase except when used in association with phosphorus.

Except on soils which have been depleted by exhaustive cropping, the quantity of phosphorus in the fertilizer, as compared with nitrogen and phosphorus, should be much greater than that found in barnyard manure.

While the effect of nitrogen in the fertilizer is secondary to that of phosphorus on these crops grown in association with clover, the considerably larger increase produced by fertilisers containing nitrogen, especially in the wheat crop on the worn soil at Wooster, is evidence that this element cannot be entirely omitted from a fertilizer for such soils without loss of possible increase.

Potassium apparently occupies the third place in a fertilizer for these soils, yet it is evident that some carrier of this element is essential to the highest effectiveness of the fertilizer.

Apparently, crops immediately succeeding clover or other legumes require less nitrogen in the fertilizer than those more remote, while the ratio between the phosphorus and potassium needed is probably chiefly determined by the geological history of the soil.

## Prices of Fertilisers.

As the season for the purchase of fertilisers is now at hand, we shall give weekly for the next few months the London prices of the principal articles.

| The quotations are approximate and free on rail, London, cash payment. |                       | £ s. d. |
|------------------------------------------------------------------------|-----------------------|---------|

## Price of Potash Salts.

It is reported that the German Potash Syndicate came to the decision at their last meeting, held on the 23rd of last month, to make an advance in the export price of raw potash salts to the level of the prices of the year 1904, before the renewal of the combination. We do not at present know how far this resolution of the syndicate will affect prices of kainit, sulphate, and muriate of potash during this season, but we think buyers would act prudently to secure what quantities they expect to require without loss of time, if obtainable at last season's price.

THE  
**"BIBBY" CAKE**  
 IN THE FORM OF  
**"CAKETTES."**

"Send me two tons o' they nobb same as Mr. Brown is a using," was the colloquial way in which a new customer gave us an order the other day through our Market Representative.

This buyer had often thought he would like to try the "Bibby" Cake, but he belonged to the old school of farmers who are not easily led along untrodden paths.

He had, the previous week, been paying a visit to his neighbour, Mr. Brown, who had often spoken favourably to him of our Cake, and on looking over his stock and noting the extreme handiness of the "Cakettes" for Summer Feeding, he at last resolved to give us a trial order, and did so in the words just quoted.

It was doubtless the good condition of Mr. Brown's Cattle and the manifest handiness of the "Cakettes" which had finally broken down this buyer's conservatism: and now we have received a trial order we shall take good care to retain his business. Our method is a simple one: We put such value into all our Cakes and Meals as will insure the best results obtainable.

**THIS IS THE TRUE SECRET  
 OF OUR SUCCESS.**

It is, perhaps, hardly needful to point out in this place that the "Bibby" Cake is the most popular brand of Cake that has yet been made, and no other explanation but the one above mentioned will explain this fact.

It is not well, therefore, for buyers to be put off with a Cake which is offered as something "just as good": it is much better to say to the Cake merchant: "I must have 'Bibby,' and will not take a substitute."

The "Bibby" Cake has steadily won its way to

**THE PREMIER POSITION  
 IN THE PUBLIC FAVOUR,**

and of all the Cakes on the market is admittedly the best. In the form of "Cakettes" it is also the handiest; there is this further to be said about it:—the more carefully it is tested against other competing Cakes, the more certainly and with increasing emphasis will be the reply to those who offer a substitute:—"I MUST HAVE 'BIBBY,' PLEASE; THAT IS THE CAKE I WANT, AND I WILL TAKE NO OTHER."

#### THE BIRMINGHAM CHRISTMAS FAT STOCK SHOW.

This important agricultural exhibition opened on Saturday for the judging of the animals, and will be visited by crowds from the Midland towns as well as from Birmingham during the four days of the present week ending Thursday night. Very excellent displays of Shorthorn, Hereford, Devon, Aberdeen-Angus, Welsh, and cross-bred cattle came before the judges, and the butchers' prizes, so original a feature of this show, drew a large number of fat cattle, which appeared to be highly appreciated by the knights of the cleaver. The sheep and pigs came out admirably, and probably there have never been superior specimens of them in regard to quality.

We indicated last week the possibility of some of the Norwich chief prizetakers being superseded at Birmingham, and the event has proved this to be the case to a very remarkable degree; but H.M. the King's outcomes from the Windsor herds were more than usually good, and his Shorthorn steer, which was made champion, and his neat, shapely, first prize Shorthorn heifer are especially deserving. A noteworthy feature

in the cattle classes was the fewness of the yearling steers, alike in the Hereford, Shorthorn and Devon sections, no doubt attributable to the good foreign demand for bulls having caused a larger number of the male calves to be devoted to that object. The butchers award their own prizes in the two classes organised for them, and it is interesting for them to note the sorts of animals they favour, the firm handlers being apparently in high appreciation.

The rare excellence of the Southdown, Shropshire and Hampshire sheep and lamb classes were the subject of general remark in Bingley Hall on Saturday, the former two for high quality combined with substance, and the Hampshire's excelling in the same degree, so that nearly all the animals in that breed were noticed. All this is very indicative of the high character of the stock we may expect to have next week in the Islington Royal Agricultural Hall.

Very often the Birmingham decisions in the cattle division are reversed at the Smithfield Club Show, and it would be not at all surprising to find some of the Hereford ones meeting with that fate, inasmuch as they did not give perfect satisfaction to exhibitors and outsiders, especially in Captain Townshend's remarkably well-shaped, heavily-fleshed two-year-old steer being disqualified because of slight lameness.

#### A MARKET OF UNCONSIDERED TRIFLES.

There is one respect in which Mark Lane is very seldom considered. Its history from the foundation of Great Bear Quay to the repainting of the new Exchange in 1905 has had diligent chroniclers. Its side shows, flowers, photographs, &c., are not neglected. Its benevolent meetings and concerts secure publicity. But how few, even of agriculturists, are aware that Mark Lane is the greatest market in all England for the unconsidered trifles of trade?

Little specialties elsewhere unobtainable are easily procured at Mark Lane, and the owner of horses, of live stock, of poultry, of pigeons, can try an endless series of experiments in the

rations that the London corn centre can supply. Here come the pheasant rearers to buy buckwheat and the American caterers to purchase the same food, but in their case the use is for children, the Americans over here with their youngsters asking for buckwheat cakes at the hotels.

Here, of course, are lentils, which are useful food for live stock, and are also much used for imparting a peculiar odour to vegetarian restaurants. Here are sweet carrots, condiments that also are good food. On another stand you shall see the little oilseed, sesame, which plays so large a part in the East, and hard by are samples which the most experienced farmer may fail to recognise.

They are mawseed, teazleseed, nigerseed, pumpkin seed. With safflower and fenugreek he may be acquainted, and the old-fashioned still room and housekeeper's room know of dillseed and anise. Rubsen sounds more strange than it is, for in reality it is no more than a high-quality rapeseed. Carraways have their chief sale in London. Sorghum is a feature at Mark Lane; it is, as most farmers know by this time, a good serviceable type of millet.

The finer varieties of millet grown in Italy and South-East Europe can nearly always be bought in London. The selected white is the dearest. It is the same with sunflower-seed, which Mark Lane never is without, the white sort permanently heading the price list. Haricots twenty years ago were little in request except for the Italian restaurants. Today Mark Lane does a large business in them, and on Monday last we saw samples from California and Italy, from Hungary and Burma. The adjacent stand boasted butter beans from Lima and Madagascar, a third pea-beans from Canada, and a fourth runner beans from Russia, Holland and Prussia.

More mysterious is the demand for pea husks, for bean husks, for husk meal, for coffee husks, for cocoa shells, for pea chips, for fig dust, for coriander, and for cottonseed. But where there is demand there is also supply, and the choice of articles in Scotch goods is almost equally wide

and curious, including at least six grades of oatmeal, five of rolled oats, and six of groats. There is also brose meal, which no South Briton probably would trust himself to sample lest his ignorance should be a shame. We have heard indeed that it is only sold to buyers in kilts, but this we hold to be a popular error.

## Notes of the Week.

The fat stock shows are now the centre of attraction in the agricultural world. The first of the important shows, held at Norwich, may be classed as an average success, though nothing special to boast of.

The show of the Midlands at Birmingham is the attraction for this week, and next week follows the most important of all at Smithfield.

The two latter shows can now claim the prestige of age. The Birmingham Show is now celebrating its fifty-eighth annual exhibition, and the Smithfield Show, which claims to be the National Fat Stock Show of the kingdom, was founded 108 years ago.

The project of the Smithfield Club was first conceived by Mr. Joseph Wilkes in 1798. His name deserves to be remembered.

With the assistance of a few good and true men, the Duke of Bedford, Lord Somerville, the Earl of Winchelsea, and about twenty other gentlemen, he founded the club in that year.

The first chairman was the Duke of Bedford, and the secretary was Mr. Arthur Young, whose name is still remembered for his agricultural writings.

The amount paid away for prizes in the first year of the show's existence was 50 guineas.

For the present show the prizes offered amount to a total of £4,152.

James Stubbs, of Crewe, is a nice young man! He has confessed to having started four different farm fires in the locality, and to while away time between the fires he shot a few horses.

For the present he is restrained from indulging in such occupations, but he deserves to be scratched with the cat with nine tails.

Our unwelcome guests, the German gipsies, after roaming over many parts of the country, have been deported to Germany. "Speed the parting guests."

It is doubtful whether the German Government will allow them to land! We do not want them here, but still one cannot help feeling that they are objects to be pitied.

The weather is maintaining its series of records for this year. This month is said to be the warmest November on record.

Contrast that note with the following:—"It is really melancholy to think that at no very remote period our posterity will be placed in the same position as regards cider as we are with wine; when the apple trees, on account of the increasing low temperature, will only afford a penurious supply of sour fruit, and will be cultivated in forcing houses for the tables of the rich. It is now sixteen years since our orchards afforded a satisfactory crop." Thus wrote, in the year 1818, a gentleman on the deterioration of the climate of Great Britain.

Every farmer should study the report of the Agricultural Committee of the Tariff Commission.

It demolishes the fiction that the reduction in the price of the food of the people has been caused by the abolition of the Corn Laws.

It was not Cobdenism that caused cheap food, but steam transport, low freights, and the opening up of the corn-growing regions of the new world.

The evidence shows that for thirty years after the Corn Laws were abolished wheat was not any cheaper.

The evidence demonstrates also the deplorable condition of England's greatest industry, and the necessity of measures being adopted to alleviate the depression.

The continued decline of agriculture is a menace to our national security, and exercises a very bad effect on the general industries of the country.

The flour trade has its own particularities, and some sixty different patents from America alone contend for London bakers' custom. Here, however, Liverpool and Glasgow can show an equally surprising choice. It is in the less considered articles that Mark Lane is unrivalled as a centre of supply.

## AGRICULTURAL LAW.

*Advice of a Legal character is offered to Readers entirely free of charge. Particulars of cases should be addressed to the Editor: "MARK LANE EXPRESS," 3, Wellington Street, Strand, London, W.C.*

### Motors for Hilly Work—A Compromise.

In the King's Bench Division on the 23rd ult., before Mr. Justice Jelf and a common jury, the hearing was continued of the action brought by Mr. Edward F. Studd, of Oxtou, near Dawlish, against the Ivel Agricultural Motors.

Charles Hawkins, a blacksmith, and William Howard, a farm labourer, gave evidence as to Mr. Studd's futile efforts to make the plough work uphill, and James Cossier, steward of an iron company's colliery in Durham, who had tried a similar motor, stated that his experience with it was such that he concluded that the machine was not suited to agricultural purposes. This concluded the case for the plaintiff.

Mr. Graham, K.C., for the defendants, said their real point was that the motor never got a fair trial. Mr. Herbert J. Bamber, a consulting engineer, for the defence said the motor, when he saw it in a shed on plaintiff's farm, was badly damaged, as if it had been in a collision. Mr. Studd, jun., showed him the field where the motor was used. He would not say it was hilly, for it was mountainous (laughter)—and he did not think it was possible to drive any mechanical vehicle up that hill with a load behind it, or a plough taking furrows.

Mr. Haldenstein, on behalf of the plaintiff, withdrew the allegation of fraud.

Mr. Adolphus Hoffman, who sold the motor for, and who is manager of, the defendant company, denied that he said the motor would work as well in a hilly country as on flat ground. Plaintiff never mentioned that his farm was a hilly one. He also denied Mr. Studd, jun.'s, evidence. It was a fact that Parker, one of the company's men, reported that the country was hilly, and could not be worked on with the motor.

His Lordship said if witness's case was that he never mentioned anything about hilly ground, why did he not write to plaintiff and say that no such bargain was made while the correspondence was going on? Witness replied that he did not think it worth while. Witness was cross-examined at length by one of the jurors, after which his Lordship suggested a compromise, and after consultation in the judge's private room, Mr. Haldenstein announced that the parties had come to an agreement.

The record would be withdrawn, the defendants would take the machine back, and return the £308 to plaintiff, and pay him £100 towards his costs.

### Oxfordshire Agricultural Society.

The report of the general committee presented at the annual meeting of the Oxfordshire Agricultural Society stated that the general and financial condition of the society is satisfactory, and there has been a surplus on this year's working of £134. They tendered their hearty thanks to the president, the Hon. W. F. D. Smith, M.P., the Mayor and Corporation and the town and neighbourhood of Henley-on-Thames, also the local committee, for their generous liberality and valuable assistance at the recent show. The committee recommended that the cordial invitation to hold the show at Banbury in 1907 be accepted, and that the suggested dates—viz., Tuesday and Wednesday, May 14 and 15—be confirmed. The Mayor and Corporation of Abingdon have intimated that they would be very pleased to invite the society to hold their meeting in that town in 1908. It was suggested that the society ask Sir A. Henderson to be president for that year, and the committee asked for power to settle the date and other arrangements.

The report was confirmed, as was also the balance-sheet, which showed that the surplus for the year amounted to £134 13s., and that the surplus of assets over liabilities was £2,106 9s. 7d.

Various votes of thanks were then passed, and Viscount Villiers was elected president, whilst Sir Alex. Henderson, M.P., was chosen as president-elect for 1908.

NOTE.—The figures for the current year are approximate only.

### Cleveland Chamber of Agriculture.

A meeting of the Cleveland Chamber of Agriculture was held at Guisborough recently, Mr. R. E. Turton, Kildale Hall, presiding over a large attendance. In reply to a vote of thanks, Mr. C. Robinson, corresponding secretary to the Board of Agriculture, remarked that the Cleveland district was now better farmed than it was twenty-five years ago.

# HORSES.

## Notes and Jottings.

"He doth nothing but talk of his horse."  
—"Merchant of Venice."

LORD HARRINGTON has been writing again on the scarcity of good brood mares in the country, and he has modified his premium scheme, to which I referred recently to a considerable extent. I ought to have said that he has improved it and made it much more feasible. In the first place, he has added to the scope of it by admitting four-year-old mares. This is decidedly a move in the right direction. Two, three, and four-year-old mares will now be eligible for premiums in accordance with the scheme, if it should enter into the range of practical politics, and this is as it should be, at any rate, at first.

I AM inclined to think, however, that there is the heaviest draw on younger mares, and perhaps the biggest foreign trade is done in three-year-olds. At any rate it used to be the case when I saw more of the foreign trade than I do at present. This, of course, is not an argument against admitting the older mares. It is sound policy to admit her for financial reasons. A four-year-old mare can be used as a brood mare with advantage, and so we should soon be seeing the result of the outlay.

an immense sum of money, and the wasting of a great deal of it. But any Government might give Lord Harrington's scheme a trial, and though I question very much whether it would answer so well as Lord Harrington seems to think. But that it would keep some good mares, even if it failed to keep the best, in the country seems very likely, and under any circumstances, this is a thing to be desired.

THE measurement of Polo ponies still continues to be a burning question. It has been asserted by some of the advocates of raising the minimum height of ponies registered in the Polo Pony Society's Stud Book that there are ponies which under the Hurlingham Rules of Measurement have been registered as 14 hands 2 in. in height, which are from two to three inches over that height, and I have certainly seen Polo ponies shown which required no standard to tell me that they were considerably above 14 hands 2 in. But this does not seem to me to be any argument for increasing the height of ponies in the Stud Book. Rather does it point out that some reform is needed in the Hurlingham Measurement Rules. I am told that Polo ponies to carry heavy men cannot be found in any numbers standing 14 hands 2 in. I have even been told that there are few ponies under

I SEE a new class is to be introduced at the Polo Pony Show which will take place in March next, and it is one which will, I think, bring a good entry. Mr. Dunbar Kelly is giving a cup for the best Polo pony whose sire or dam is registered in the Polo and Riding Pony Stud Book, and which has been reasonably played during any season at any recognised Polo club. This is a very good class, but the question presents itself, Will it bring about any difficulties respecting height? It is, however, no use meeting trouble half way, and I certainly shall be disappointed if we have not a very strong and interesting class.

IT is a very noticeable feature at most of the leading Polo pony shows that ponies which have been good players have also been highly successful as prize takers. Mr. John Barker, who is one of the most successful breeders of Polo ponies, as there is no need to insist, makes it almost a *sine qua non* when buying a brood mare that she should have been a good player in her day. This is the way to keep the Polo Pony Society in touch with the men who play polo. Originally it was the men who played polo who had a great deal to do with the formation of the society and the success which has hitherto been attained by the Polo Pony Society—and it is a very remarkable success—has been in a great measure the result of the society being run on strictly practical lines. There does not seem to be any reason to think there will be a departure from this policy, but I would point out that it would be a wise thing to give players another class or two if possible, and Mr. Dunbar Kelly's cup is certainly a move in the right direction.

REFERRING again to Lord Harrington's letter, he states that we do not wish to encourage the breeding of third or fourth rate horses. In this, of course, he is quite right; there will be plenty of them if we aim at producing the very best. And the great question is, what are we to do with these misfits? That, of course, is a very crucial question. There will, of course, always be a market for second and third rate horses for the army, but Lord Harrington seems to think that the motor car will very considerably affect the demand for the general-purpose horse. And whilst he is writing to this effect, another practical man is writing to say that he sees that there is likely to be a demand for heavy and action van horses in the not very distant future. The motor and train service, he thinks, will bring this about, and the increasing demand for the rapid delivery of light parcels. If such a demand should arise, those who have stuck to their strong Cleveland Bays will have their day, and a demand for such a class of horse would do more to stimulate the breeding of Cleveland Bays than anything I know. The difficulty Cleveland Bay breeders have had to contend with during the last few years when the foreign trade has been rather flat, has been to find a remunerative market for those geldings which had not enough quality to make high-class carriage horses. But if the writer referred to should prove to be correct in his surmises, there will be a ready market for the stronger Cleveland Bay. What, however, will be the effect of the motor car and its increasing cheapness on the demand for horses is what no one can foretell with any accuracy. It is quite probable that all forecasts will prove as inaccurate as were the prophecies in railway days. So far as I can see, there is not likely to be a decreased demand for horses, and it is possible that both Lord Harrington and the anonymous writer I have referred to may both prove to be wrong.

THE LOOKER ON.

FIRST PRIZE HACKNEY PONY STALLION, HORACE JUNIOR.

Horace Junior was the winner of the First Prize for Pony Stallions, four years old and over, at the Hackney Horse Society's Show this year. His sire was Sir Horace, dam Lady Bounce, and he was bred by Mr. J. McMeeken, Mossbank, Dumbreck, but is the property of Mr. W. S. Miller, The Moorings, Dumbreck, Glasgow.

BY substituting the tattooing of premium mares on the gums to branding them Lord Harrington has removed one of the principal objections to his scheme. The tattooing is to be preferred for many reasons; it is less painful and is no blemish.

THERE does not seem any reason why Lord Harrington's scheme should not be tried, and the more especially as there does not seem to be any likelihood of practical results from the much-talked-of conference on horse breeding with the Minister of Agriculture, the proceedings at which are involved in as much mystery as a diplomatic secret which, if divulged, might let loose the dogs of war. Lord Harrington tells us there was much "talk-talk." That we were quite prepared to learn. He also tells us that the liberal expenditure of foreign governments was repeatedly referred to. That is also a thing which might have been expected. And again, he says that no scheme for improving the present state of things was formulated. Neither does that statement cause a great deal of surprise.

IT is, as I have frequently had occasion to point out, not the least use in relying on any great Government scheme involving the expenditure of

14 hands 3 in. which can carry a 15 stone man satisfactorily in a polo match.

ALL these statements may, for anything I know to the contrary, be accurate itself, but if they are they seem to me to point strongly to the fact that it is high time that the whole of the rules relating to measurement should be carefully reconsidered, and a fitting body to reconsider them would be a joint committee of Hurlingham and the Polo Pony Society. It certainly seems preferable if a 14 hands 3 in. pony must be played to play him as a 14 hands 3 in. pony, and not as a 14 hands 2 in. pony. But I would point out that it is one thing to say that many a pony standing over 14 hands 3 in. is the model of a Polo pony and a fine "player," and another to say that it is necessary to have ponies of that height if heavy men are to play. Believing that all the statements that have been made on the subject have been made in strict *bona fides*, I still think we want a little more evidence that there are not plenty of weight-carrying ponies of 14 hands 2 in. and under. One thing, however, it seems necessary to emphasise, and that is that anything approaching 15 hands is not a pony, and that the nearer you get to that height the more certainly does the pony type disappear.

## Sale of Hunters at Leicester.

Messrs. Warner, Sheppard, and Wade had an extraordinary sale of hunters on Saturday week, when Messrs. Hames and Son sent up the whole of their famous stud.

It is not often that such good weight carriers are sent up for sale, practically without reserve, and of the sixty-three lots all but four changed hands at an average price of £12 14s. The aggregate of the sale being 5,714 guineas. There was keen bidding for some of the best known animals. Fugleman, who bears a good character throughout the shires, reached the highest price, 300 guineas; while in another batch were Merry Thought and Seraph, and they changed hands at 240 guineas and 200 guineas respectively. Verger, a good ladies' hunter, reached 145 guineas, and Almoner was considered to be a bargain at 130 guineas. The best of the remaining lots were—Fedlar, 135 guineas; Quiz, 140 guineas; Humming Top, 125 guineas; Talent, 180 guineas; Ingob, 125 guineas; and Hopper, 210 guineas.

Among other lots in an especially good sale was Orchid, a steep-chaser, and a fine hunter sent from Yorkshire by Mr. W. A. Simpson, Northcliffe. He had carried his owner for four seasons without a fall, and at 170 guineas he could not be considered dear.

**Prizes for Suffolks at the Royal  
Show.**

A meeting of the Suffolk Horse Society was  
held at Ipswich on Tuesday to decide what sup-  
port should be given to the Royal Show. The  
secretary explained that he was directed to write  
to Sir Gilbert Greenall stating that they would  
contribute to the prize fund at Lincoln on con-  
dition that an aged horse class was added.

Sir Gilbert replied that he did not think the  
Royal Agricultural Society would see their way  
to give a class for aged stallions throughout  
the horse sections. In their opinion they held  
that the middle of the breeding season was a  
most unsuitable time to ask stallion owners to  
bring their best horses away from their work,  
and nobody wanted to see the breed represented  
by second-rate animals. What he (Sir Gilbert  
Greenall) had hoped to do was to keep the same  
classification as last time, but to increase the  
prizes to £15, £10, and £5. The latter would be  
the value of the classes next year, but unless at  
least one class was given, the Stock Prize Com-  
mittee would be bound to seriously consider the  
number of classes given by the Royal Society.  
Would the society be willing to let the money be  
given to one of the existing stallion classes? The  
secretary replied, from what he could gather from  
individual members, the society would be pleased  
to help in increasing the value of prizes in the way  
suggested in his last letter. He added that the  
breeding season in this district was mostly over by  
the date of the show. Sir Gilbert Greenall wrote  
that the granting of an aged stallion class in one  
section of the show would open the door to so much  
controversy. Other horse societies had settled, and  
treated them most liberally, the Shire Horse  
Society giving £100, and the Clydesdale Society  
£70. If he increased his donation to £10, would  
the Suffolk Society give £40 to augment the  
existing classes?

On the authority of Sir W. Cuthbert Quilter, it  
was understood, the secretary replied thanking  
Sir Gilbert for getting the horse-class prizes in-  
creased, and stating that, although he had found  
considerable difficulty in getting the committee  
of the Suffolk Horse Society to contribute towards  
the funds of the Royal, in addition to the £50  
challenge cup, the committee would give the re-  
quired £50, including the £10 donation, provided  
a class for stallions foaled previous to 1904 was  
instituted in place of the yearling class.

On the motion of Mr. W. B. Hustler, seconded  
by the Hon. Louis Johnstone, it was resolved that  
£40 should be given to the Royal on condition that  
the aged stallion class was substituted.

**Dosing In-Foal Mare.**

Would the 2 oz. dose of cod liver oil recom-  
mended for horses recovering from influenza affect  
a mare in foal gone half her time? She has got  
very poor, and I want to work her steady as long  
as I can.—W. F. S.

Answer: No doubt you are right as to our  
having recommended 2 oz. doses of cod liver oil  
for horses recovering from influenza, for it would  
be an excellent nutrient tonic to give in such a  
case, but when or why we have no recollection.  
Whether it was some one else's horse or related to  
your mare, whose condition you have thought  
since might be affected by it, we have no idea.  
Cod liver oil could be given with perfect safety to  
an in-foal mare at any period, but whether it  
would be the best treatment for your mare, who  
has got very poor, and whom you want to work  
steadily as long as you can, is another question.  
The chief thing seems why has she got so very  
poor, or what is the cause?

**PIGS.**

**Large Black Pig Society.**

An influential meeting of the members of the  
Large Black Pig Society was held at Launceston  
on Tuesday, presided over by Mr. John Bastard  
(St. Tudy). The report of the society was pre-  
sented by Mr. N. Stephens (St. Tudy). Among  
other things discussed was the best means of how  
to select judges for the large black pigs at the  
principal shows. It was generally accepted that  
the way in which judges had been selected in the  
past was not very satisfactory. After debate it  
was resolved that the judges should be selected  
by ballot from the list of members of the society,  
the resolution to be brought before the annual  
meeting of the L.B.P.S., held at the Agricultural  
Hall, London, during the show week.

**Notes and Jottings.**

IT is noticeable that when sheep are fed upon  
silage that they are much more attracted by  
the greener parts than by those which through  
greater fermentation are darker in colour. The  
greener parts are what are known as sour silage,  
produced at a heat not much exceeding 90 deg. F.,  
and possesses to the human nose an odour more  
like a stink than a scent. The darker-coloured  
silage, which has been subjected to a temperature  
of 140 deg., or more, has to us a much more at-  
tractive odour, somewhat resembling hay; yet it  
does not appeal to sheep in a similar manner,  
while that which has become blackened by heating  
to 170 deg., is the last to tempt them.

THE different kinds of ferments which are  
active in producing these features give  
different products, and different acids are formed,  
changing the flavour. The terms sweet and sour  
as applied to silage are misleading, as all fodder  
which has been under fermentation contains  
acidity.

IN feeding hay to sheep something may be  
learned from the partiality of sheep for the  
less fermented silage. Silage and hay have much  
in common, as the same ferments influence both;  
but the darker silage more closely resembles the  
darker hay; in fact, they are practically the  
same, the difference being that sweet silage is  
over-dried grass admitting an excess of air, and  
over-burned hay is too moist grass. That is what  
is drier than is desirable for preserving under  
pressure is the equivalent of the too green grass  
cured in a stack to which additional pressure is  
not applied.

SILAGE or hay loses feeding value accordingly  
as fermentation has been allowed to proceed,  
and it may be an instinct of the animals that  
guides them to the more nutritious; but beyond  
this there is the fact that over-dried hay is  
directly injurious to sheep, owing to its bad  
influence on the kidneys, as sheep are liable to  
kidney troubles, especially when through con-  
tinuous rain the loins are constantly wet, carrying  
chill to the important organs about them, which  
often results in death. The quantity of heated  
hay given to sheep should therefore be limited,  
and it is doubtful if it is ever really advantageous  
to give it. It is often used to give a "nose" to  
the fodder, but if the hay is sweet and good it is  
not necessary, for sheep are ready to detect what  
is good for them.

AS a means of tempting sheep to eat musty hay  
it serves a purpose by overcoming the fusty  
smell; but musty hay and overheated hay are not  
desirable foods. A large amount of mouldy and  
fusty hay is put before sheep, and much of it is  
trodden into the ground, while good hay is well  
cleaned up. It certainly pays to make good hay  
even for sheep, but we know some sheep districts  
where mouldy stacks are very common; however,  
with the more general use of the mechanical  
swath-turner, there is not much grass or clover  
left to grow into the second crop before it is  
turned, and the bottom of the swath is better dried  
before going to the stack.

IT is satisfactory to see that the Ryeland sheep  
is gaining popularity abroad. There has been  
quite a number of shipments during the past few  
months. Well as sheep may thrive which have  
been on rich pastures from time immemorial, there  
are plenty of places for those which built up their  
character and constitution on less favourable soils,  
and these are well suited to fill the gap abroad,  
where the conditions are not always of the best.

THE Ryeland attained notoriety centuries before  
many of the well-known breeds of to-day had  
been developed, and though the exceptionally fine  
quality of the wool brought their greatest fame,  
they were of good repute for their mutton. It  
is generally conceded that the Clun Forest breed,  
which has long been known—long before New  
Zealand lamb was commonly sold as Clun mutton  
—in the West End of London as the choicest  
meat the country produced, had as foundation the  
original Ryeland.

THE breed originally was raised on the poor  
lands which for their better aptitude to  
produce rye than wheat, were called the Ryelands,

and was the smallest sized sheep in the country. When the improvement, which was brought to bear on the British breeds from a hundred to a hundred and fifty years ago, it looked as though the Ryeland would most probably disappear by the substitution of bigger breeds then dominating.

**E**ARLY attempts at crossing with Long Wools were not particularly satisfactory, as the crosses appeared too violent, and subsequent crosses most disappointing. However, as has practically always been the case where a British breed of sheep was in a critical position, there were men with the skill of breed makers at hand. These worked patiently and with a direct object, maintaining the valuable features of the Ryeland, and adding to them the size of the larger breeds, until we find them to-day, a sheep valuable both for wool and mutton, suitable for the altered agriculture of the country, and well adapted by the variety of blood in them to adapt themselves to widely-differing conditions of soil and climate abroad.

**W**HEN sheep are on roots which have not well matured, and which are causing scour or hoven, great care should be exercised that the cake or meal given the sheep are not fusty or stale, as these alone are sufficient to cause these troubles. Meal is very liable to get stale or to ferment if kept long in bins; and cake, especially cotton cake, is very absorbent of moisture, and therefore liable to go mouldy. In a wet, humid atmosphere, such as has prevailed lately, the likelihood of these conditions is especially great, and those who are having trouble with their sheep should not fail to ensure that the foods are absolutely sweet.

### A Prolific Ewe.

The *Melbourne Argus* reports that Mr. A. E. Henderson, of Swinton, Tasmania, has a most prolific Shropshire ewe, she having raised in four years thirteen lambs. The sire of this ewe was the imported champion ram Centurion, bred by Mr. A. E. Mansell, and now the property of Mr. Geo. Simonds, of Stonor, Tasmania. Four daughters of this ewe (an imported ewe) have given birth to two lambs each the last three years, giving a return of thirty-seven lambs from the mother and daughters in four years.

### Rugby and the Warwickshire Show.

A special meeting of members of the Rugby and Dunchurch Agricultural Association was held at Rugby on Monday to consider a letter from the secretary to the Warwickshire Agricultural Society, asking if it was desirable that the county show should be held at Rugby next year, and pointing out what the requirements would be.

Mr. T. S. Townsend, C.C., presided, and there was a large attendance, which included, by request, the chairman and clerk of the Rugby Urban District Council, who favour the holding of the show in the town.

It was pointed out that thirteen years had elapsed since the county show was held at Rugby, and that then the local society amalgamated with the county organisation. Since that time the local society had been opposed to the county show being held in the town. Now, however, many of the townspeople favoured a visit next year, and it was hoped that the present site of the Rugby show and land adjoining would be available.

The meeting unanimously favoured the proposed visit, and it was decided to call another meeting for to-day (Monday) to consider the terms of amalgamation which will be submitted to the county society.

**Cheshire Farm Fires.**—The man James Stubbs, whom the Crewe police arrested in the garden of two cottages that had been set on fire, has confessed that he started a number of farm fires in Cheshire. Four specific charges were brought against him, but these did not cover all the offences he had admitted. One fire was on the farm of Joseph Steel, of Church Coppenhall. The family were awakened early one morning by the moaning of a calf, and they found the shippoon on fire and the flames extending to the house. The house doors had been fastened on the outside, but they were forced, and the family escaped. Another fire did damage to the amount of £20 to buildings on the farm of William Peake at Coppenhall. On the same night there was a fire on the farm of William Peake at Coppenhall. On the same night there was a fire on the farm of James Horton, Haslington, and the prisoner said that as soon as he had set one fire going he rushed off and lighted the other. Besides the fires that he admitted causing, the prisoner said he had shot a horse. On Tuesday he was committed to the assizes for trial.

### Notes and Jottings.

**T**HE Christmas fat stock shows are now in full swing, and the weather at the time of writing altogether phenomenally mild. Travelling about many districts of the country during the past week, cattle in every direction appear to be enjoying themselves in the pastures as though even summer were still lingering with us. Anyway, it is with the grass farmer helping the winter on cheaply and rapidly, for the shortest day will soon be upon us. Unfortunately for the heavy beef trade, these favourable circumstances to the grazier have an adverse effect both upon demand and prices, and in spite of American reports strengthening the belief that prices must rise very appreciably, and also that in one or two of our home markets higher prices are ruling for choicest stock, yet in the main parts of the country, and as far as good average fat stock are concerned, prices are simply rotten.

**O**NE of the oldest agricultural societies in the country, and one of the most generally helpful to the improvement of cattle breeding, held its annual meeting last week. This was the show commonly called Lord Tredegar's, owing to that estimable nobleman practically defraying the entire cost of carrying on the exhibition, which is held in the comfortable sheds of the Newport Cattle Market, Monmouthshire. The schedule is a comprehensive one, and gives opportunity to all classes of breeders and feeders to display their judgment and abilities in cattle breeding and feeding. Though only two breeds (Shorthorns and Herefords) are what may be termed fully catered for, yet there are classes in two or three sections without restrictions as to breed. The display of Shorthorns and Herefords in their breeding classes was one of the most attractive of the season, the stock having now donned their winter coats, and are in generally splendid bloom. Champion honours in both sexes went to the Shorthorn breed.

**O**NE or two questions appear to be creating considerable discussion in Ireland at the present time and for some time past, indeed. The most important of these is the question of winter dairying, and does it pay? Irish farmers, as a rule, do not appear to take kindly to the in many districts of England and Scotland comparatively new method of dairying which, in lieu of simply a summer dairy, maintain pretty well an even supply of milk weekly from January 1 to December 31, the milk, in some instances, being supplied direct to the dairymen in our towns and cities, in others, being used at home for the production of butter and for the feeding of pigs and rearing of calves, whilst still a third system uses the milk during the late spring and summer for converting into cheese, and then in winter for dispatching per rail to the various purchasers (wholesalers) in the large towns.

**T**HERE can be no two opinions in the present day as to which of these three systems of disposing of the milk is the more profitable, cheese-making during summer and milk-selling during the winter enabling premium prices to be obtained for the produce the year round. Cheese has for some two or three years past been realising quite profitable prices, whilst at most recent fairs and markets exceptionally high prices have ruled for the best dairies. Then with cheese-making the by-products of whey for pigs and whey butter for market amount between April and November to a very substantial sum per cow to add to the price obtained for the cheese itself; and the dairyman who only sells milk during the winter season is able to command a much higher price for those five or six months than the man who expects his dairyman to take all his milk during the summer as well.

**T**HE question as to whether winter dairying pays or not is a very vexed one in any country, and several outside matters are affected and must have their say in the matter. One of these questions aside is the immense quantity of manure that is made where a winter dairy is kept in up-to-date form, and thus the fertility of the farm is very much more cheaply maintained than when there is no winter dairy, and the cows for the summer dairy simply take care of themselves.

Then there is the question of growing a good acreage of roots each year, in the growth of which the rich leaps of farmyard manure help very greatly, so that in respect of these two things the needed roots are for the most part grown from the manure which their being grown enables to be made, the two things practically living and working their own level, so that in a measure the expense incurred is its own paymaster so to speak.

**T**HE most important item affecting winter dairying in many districts is the greater amount of labour needed. For many weeks day light is very scarce, and the outside labour requires practically two men to do one man's day's work, whilst in the buildings where the usual number of hours have to be worked by the aid of artificial light in a great measure the expense is very heavy. More hay is needed, too, and more costly artificial or extraneous food. All things considered, there is no doubt winter dairying requires a very carefully-managed balance sheet if a profit is to be shown at prices that have been the rule for some years past. Were a general advance in the price of milk and butter to take place it would alter things immensely. Pure milk ought not to be sold at less than one shilling per imperial gallon during the winter season where railway expenses have to be deducted, and by the same rule butter ought not for three months to be marketed at less than 1s. 4d per lb. wholesale. There cannot be a case of fair profit made out at lower rates than those mentioned where the best quality of both articles is produced, and where good living prices are paid to the labourers concerned, prices that will prevent them forsaking the country homes for the more cheerful, but in other respects undesirable, surroundings of town life.

**A**NOTHER question affecting discussion yet in Ireland is the Canadian store cattle business, but as this is for the present in abeyance with the powers that be, it is to be hoped Irish as well as English and Scotch breeders will have no need to vex their souls therewith, and will employ their time and talents to much better purpose by considering and adopting the best means to breed an increased number of improved cattle at home.

**L**OOKING broadly over results of dairy farming as compared with ordinary or mixed farming, upon the whole facts appear rather to favour dairy farming as the more profitable system. Many farmers aver that milk farming, if we may coin an expression, has been the salvation of thousands of British farmers, and the manner in which the system has increased of late years also supports the theory that more money is made thereby. If a bigger fortune is not realised, at any rate on the face of things expenses are more readily met, and the two ends more nearly meet, as a rule, upon those farms where dairy farming is practised. An increasing population and the spread of temperance in principles, too, is causing a much greater demand for milk than has ever been previously known, which may, and it is to be hoped will, shortly end in better prices being paid to the producer.

**W**ITH regard to the management of dairy cows, many of our professors—and professors who have never indulged in the practical side of managing milkings—one branch of which is the performance of milkings—are indefatigable in their advice as to milking, with dry hands. Now, though, when witnessing a milking competition one almost invariably is led to form the opinion that dry-handed milking is most cleanly; yet there is not as much in this as appears at first sight, and to those who have practised both methods the verdict is loudly in favour of wet-handed work. It is much easier for the cow, and very much easier for the operator, whilst it is also much more moral. When the offspring does the milking there is no reason to suppose who has not watched with delight how the little stranger, or the bigger, more developed, obstreperous calf fawns at his mouth whilst he is drawing the rich draught from his dam's udder! Yes, Nature goes in for wet milking there is no disputing the fact, and as far as the hand is concerned, when quite clean to commence with, there is no greater dirt impurities communicated with the wet hand than with the dry, and the cow is much better satisfied.

**R**EFERRING to the increased demand for milk consequent upon increased population and other changes in social life as connected with it, we read in several papers from the Western Continent how very rapidly the great cattle ranches of that continent are passing away, being converted into farm lands and home-steads, which in their turn, owing to the land being brought under cultivation, bring an increase in population there. The one farmstead is knocked together, extra hands in numbers are soon required, and habitable dwellings, however humble, are required for these; then another homestead is shaped near to until in an incredibly short space

## TAMWORTHS.

**THE Melton Constable** celebrated Herd of Pedigree Tamworth Pigs. Prize winners at Norfolk, Suffolk, and other shows. Championship Cups Smithfield. Several recently exported to Continental and Colonial herds.—Apply R. OWEN GODDARD, Estate Office, Melton Constable, Norfolk.

By Lupulin.

## The Borough.

My remarks last week might be repeated to day, as the position of our market has not changed. Traders are still "whistling for the wind" of demand, which does not arrive, and they can only repeat the words of the classical poet: "Tis hard, but patience must endure, and soothe the wounds it cannot cure." The only comfort that can be found is in contemplation of the future. All are now agreed that there is no probability of any revival of business this year, and as regards the possibilities of next month, there is considerable difference of opinion.

I am assured by some, whose reports from their customers are promising, that as soon as the Christmas holidays are passed brewers will be buyers; but there is the condition, that the renewal of their demand will depend upon their ability to place their orders at very moderate prices. On the other hand, there are merchants who have little or no faith in the future, and these seem to anticipate that only a dragging, hand-to-mouth trade will continue until stocks are actually exhausted.

There is little doubt that the bulk of the small crop of new hops has been transferred into the hands of consumers, but it is not clear whether they have been bought for present or future use. I am inclined to think that the low prices has induced brewers to buy for holding, rather than for immediate consumption, and if my supposition should be correct, the sales that have taken place will not assist the maintenance of values, as they will tend to accentuate the independence which has been the main cause of our recent depression.

Surrounded as we are with only vague surmises, it is perhaps prudent to say but little. We have no real knowledge beyond the facts that the trade to-day is so extremely dull it may almost be described as non-existent, and that there are no indications of early improvement. The confidence of some holders that a better time is coming sooner or later is just sufficient to keep values fairly steady, and I sincerely trust that their faith may be rewarded by the sight of higher prices than are at present quoted.

I am informed that "grubbing" of hops is going on to a somewhat considerable extent in the southern counties, and I understand that many Midland growers are adopting a similar course. While I am unable to endorse the recommendation made by the writer of a letter that appeared in most of the local papers a few weeks ago, for the entire abandonment of the industry in England, I am disposed to support the idea of reduction of our hop area to about 40,000 acres.

Only the most suitable land for hop-growing should be cultivated, as with the improved methods of culture and training we should be able to produce from this acreage quite sufficient to meet our reduced local demand. Moderate average crops of, say, 12 cwt. per acre, added to the inevitable foreign imports, will certainly yield better profits to growers than the risks which attend the great variations we have recently experienced. It may also be advantageous to the industry if brewers sometimes feel the pressure of scarcity.

It may be argued that we shall thus be opening the door to our competitors, but surely it cannot be opened wider than it is at present, and considering that consumption of hops is limited, it certainly appears that if the supply could be nearly adjusted to the actual demand the financial results would be better all round. I admit the certainty of our planters have had no occasion to complain of their profits, but if we take the advance of the industry we cannot be sure of any advancement. The argument in favour of reduction of acreage therefore seems to be incontestable.

The East Kent Agricultural Society annually offers a cup for competition by hop growers. This has been won this season by Mr. W. Lillywhite, of Thunington, Canterbury, the reserve award being given to Mr. S. Neame, of Selling. Both these gentlemen were winners in the competition this year at the Brewers' Exhibition.

## Foreign Notes.

### America.

The markets on the other side of the Atlantic continue to be very quiet; there is comparatively

little export demand, and the local brewers are holding back, expecting that quotations will be lower in the early future. On the other hand, growers are generally disinclined to accept reduced offers; thus there is no room for dealers to operate, and it is not expected that business will improve to any extent until the opening of the new year. On the East Coast growers appear to be holding their own fairly well, the qualities of the New York State growths being generally satisfactory, but the low average of Pacific Coast hops makes buyers very shy, and the tendency of values is distinctly downward.

### Nuremberg.

The strength that has characterised this market is well maintained, although demand has not been quite so active during the past few days, owing mainly to the falling off in the export trade. Local consumers have, however, bought pretty freely, and choice samples have advanced in value by a few shillings. The arrivals from November 15 to 22 amounted to 3,600 bales, the sales for same period being 4,900 bales. Holders are very firm in their quotations, and the most recent reports speak of firmness with an upward tendency.

### Belgium.

The healthy position of the German market has not yet been felt in Brussels, where business remains very quiet. Quotations remain at about same figures as reported last week, but holders are very anxious to realise; it therefore seems probable that selling prices will be reduced.

### France.

The fourth and last hop fair of this season was held at Dijon, November 20. Some dealers attended, but in consequence of most of the planters having sold their produce, none of them were present. There has been much disappointment at the prices realised, the small crop having induced the expectation that high rates would rule. A few growers, who usually are late sellers, are holding their growths, but the quantity in hand is quite unimportant.

## The German Acreage and Crop in 1906.

The following figures, extracted from the returns issued by the Imperial Agricultural Statistical Department in Berlin, give the results of the hop season of 1906, and also furnish some comparisons with previous seasons. They have the merit of being absolutely reliable, as in each district there is resident a State official who is in personal contact with all the farmers, and who is therefore in a position which enables him to ascertain exactly what each man is doing.

Returns made to these officers are obligatory, and can be checked by actual knowledge; they are therefore far more valuable than the estimates published by our Board of Agriculture, which are based upon observations of a very partial character, the information provided by our farmers being purely voluntary, and in many cases the details asked for are withheld.

Our returns must consequently be only comparative and vaguely approximate. It is to be desired that when Government issues figures they should be absolutely certain, and in this respect it appears that we have something to learn from the systematic procedure of our painstaking Continental rivals.

These returns are, of course, published in German, but in order to make them more comprehensible to my readers, I give the results in approximate English quantities:—

|                   | No. of growers. | Acreage. | Total crop. | Average per acre, 1906. |
|-------------------|-----------------|----------|-------------|-------------------------|
| Prussia .....     | 100             | 4,130    | 12,838 cwt. | 130 cwt.                |
| Bavaria .....     | 831             | 59,507   | 239,840     | 400 "                   |
| Wurttemberg ..... | 190             | 12,407   | 47,270      | 380 "                   |
